Military Department

R. VAN MCCARTY

MAJOR GENERAL

OFFICE OF THE ADJUTANT GENERAL

1 NATIONAL GUARD ROAD

COLUMBIA, S. C. 29201-4752

9 August 2024

SUBJECT: Preconstruction Site Selection (PSS), Environmental Condition of Property (ECP), MTA McCrady Training Site Multi-Purpose Machine Gun Range (MPMG) MILCON PN 450377

1. This memorandum documents an update to the 2013 Pre-Construction Assessment (PCA) that was prepared by South Carolina Army National Guard Environmental Professionals (Mark Mohr, Deputy Conservation Manager) in support of the proposed military construction (MILCON) of a Multi-Purpose Machine Gun Range (MPMG). The PCA was prepared per the requirements of the Army National Guard's "Environmental Condition of Property Process Handbook" (ARNG June 2011). This memorandum incorporates ASTM International's standard E1527-21 and the Policy Memorandum "Updated Policy/Supplemental Guidance for ARNG ECP Documentation" (ARNG 2023).

2. SITE RECONNAISSANCE
    a. A site reconnaissance was conducted by Virginia (Geni) Theriot on 9 July 2024. The site reconnaissance did not indicate any substantial changes to the ECP of the property since the 2013 PCA. Photographs from the site reconnaissance are attached.
    b. Ms. Theriot is the SCARNG NEPA/ECP Manager and an environmental professional with a Masters in Environmental Resource Management, more than twelve years of full-time relevant experience, and meets the definition of Environmental Professional as defined in 40 CFR 312.10.

3. DOCUMENT REVIEW
    a. A search of the following was conducted on 9 July 2024: South Carolina Department of Environmental Services, EPA NEPAssist, Richland County GIS Tax Parcels, a search of environmental cleanup liens, and a search of historical aerial photographs. The most recent, 2023 aerial photograph, Figure 1, is included as an attachment.
    b. According to the most recent Operational Range Assessment (ORA) Cycle Advanced Assessment Report–Fort Jackson / McCrady Training Center (MTC), South Carolina (United States (U.S.) Army Fiscal Year (FY) 18-22), the 62 ranges on Fort Jackson consist

of firing ranges, small arms ranges, and training areas totaling 14,895 acres. Based on data collected during the 2008 Phase I Assessment, the 2014 Phase II Assessment and the 2023, ORA, the proposed MPMG construction will occur in an area of operational ranges at MTC. The ORA concluded that 51 ranges (including the proposed MPMG), including impact areas, medium and large caliber firing ranges, small arms ranges, and training areas that either contain artillery or mortar firing points or known or suspected dudded areas or have received heavy historical munitions usage, were categorized as Inconclusive. Ranges are categorized as inconclusive to indicate the need of further analysis through Phase II Quantitative Assessment. All ranges classified as inconclusive will be included in the FY23-27 cycle of ORA's to meet DoDI requirements. The ORA is attached.

c. The document review did not indicate any substantial changes to the ECP of the property and/or property use limitations since the 2013 PCA.

4. INTERVIEWS
   a. An interview with Mr. Jim Cook, MTC Sustainable Range Program Manager, was conducted on 11 July 2024. Documentation of the interview is attached.
   b. The interview did not indicate any historic known or suspected releases or any substantial changes to the ECP of the property since the 2013 PCA.

5. CONCLUSION – The South Carolina Army National Guard (SCARNG) has had a license for the MTC since August 1986. It is believed the SCARNG had a real estate agreement before 1986 but the only documentation found to support that is an outgrant dated 1969.
   a. The site reconnaissance/document review did not indicate any substantial changes since the 2013 PCA. SCARNG has sufficient in-house expertise to validate the PCA and concludes that additional expenditure of funds for this effort is not warranted at this time.
   b. As discussed in the 2013 PCA, in accordance with Department of Defense (DoD) policy defining the classifications, the target property has been overall classified as Category I with UXO areas classified as Category III. All UXO areas will be cleared by USACE before the beginning of construction. Therefore, the SCARNG has determined the subject property to be suitable for the proposed MPMG construction.

6. The point of contact for this memorandum is the undersigned and can be reached at 803-730-2178 or virginia.theriot@scmd.sc.gov. Questions or concerns can be directed to the undersigned.

Virginia Theriot

Virginia Theriot
SCARNG
NEPA/ECP Manager

Interview
Mr. Jim Cook
McCrady Training Center Sustainable Range Program Manager
July 11, 2024

1. Are you aware of any environmental cleanup liens against the subject property that are filed or recorded under local, State, or Federal law? Answer: None, there is no known environmental cleanup liens on the proposed MPMG construction site. USACE will conduct UXO clearance prior to the start of construction.
2. Are you aware of any engineering controls, land use restrictions, or institutional controls that are in place at the site and/or have filed or recorded under local, State or Federal law? Answer: Storm water retention control measure are maintained throughout McCrady Training Center. During construction, compliance with the National Pollution Discharge Elimination System (NPDES) construction permit and a project-specific Storm Water Pollution Prevention Plan (SWPPP) will ensure sedimentation effects are minimized. There are no documented land use restrictions for this location. Institutional controls measures are as follows; Spill Prevention, Control and Countermeasure (SPCC) Plan, Hazardous Waste Hazardous Material Management Plan (HWHMMP) and applicable Hazardous Materials/Waste programs for current operations.
3. Do you know of any past uses of the subject property indicative of releases or threatened releases? Answer: No uses indicative or releases or threatened releases. The proposed MPMG range would be located, within the existing impact area, on an existing active range complex managed by Fort Jackson. The Impact Area is an existing area where weapons, bombs, explosive munition, etc. have been and can be fired or detonated. Fort Jackson has conducted field artillery operations in the range complex since World War I.
4. Do you know of specific chemical releases that have taken place at the subject property? Answer: There are no known chemical releases that have taken place on the subject property.
5. Do you know of spills or other chemical releases that have taken place at the subject property? Answer: There are no known spills that have taken place on the subject property.
6. Do you know of any environmental cleanups that have taken place at the subject property? Answer: There have been no known environmental cleanups that have taken place on the subject property. The closes Solid Waste Management Unit on McCrady Training Center is over 5 miles from the proposed MPMG construction.
7. Are there any obvious indicators that point to the presence or likely presence of contamination at the subject property? Answer: No, there are no obvious indicators of the presence or likely presence of chemical contamination or other spills at the subject property.

07 09 2024 09 08

07 09 2024 10

Fort Jackson / McCrady Training Center, South Carolina

May 2023

Background

DoD uses and manages operational ranges to support national security objectives and maintain the high state of operational readiness essential to its mission requirements. The Department conducts non-regulatory, proactive, and comprehensive operational range assessments (ORAs) to support the long-term sustainability of these ranges while protecting human health and the environment. The purpose of an ORA is to determine if there is a release or substantial threat of a release of munitions constituents (MC) from an operational range to an off-range area that exceeds an applicable regulatory standard or creates a potential unacceptable risk to human health or the environment.

The Army ORA effort was developed to address DoD requirements detailed in DoD Directive 4715.11 (10 May 2004) and DoD Instruction 4715.14 (15 November 2018). The overall objective of the ORA is to assess operational ranges/range complexes to determine if an off-range MC release or substantial threat of an off-range MC release exists; if an off-range MC release exists, does it exceed an applicable regulatory reporting standard; and if an MC release or substantial threat of a release exists, determine whether it creates a potentially unacceptable risk to off-range human health or the environment. Army ORAs assess potential off-range migration of MC along surface water system and groundwater migration pathways.

Range Overview

The combined Fort Jackson / McCrady Training Center installation boundary encompasses approximately 51,961 acres in Richland County, South Carolina. The South Carolina Army National Guard (SCARNG) holds a nonexclusive license for training operations on approximately 15,267 acres of the eastern portion of Fort Jackson. The ORA-eligible ranges within Fort Jackson and McCrady Center included 166 operational

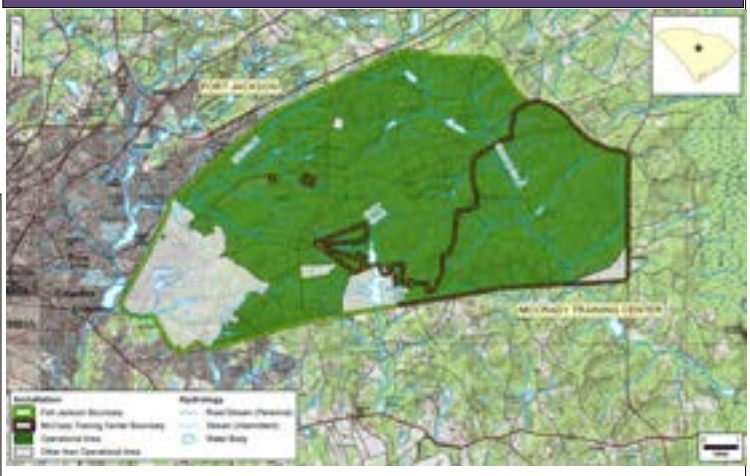
Operational Range Assessment Findings (05/2023)

Based on updated sampling data, an off-range release currently exists with potentially unacceptable risk to off-range ecological receptors from lead in surface water on Fort Jackson. Ranges associated with the Mill Creek watershed should be recategorized as Referred. Also, given low water hardness, metals detection in blank samples, and data qualification of non-detected values, the non-detections of metals in the dataset are considered uncertain and therefore the remaining ranges should be recategorized from Unlikely to Inconclusive.

Next Steps

Additional sampling should be considered to assess the source of elevated metals concentrations in Mill Creek surface water on Fort Jackson. In addition, Fort Jackson and McCrady Training Center's operational ranges should be included in the FY23-27 cycle of ORAs to meet DoD Policy (DoDI 4715.14) re-assessment requirements.

Map of Range/Range Area



Range Overview (continued)
ranges covering 44,370 acres, which include 132 maneuver/training areas, 10 firing ranges, 22 small arms ranges and 2 impact areas. Additionally, there is a non-operational cantonment area consisting of 7,591 acres.

Previous ORA Investigations
Fort Jackson and McCrady Training Center were evaluated in 2008 under separate Phase I ORA Qualitative Assessments that consisted of collecting, evaluating, and presenting available data to establish if there was a potential interaction between the on-range sources of MCOC and off-range receptors (source/receptor interaction). The Phase I ORA evaluated 62 operational ranges at McCrady Training Center and 104 operational range areas at Fort Jackson. The Phase I ORA identified small, medium, and large caliber munitions, pyrotechnics/obscurants, and other munitions as the primary MCOC sources at Fort Jackson and McCrady Training Center.

At McCrady Training Center, 14 ranges were categorized as Unlikely that a source/receptor interaction could occur because no potential source/pathway receptor interactions were identified. The other 48 ranges at McCrady Training Center were categorized as Inconclusive. Training conducted at the Inconclusive ranges included munitions which constituted a source of MCOC. Potential surface water system migration pathways were identified that originated from three primary watersheds: Colonels Creek Watershed, Gills Creek Watershed, and Cedar Creek Watershed. Potential groundwater migration pathways included the Middendorf aquifer, which was widely used for drinking water.

At Fort Jackson, 53 ranges at Fort Jackson were categorized as Unlikely because no potential source/pathway receptor interactions were identified. The ORA concluded that 51 ranges were categorized as Inconclusive. Training conducted at the Inconclusive ranges constituted a source of MCOC. Potential surface water system migration pathways were identified within five primary watersheds: Colonels Creek Watershed, Gills Creek Watershed, Wildcat Creek Watershed, Mill Creek Watershed and Cedar Creek Watershed. Potential groundwater migration pathways

Previous ORA Investigations (continued)
from the Inconclusive ranges included groundwater in the shallow, perched aquifer.

The Inconclusive ranges were recommended for further evaluation through a Phase II.

Previous Phase II ORA
The 2014 Phase II assessment was combined for Fort Jackson and McCrady Center as the installations were immediately adjacent. The Phase II Assessment evaluated 163 operational range areas that occupied a total of 51,961 acres between both Fort Jackson and McCrady Training Center. The Phase II multi-season sampling event was conducted from 2009 to 2013. The investigation included surface water and sediment samples from five downstream and three reference locations within Colonels Creek Watershed, Cedar Creek Watershed, and Gills Creek Watershed. Surface water was analyzed for metals, propellants, and explosives and sediment was analyzed for metals and explosives. Additionally, benthic macroinvertebrate surveys were conducted to characterize overall stream health. Surface water, sediment, and benthic macroinvertebrate sampling data indicated MCOC were not migrating off-range via Colonels Creek or Cedar Creek. Because Cedar Creek surface water and sediment sampling data were considered conservatively representative of Mill Creek conditions, these data also indicated MCOC were not likely migrating off-range via Mill Creek. Surface water and sediment sampling data from the Gills Creek watershed included lead and copper concentrations exceeding project action limits (PALs). Based on these results, a Screening Level Ecological Risk Assessment (SLERA) was performed to better assess the conditions. The SLERA performed on the results from Gills Creek indicated that the potential for adverse ecological health effects from exposure to sediment in Gills Creek at the operational range boundary is likely low. However, based on the low pH in surface water and low total organic carbon in sediment, these metals may become mobile and bioavailable.

Groundwater sample results showed that concentrations of cyclotrimethylenetrinitramine (RDX) were present in groundwater and had migrated to

Previous Phase II ORA (continued)

monitoring wells near the operational range and installation boundary, upgradient of off-range wells used for drinking water. It could not be determined if RDX had migrated off the operational range area. A separate subsequent investigation outside of ORA was launched and is ongoing under the Installation Restoration Program to address this issue.

Advanced Assessment Overview

The 2023 Advanced Assessment for Fort Jackson and McCrady Training Center refined the CSM through the collection of updated source, pathway, and receptor data and included a review of existing analytical results from previous investigations. Recent data showed there are 148 operational ranges covering 51,322.78 acres, which include 55 maneuver/training areas, 56 firing ranges, 4 dudded impact areas, 15 non-dudded impact areas, and 18 historic impact areas. Additionally, there are approximately 7,591 acres of non-operational cantonment area.

Surface water and sediment samples were collected under the Advanced Assessment to address data gaps identified in the updated CSM. Seven total samples were collected from Mill Creek, Colonels Creek (Upper and Lower), and Jumping Run Creek. Surface water was analyzed for dissolved metals, explosives, perchlorate, and Biotic Ligand Model parameters. Sediment was analyzed for metals, explosives, and simultaneously extracted metals (SEM)/acid volatile sulfide (AVS)

The worst-case scenario for groundwater was designated in Cedar Creek Watershed with the RDX source. The watershed was not sampled as it is now covered under the Installation Restoration Program with an ongoing Feasibility Study and Proposed Plan.

Due to a combination of higher detection limits associated with the analytical method (USEPA SW6020A versus 1669), low water hardness, and laboratory blank metals contamination, the majority of surface water metals results were non-detect at levels above screening values or qualified as non-detect. Therefore, the potential migration of metals MCOC via surface water within the Upper Colonels Creek, and Lower Colonels Creek (including Jumping Run Creek) should be recategorized as Inconclusive.

The surface water metals results that did not qualify as non-detect included lead detections that exceeded the reference level and the USEPA freshwater ecological screening value at two locations in Mill Creek; therefore, the Mill Creek watershed was determined to be Referred. Low-level detections of perchlorate in surface water were less than the reference level and screening value. There were no detections of explosives in surface water. Sediment results indicated there is no migration of metals from source areas at Fort Jackson/McCrady Training Center and no detections exceeded screening values. No explosives were detected in sediment.

Based on the Inconclusive results of the surface water samples for metals MCOC, this Advanced Assessment recommended the source area ranges, consisting of 53 firing ranges, 4 dudded impact areas, 14 non-dudded impact areas, 39 maneuver and training areas, and 16 historic impact areas, totaling 46,950.56 acres, should be re-categorized as Inconclusive.

The remaining ranges, including the entirety or portions of the 3 firing ranges, 1 non-dudded impact area, 2 historical impact areas, and 16 maneuver and training areas within the Mill Creek Watershed of Fort Jackson, encompassing 4,372.22 acres, be categorized as Referred due to the migration of lead MC off-range in surface water at concentrations exceeding the state standard and that potentially pose an unacceptable risk to off-range ecological receptors.

The Army and Fort Jackson/McCrady Training Center will determine appropriate further analysis to better characterize the risk posed by these ranges and monitor MC migration off-range.

All ranges at Fort Jackson and McCrady Training Center should be included in the Fiscal Year 2023-2027 cycle of ORAs.

Advanced Assessment Conclusions

ACRONYM LIST

AOI – Area(s) of Interest
APP – Accident Prevention Plan
CD – Cultural Debris
CEHNC – Corps of Engineers, Huntsville Center
DA – Department of the Army
DMM – Discarded Military Munitions
GIS – Geographical Information System
GPS – Global Positioning System
HE – High Explosive
IGE – Independent Government Estimate
MD – Munitions Debris
MEC – Munitions and Explosives of Concern
MIMID – Miniature Mine Detector
MPMG – Multi-Purpose Machine Gun
OE – Ordnance and Explosives
OESS – Ordnance and Explosives Safety Specialist
PDA – Personal Digital Assistant
ROM – Rough Order of Magnitude
RRD – Range Related Debris
RTLP – Range and Training Lands Program
UXO – Unexploded Ordnance

1.0 GENERAL DISCUSSIONS

1.1 INTRODUCTION

1.1.1 In an effort to support the Sustainable Range Program (SRP), the Ordnance and Explosives (OE) Directorate Corps of Engineers Huntsville Center (CEHNC) conducted a Munitions and Explosives of Concern (MEC) reconnaissance survey on the proposed Multi-Purpose Machine Gun (MPMG) Range at Camp McCrady, SC. The survey served to gather information that determines the location, extent and quantity of surface MEC and estimates the extent and quantity of subsurface MEC on the area of interest (AOI) for the planned RTLP project. This report will recommend response actions based on observations and data collected.

1.2 PROJECT OBJECTIVES

1.2.1 The objectives of the ordnance survey are as follows:

1) Gather sufficient data to adequately characterize the nature of MEC at the AOI designated by Camp McCrady;
2) Categorize AOI into a low, medium or high risk area(s) by determining the potential that individuals performing work on the site will encounter MEC;
3) Gather sufficient data in order to define clearance footprints;
4) Gather sufficient data to produce rough order of magnitude (ROM) estimate for MEC response action activities.

1.3 SCOPE OF MEC RECON SURVEY

1.3.1 CEHNC mobilized one 2-person team to traverse the AOI at the MPMG Range. The site was overlain with transects and uploaded to a Thales Mobile Mapper (TMM) personal digital assistant (PDA) with an integrated global positioning system (GPS) to guide the teams throughout the surveys. The transect path is designed to provide a uniform site coverage which will demonstrate meaningful site models. The uploaded transect paths were followed throughout the survey. The transect paths can be viewed in Appendix A maps.

1.3.2 During fieldwork, the team photographed significant munitions related items, terrain, vegetation, quality control functions and other pertinent visual opportunities that would aid in the understanding of the potential for explosive hazards at the site. All site photos can be viewed in Appendix B.

1.3.3 Historical documentation is sought for each site that is slated for a MEC recon survey. No site historical information was recovered. Appendix C has been left as a place holder in the event that historical information is revealed during the project.

1.3.4 Data quality is the most essential element of the MEC recon survey. A functionality test strip was swept twice daily to insure proper equipment function, battery strength, data quality and proper techniques are being applied by the operators. The test strip is established prior to

fieldwork. A MEC simulant was swept in the morning and at the end of the day. The QC log can be viewed in Appendix D.

1.3.5 The survey was an instrument assisted qualitative and quantitative reconnaissance that logged items encountered on the surface as well as quantities of detected subsurface anomalies. Items logged may include unexploded ordnance (UXO), munitions debris (MD), discarded military munitions (DMM), Range Related Debris (RRD), berms, craters, targets and any other notable ordnance related features. Complete definitions of munitions related terms can be found in Appendix E. The survey enables the CEHNC GIS team to generate quantitative and qualitative site models that display MEC related characteristics of the site, improves the accuracy of a MEC response action government estimate and provides data to MEC contractors for accurate response action proposals.

1.3.6 The actual field data collected is weighted heavily in the conclusions and recommendations of the MEC survey. Constant vigilance is imperative to collecting reliable data. The two primary factors that decrease the accuracy of MEC surveys are vegetation and speed of collection. No vegetation removal is executed prior to MEC surveys. Also, many miles of transect must be traversed to cover the large range areas in a small amount of time. A balance of walking pace and adequate detection sweeping must be negotiated by the detection equipment operator. 8.5 miles of transect was covered in order to attain the necessary site coverage. 253 data points were collected. The OESS, using an analog magnetometer, swept a one meter wide swath and reported the counts to the data collector every 50 meters. The surface count encompassed a three meter wide swath. All counts were inventoried every 50 meters. The data collector kept the team on the projected path and informed the OESS when the next point had been reached. The field team leader monitors detection quality being achieved. If quality issues are observed, the field team leader is responsible for correcting the problem. The collection data can be viewed in Appendix F.

1.4 TECHNICAL APPROACH

1.4.1 The CEHNC team developed a survey coverage strategy using Geographical Information System (GIS) files. The CEHNC team created an addendum to the programmatic work plan (PWP) to meet the data quality objectives of the project.

1.4.2 Camp McCrady provided GIS data and/or information necessary to locate and development a comprehensive plan that would guide the recon team throughout the survey. The CEHNC GIS team created an overlay of transects for the survey team to follow while in the field.

1.4.3 A test plot was implemented at the site. A simulant was utilized at the test plot to verify equipment function. Coordinates were taken of the item for documentation. The test plot is a quality control (QC) matrix utilized to demonstrate proper function of the detection equipment and competence of the detection equipment operators. A Schiebel Miniature Mine Detector (MIMID) Electromagnetic (EM) all metals detector was used for quantitative subsurface anomaly counts. Detection of the simulants was verified each day at the site before and after survey activities.

1.4.4 The CEHNC GIS technician uploaded data files to the TMM to provide guidance in the field. While in the field the GIS technician guided the team as close to the proposed transects as possible. The team logged all surface and subsurface contacts at the end of a 50 meter increment along the transect. Data collection points were established every 50 meters along the transect for the entire survey route.

1.4.5 One 2-man survey team followed the planned transects, logged observed surface UXO, DMM, MD, and CD, recorded physical features that would indicate MEC related activity, terrain, geology, targets and logged the number of subsurface ferrous anomalies detected. The team progressed along the projected transects with the OE safety specialist (OESS) in the lead. His primary mission was to cover a one meter wide strip with the MIMID and note the number of subsurface anomalies detected, count notable surface items and ensure any surface UXO on the path was avoided by the team. The TMM operator followed entering all ordnance related observations. The OESS covered a minimum one meter wide swath for subsurface contacts. An effective 3 meter wide swath was covered for visual identification of surface items. All munitions related items were logged at the data collection points.

1.5 SITE LOCATION

Camp McCrady is the National Guard contingent located on Fort Jackson, SC. The site is located at Range 24 on the west side of the East Impact Area.

1.6 SITE DESCRIPTION

The MPMG is approximately 166 acres in surface area. The terrain is flat to rolling with a few abrupt changes in elevations. The vegetation is primarily wooded with oaks. The soil is very sandy.

1.7 MEC RELATED SITE HISTORY

The site is within the current delineated impact area. An active range exists to the north which the footprint overlaps down range. Numerous ordnance appears to have been used on the current range. Historic range fans for 105mm and 155mm Howitzer are displayed in the 2005 historical review previously conducted by Malcolm Pirnie. The historical review can be view in Appendix C. The historical range fans were geo-referenced and overlaid with the range footprint. The overlaid footprint can be viewed in Appendix A Figure 7.

1.8 PERSONNEL

1.8.1 Project Manager

Ken Hewitt is the project manager and is responsible for execution of all aspects of the MEC survey.

1.8.2 Technical Manager

Jason Burcham is the technical manager and is responsible for all technical issues that affect project implementation, quality, and feasibility.

1.8.3 GIS Analyst Team

Dustin Ray is the GIS specialist and is responsible for project GIS deliverables.

1.8.4 OE Safety Specialist

Michael Slovak was the OESS during field work. He was responsible for the safety of the team in the field, identification of ordnance, the abbreviated accident prevention plan (APP), assist in quality control, operation of detection equipment, and reporting MEC related data to the data collector.

1.8.5 Field Team Leader

Jason Burcham was the field team leader. He was responsible for creation and adherence to the project work plan and work plan addendum, adequate collection of data at the sites, quality control, field coordination with range control, and development of the MEC survey report.

1.8.6 Camp McCrady POC

Major Moyer was the primary points of contact (POC) during the survey.

2.0 TECHNICAL DISCUSSION

2.1 INITIAL COORDINATION - The team arrived at Fort Jackson range control at 0700 on Sunday November 11, 2012. The survey team was given clearance to occupy then proceeded to the site. The team surveyed transects until coverage was complete. The project progressed as follows in Table 1.

2.2 FIELDWORK PROGRESSION - Fieldwork progressed very efficiently throughout the survey. The team completed the site within schedule and collected the data needed for analysis of the site. The time spent performing fieldwork on the site can be viewed in Table 1.

TABLE 1
Fieldwork Progression

Site	Date	Type of Investigation	Begin	End	Complete
MPMG	**11/11/12**	**Survey**	**0730**	**1730**	**No**
MPMG	**11/12/12**	**Survey**	**0730**	**1430**	**Yes**

2.3 TEST PLOT - An area offsite was swept by an OESS and determined free of subsurface anomalies. An ordnance simulant item was placed on the surface and swept in order to fulfill the QC matrix for equipment function and operator competence. The test plot was swept at the beginning and end of fieldwork each day. The coordinates of each offsite location are provided in Table 2. A Schiebel MIMID was tested at the beginning and end of field activities at the site. It underwent and passed all functionality checks. Detection was observed and noted. Detection devices were inspected for any damage that may impair its functionality.

TABLE 2
Simulant Locations

AOI	Simulant	Depth	Coordinates, WGS84 UTM Zone 17N (X,Y)
MPMG	MEC Simulant	0	513152, 3764582

2.4 FIELD ACTIVITIES
One 2-person team traversed the site on November 11-12, 2012. A test strip was created offsite for equipment functionality checks. After functionality checks were complete, the survey commenced. The team traversed separate transects delineated north-south across the site. The transects were spaced 100 meters apart across the 166 acre site. The effective coverage was 262 acres due to transects that exceeded the limits of the MPMG footprint. See Figure 2 of Appendix A for a graphic representation of site coverage. The MEC survey team proceeded with the OESS sweeping a one meter wide swath with a Schiebel MIMID on high setting. Metallic subsurface anomalies in the path were counted and logged at predetermined data collection points (Every 50m). The data collector guided the team between data points. The team counted surface items and the OESS identified munitions related items. UXO, MD, RRD and CD were logged during the survey. Old hard targets were observed on the site. High quantities of ordnance is present on the northern portion of the site (See Appendix A).

2.5 SUMMARY OF FINDINGS – 4093 MD items were observed which consisted of HE fragments, 81mm Illumination Mortars, 105mm TP Projectiles. Two MEC items were observed which consisted of a 75mm HE Projectile and a 90mm HEAT Projectile. Several targets exist as well as high quantities of small arms bullets/debris.

TABLE 3
Summary of Findings

Site	MEC Observed	RRD Observed	MD Observed	MEC Response Needed
MPMG	2	456	4093	Yes

3.0 MAP REFERENCES, ARCHIVAL REFERENCES AND DISCUSSIONS

3.1 Overall MPMG Location - The location is displayed in Figure 1, Appendix A, Overall Location Map. The site is located at Range 24 west of the impact area. Figure 1 provides a visual reference of the site in relation to the installation.

3.2 MPMG Recon Survey Coverage - The proposed coverage of the site is generated at the CEHNC prior to fieldwork. The coverage is an unbiased uniform coverage of the site. Actual survey coverage may vary in the field due to installation instructions, dangerous terrain features, and/or field revision based MEC encountered. Typically the survey coverage delineated in the office is followed in the field to the greatest extent practical. The proposed coverage thoroughly covered the boundaries of the MPMG Range. The MPMG Range Site coverage can be viewed in appendix A, Figure 2.

3.3 Subsurface Contact Distribution
Subsurface anomalies were observed at the site. A Schiebel MIMID EM analog metal detector was used to gather subsurface quantitative data. All metallic anomalies are detectable by the instrument. The subsurface contacts indicate subsurface metallic densities. Anomaly densities

were developed to demonstrate the subsurface metallic characteristics of the sites. The densities reported are typically lower than the anomaly densities that will be encountered during a removal action. The subsurface density contours can be viewed in Appendix A, figure, 3.

3.4 Surface Density
Metallic surface items were logged during the recon. The surface density map demonstrates quantitative metallic surface characteristics of the site. The densities reported are typically lower than the anomaly densities that will be encountered during a removal action. The surface density maps can be viewed in Appendix A, figure 4.

3.5 Munitions Item Map
A munitions related surface item map was created to demonstrate significant findings of the reconnaissance survey. The item map can be viewed in Appendix A, figure 5.

3.6 Risk of Encountering MEC - A map that demonstrates areas of high, medium, and/or low risk of encountering MEC has been created based on the data collected. The map does not denote the hazard severity of the items encountered, but the probability of encountering explosive hazards throughout the AOI based on all known information. The map can be viewed in Appendix A, Figure 6.

3.7 Historic Analysis – A historical analysis was completed from a 2005 historical review report produced by Malcolm Pirnie. The historic map pertaining to the project site was geo-referenced and overlain onto the MPMG footprint. The map can be viewed in Appendix A Figure 7. The historical report can be viewed in Appendix C. Figure 4-9 in the report was overlain onto the footprint.

3.8 Data Tables - The determinations made in this report rely heavily upon the field data collected while traversing the site. Constant vigilance and awareness of the munitions related site characteristics must be maintained at all times in order to collect reliable data. At each data point a thorough data collection checklist is evaluated to determine munitions related quantitative and qualitative characteristics of the segment that was traversed. Typical data collection point spacing is approximately 50 meters. This regimen of data collection was performed 253 times at the MPMG. The data collection tables can be viewed in Appendix F.

4.0 MEC SURVEY CONCLUSIONS

Two MEC items were discovered during the survey. Evidence of MEC related site use exists throughout a large portion of the site. Numerous HE fragments were observed. The site exhibits areas with low, medium and high probability of encountering explosive hazards. Figure 6, Appendix A conveys the risk of encountering MEC probability map.

5.0 MEC SURVEY RECOMMENDATIONS

A subsurface clearance is recommended in the medium and high risk areas. Standby construction support is recommended in the low risk areas.

This report accurately depicts the survey team's evaluation of the extent of UXO contamination at the site but likely underreports the nature of contamination. The actual conditions experienced during a removal action will differ significantly from the conditions reported herein for a number of reasons. For example, the site was not cleared of vegetation prior to the survey; therefore this hampered the survey efforts which most likely resulted in an under reporting of surface and sub-surface anomaly density. Also, the speed at which the surveyor moved across the site and the fact that no QA followed will inherently result in an underestimation of the anomalies to be encountered in an actual removal action. Also an anomaly as reported herein is an area which demonstrates elevated geophysical instrument response and not the number of metallic items to be encountered at the site. Given that removal teams often define an anomaly as a metallic item as opposed to an anomalous area it is certain that the anomaly density reported by removal teams will exceed the anomaly density reported herein. The type of geophysical instrument and settings used by removal teams will certainly differ from those used by the survey team thereby creating differences between reported and actual number of geophysical anomalies at the site. The survey transect spacing is relatively wide compared to the small size of the construction features (targets, road corridors, etc) and it is likely that the survey missed high anomaly density areas that may be part of the clearance area. These and other factors will cause the report to underestimate the conditions at the site. The use of the data provided as the basis of estimate requires an experienced understanding of how the data of this type is collected, analyzed, interpreted, and presented and requires an understanding of the limitations of the data provided by assessments of this type. Therefore this information shall not be used by bidders in preparation of their pricing proposals. Bidders who do utilize this information shall accept full and sole responsibility for identifying and considering all factors that may affect the cost to execute the work use the data presented herein at their own risk.

GLOSSARY OF TERMS

Closed Range – A military range that has been taken out of service as a range and that either has been put to new uses that are incompatible with range activities or is not considered by the military to be a potential range area. A closed range is still under the control of a Department of Defense (DoD) component.

Defense Site – All locations that are or were owned by, leased to, or otherwise possessed or used by the DoD. The term does not include any operational range, operating storage or manufacturing facility, or facility that is used or was permitted for the treatment or disposal of military munitions.

Discarded Military Munitions (DMM) – Military munitions that have been abandoned without proper disposal or removed from storage in a military magazine or other storage area for the purpose of disposal. The term does not include unexploded ordnance, military munitions that are being held for future use or planned disposal, or military munitions that have been properly disposed of consistent with applicable environmental laws and regulations.

Explosive Ordnance Disposal (EOD) – The detection, identification, on-site evaluation, rendering safe, recovery, and final disposal of unexploded explosive ordnance. It may also include explosive ordnance that has become hazardous by damage or deterioration.

Explosives Safety – A condition where operational capability and readiness, personnel, property, and the environment are protected from the unacceptable effects of an ammunition or explosives mishap.

Formerly Used Defense Site (FUDS) – A DoD program that focuses on compliance and cleanup efforts at sites that were formerly used by the DoD. A FUDS property is eligible for the Military Munitions Response Program if the release occurred prior to October 17, 1986;

the property was transferred from DoD control prior to October 17, 1986; and the property or project meets other FUDS eligibility criteria.

Military Munitions – All ammunition products and components produced for or used by the armed forces for national defense and security, including ammunition products or components under the control of the Department of Defense, the U.S. Coast Guard, the U.S. Department of Energy, and the National Guard. The term includes confined gaseous, liquid, and solid propellants, explosives, pyrotechnics, chemical and riot control agents, smokes, and incendiaries, including bulk explosives, and chemical warfare agents, chemical munitions, rockets, guided and ballistic missiles, bombs, warheads, mortar rounds, artillery ammunition, small arms ammunition, grenades, mines, torpedoes, depth charges, cluster munitions and dispensers, demolition charges, and devices and components of the above. The term does not include wholly inert items, improvised explosive devices, and nuclear weapons, nuclear devices, and nuclear components, other than non-nuclear components of nuclear devices that are managed under the nuclear weapons program of the Department of Energy after all required sanitization operations under the Atomic Energy Act of 1954 have been completed.

Munitions and Explosives of Concern (MEC) – This term, which distinguishes specific categories of military munitions that may pose unique explosives safety risks, means unexploded ordnance, DMM, or munitions constituents (e.g., Trinitrotoluene [TNT], Cyclotrimethylenetrinitramine [RDX]) present in high enough concentrations to pose an explosive hazard.

Munitions Constituents (MC) – Any materials originating from unexploded ordnance, DMM, or other military munitions, including explosive and non-explosive materials, and emission, degradation, or breakdown elements of such ordnance or munitions.

Operational Range – A range that is under the jurisdiction, custody, or control of the Secretary of Defense and that is used for range activities or, although not currently being used for range activities, that is still considered by the Secretary to be a range and has not been put to a new use that is incompatible with range activities.

Other than Operational Range – Encompasses closed, transferred, and transferring ranges.

Range – A designated land or water area set aside, managed, and used for range activities of the DoD. Ranges include firing lines and positions, maneuver areas, firing lanes, test pads, detonation pads, impact areas, electronic scoring sites, buffer zones with restricted access and exclusionary areas, and airspace areas designated for military use in accordance with regulations and procedures prescribed by the Administrator of the Federal Aviation Administration.

Transferred Range – A range that is no longer under military control and had been leased by the DoD, transferred, or returned from the DoD to another entity, including federal entities. This includes a military range that is no longer under military control, but that was used under the terms of an executive order, special-use permit or authorization, right-of-way, public land order, or other instrument issued by the federal land manager. Additionally, property that was previously used by the military as a range, but did not have a formal use agreement, also qualifies as a transferred range.

Transferring Range – A range that is proposed to be leased, transferred, or returned from the DoD to another entity, including federal entities. This includes a military range that was used under the terms of a withdrawal, executive order, special-use permit or authorization, right-of-way, public land order, or other instrument issued by the federal land manager or property owner. An active range will not be considered a transferring range until the transfer is imminent (generally defined as the transfer date is within 12 months and a receiving entity has been notified).

Unexploded Ordnance (UXO) – Military munitions that have been primed, fused, armed, or otherwise prepared for action; have been fired, dropped, launched, projected, or placed in such a manner as to constitute a hazard to operations, installations, personnel, or material; and remain unexploded either by malfunction, design, or any other cause.

1 INTRODUCTION

The Department of Defense (DoD) has established the Military Munitions Response Program (MMRP) under the Defense Environmental Restoration Program (DERP) to address DoD sites with unexploded ordnance (UXO), discarded military munitions (DMM), and munitions constituents (MC) located on current and former military installations. Properties classified as operational military ranges, permitted munitions disposal facilities or operating munitions storage facilities are not eligible for the MMRP, nor are sites that had releases after September 30, 2002. The United States (U.S.) Army's (Army) inventory of closed, transferring, and transferred (CTT) military ranges and defense with UXO, DMM, or MC has identified sites eligible for action under the MMRP. Ten closed ranges (also referred to as sites) were identified during the inventory at Fort Jackson, located in the City of Columbia, Richland County, South Carolina (SC). A Site Inspection (SI) is currently ongoing at these sites. This report presents the results of the SI Historical Records Review (HRR).

The DoD is currently establishing policy and guidance for munitions response actions under the MMRP. However, key program drivers developed to date conclude that munitions response actions will be conducted under the process outlined in the National Contingency Plan (40 Code of Federal Regulations 300) as authorized by the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, 42 United States Code (U.S.C.) 9605, as amended by the Superfund Amendments and Reauthorization Act of 1986 (SARA), Pub. L. 99-499 (hereinafter CERCLA). While it is the DoD's goal to address MMRP sites under the CERCLA, the Army recognizes that some installations (including Fort Jackson) will need to address these sites under the Resource Conservation and Recovery Act (RCRA) Corrective Action (CA) program.

The Final Phase 3 CTT Range Inventory Report (CTT Range Inventory) for Fort Jackson, dated June 2003, marked the completion of the Preliminary Assessment (PA) phase of work under CERCLA and the RCRA Facility Assessment (RFA) phase of work under the RCRA CA program. The next step in the process is the SI (CERCLA terminology), which

corresponds with the Confirmatory Sampling (CS)/RCRA Facility Investigation (RFI) Phase I under RCRA. The work at Fort Jackson will be implemented under the MMRP SI program, which utilizes CERCLA terminology for programmatic documents. As such, the documents developed for the Fort Jackson MMRP SI, including the HRR, will use CERCLA terminology. It is understood that the following RCRA CA program terminology is implied:

Table 1-1: CERCLA and RCRA Terminology

CERCLA	RCRA
Preliminary Assessment (PA)	RCRA Facility Assessment (RFA)
Site Inspection (SI)	Confirmatory Sampling (CS)/RCRA Facility Investigation (RFI) Phase I
Remedial Investigation (RI)	RFI

1.1 PURPOSE/SCOPE

The purpose of the Site Inspection HRR is to perform a limited-scope records search to document historical and other known information for MMRP sites at Fort Jackson, to supplement the CTT Range Inventory information, and to facilitate decisions on what information is needed to determine the next steps in the CERCLA/RCRA process. The SI is part of the CERCLA process and will be conducted following completion of the HRR report. As noted in the previous section, the SI corresponds with the CS/RFI Phase I.

1.2 PROJECT DRIVERS

The regulatory structure for managing MMRP sites at Fort Jackson is guided by a mixture of federal, state, and local laws, as well as DoD and Army regulations and guidance. The picture is further complicated by debates at the national level between the DoD and the United States Environmental Protection Agency over key issues that include uncertainty of the final structure of the MMRP. However, key legislative and administrative precedents to date will undoubtedly influence the final regulatory framework for the MMRP. The key legislative, administrative, and historic precedents include the following:

Defense Environmental Restoration Program (DERP) Management Guidance (September 2001)

The DERP Management Guidance establishes a MMRP element for UXO, DMM, and MC defense sites. The history of DERP dates back to the SARA of 1986. The scope of the DERP is defined in 10 U.S.C. §2701(b), which states that the:

> Goals of the program shall include the following: … (1) The identification, investigation, research and development, and cleanup of contamination from hazardous substances, pollutants, and contaminants. (2) Correction of other environmental damage (such as detection and disposal of unexploded ordnance) which creates an imminent and substantial endangerment to the public health or welfare or to the environment.

National Defense Authorization Act (Fiscal Year [FY] 02) (Sections 311-312)

Sections 311-312 of the National Defense Authorization Act of FY02 reinforced the DoD's 2001 DERP Management Guidance by tasking the DoD to develop and maintain an inventory of defense sites that are known or suspected to UXO, DMM, or MC. Section 311 requires the DoD to develop a protocol for prioritizing defense sites for response activities in consultation with the states and Tribes. Section 312 requires the DoD to create a separate program element to ensure that the DoD can identify and track munitions response funding.

The September 2001 Management Guidance for the DERP and the Defense Authorization Act FY02, described above, established the MMRP. The DERP and the MMRP provide guidance and methods for conducting a baseline inventory of defense sites containing, or potentially containing, UXO, DMM, or MC.

1.3 BACKGROUND

As stated above, the CTT Range Inventory for Fort Jackson is considered to mark the completion of the PA phase of work under the CERCLA. The SI is the next phase in the CERCLA process and will complete the PA/SI requirements for the MMRP sites. As noted in the beginning of this section, the HRR uses CERCLA terminology. It is understood that RCRA CA program terminology is implied. The following paragraphs summarize the results

of the CTT Range Inventory at Fort Jackson and present the primary goals of performing a SI.

1.3.1 Inventory

The Army Range Inventory program was conducted in three phases. The first phase (Phase 1) involved a data call issued through the Army Environmental Center (AEC) requesting general information about ranges on various installations under each U.S. Army Major Command. The Phase 1 Inventory was conducted using a questionnaire called the Advance Range Survey (ARS). The ARS allowed the Army to meet the short-term data goal of supporting the DoD preparation of Senate Report 106-50.

Mr. James Wyatt, Range Officer, completed the ARS Phase 1 Inventory survey for Fort Jackson in November 2000. Three records for CTT ranges at Fort Jackson were found in the database. The CTT ranges listed in the ARS included the Old Hand Grenade Range #3, Old Small Arms Range #3, and a World War II Rifle Range Complex #6, all of which were considered closed. The Fort Jackson ARS data was submitted to AEC and compiled into a master database of Army installations.

The ARS allowed the Army to meet its short-term needs; however, the Army's long-term needs required a more detailed inventory of its ranges that was not achievable based on the information in the ARS. For management and budgetary reasons, the Army divided the detailed follow-up inventory into two phases. The Phase 2 Inventory addressed operational ranges, while Phase 3 covered CTT ranges and sites with UXO, DMM, or MC. During the Fort Jackson Phase 2 Inventory, completed in the winter of 2000, 44,028 acres were classified as operational range areas. The results were documented in a range inventory binder that was submitted to Fort Jackson and its major command, the U.S. Army Training and Doctrine Command (TRADOC).

The Phase 3 Inventory was completed for Fort Jackson in June 2003. Ten closed ranges were identified at Fort Jackson. Additional information regarding the results of the Phase 3 CTT Range Inventory is discussed in Sections 2.2 and 3.3.

1.3.2 Site Inspection

The primary goal of the MMRP SI is to collect information necessary to make one or more of the following decisions: 1) determine whether a RI/Feasibility Study is required at a site; 2) determine whether an immediate response is needed; or 3) determine whether the site qualifies for no further action (NFA). The installation-wide SI at Fort Jackson will address both munitions and explosives of concern (MEC), which include UXO and DMM, and MC issues for the MMRP sites. The secondary goals of the SI are to include collecting data to prepare better Cost to Complete estimates and site prioritization for the MMRP sites.

1.4 REPORT ORGANIZATION

This HRR has the following sections:

- Section 1 – Introduction
- Section 2 – Site Description
- Section 3 – Data Collection and Document Review Process
- Section 4 – Summary of Findings
- Section 5 – Conceptual Site Model (CSM)
- Section 6 – Conclusions

The following supporting information and analyses are appended to this HRR:

- Archives Searched/Data Sources (Appendix A)
- Archive Documents (Appendix B)
- Interview Records (Appendix C)
- Munitions Technical Data Sheets (Appendix D)

2 SITE DESCRIPTION

2.1 INSTALLATION DESCRIPTION

Fort Jackson (also referred to as the "installation") is located in the eastern section of Columbia, SC, in Richland County near the center of the state. The inset on Map 2-1 shows the location of the installation within SC. The installation occupies approximately 52,000 acres, which includes a cantonment area, training and maneuver areas, live fire zones, and impact areas. The cantonment area, which contains the majority of the facility housing, administrative buildings, and industrial operations, is located in the southwestern portion of the installation. Recreational areas at Fort Jackson include the Fort Jackson Flight Club (FJFC) (a radio-controlled [R/C] airplane field) and the Weston Lake Recreation Area. The remainder of the installation, which is primarily undeveloped and consists of moderate to dense pine woodlands, is used for military training.

Fort Jackson was originally established in 1917 (referred to as Camp Jackson at that time) as an infantry training center. For a brief period of time (1921-1925), the installation was inactive. From 1925 to 1939, it was controlled by SC and used as an encampment and training area for National Guard troops. In 1939, the facility was transferred to the Federal Government, designated as Fort Jackson, and re-established as an infantry training center. The current and primary mission of Fort Jackson is to train initial entry recruits for duty as soldiers for Army units. To support this mission, Fort Jackson currently houses Army training brigades and serves as a reception station that processes newly inducted and prior service personnel forwarded to the installation from recruiting and induction stations.

2.2 MMRP SITE DESCRIPTIONS

Ten MMRP sites were identified at Fort Jackson during the CTT Range Inventory. These sites included the following:

- 1000-Yard Range
- 600-Yard Range

- Andrew Jackson Range
- FJFC
- Hand Grenade Court Number No. 2
- Live Hand Grenade Court 2
- Machine Gun Range
- Mortar Range
- Rifle Grenade Range Number NR 2
- Submachine Gun Area

The site locations are illustrated on Map 2-1, and the sites are discussed in detail in Section 3.3. The information obtained and descriptions of these sites that resulted from the CTT Range Inventory are presented in the following paragraphs:

1000-Yard Range: The 1000-Yard Range (Army Environmental Database-Restoration [AEDB-R] Site ID: FTJA-001-R-01) was a former rifle range located in the current cantonment area near Washington Road and Ivy Road (more accurately described as near Hartsville Guards Road and Chesnut Road). The approximately seven-acre range was listed on a 1919 map adjacent to the 600-Yard Range (also included in the CTT Range Inventory). The range was used from 1918 to 1920. Documentation indicated that the 1000-Yard Range included intermediate targets and was used as a 100-, 200-, 300-, 600-, and 1000-yard range. Today, the area is adjacent to base housing, streets, and a school. However, the area where the former 1000-Yard Range was located and the immediate area surrounding the range are undeveloped. During the CTT Range Inventory, the Range Control Officer and the data collection team visited the area where the ranges were located. Signs of a former rifle range were not observed. The team did not locate records of UXO sightings, incidents, or clearances related to the 1000-Yard Range.

600-Yard Range: The 600-Yard Range (AEDB-R Site ID: FTJA-002-R-01) was a former rifle range located directly adjacent to and south of the 1000-Yard Range in the cantonment area near Hartsville Guards Road and Chesnut Road. The 19-acre range was listed on a 1919 map. The range had a series of targets located at 100, 200, 300, 500 and 600 yards. The dates of use (1918 to 1920) of the 600-Yard Range are assumed to be identical to the dates for the 1000-Yard Range. Today, the area is adjacent to base housing, streets, and a school. However, the area where the former 600-Yard Range was located and the immediate area surrounding the range are undeveloped. During the CTT Range Inventory, the Range Control Officer and the data collection team visited the area surrounding the former rifle range and did not observe signs of the former rifle range. The team did not locate records of UXO sightings, incidents, or clearances related to the 600-Yard Range.

Andrew Jackson Range: The Andrew Jackson Range (AEDB-R Site ID: FTJA-003-R-01) is currently a morale, welfare, and recreation (MWR) area used for recreational small arms target practice. The range is open to the military, dependents, and civilian employees and is managed by the MWR program at Fort Jackson. The range is located just off of Wildcat Road within the current boundaries of the West Impact Area. The range area consists of approximately 15 acres. The recreational pistol range was established in the early to mid 1980s. The area was formerly part of the surface danger zone for the M-1 Transition Range NR 3, which was shown on several maps from the 1940s. The area was also in the buffer of several overlapping range fans (small arms ranges) from the 1950s. For the CTT Range Inventory, the area was identified as a closed range because it was not operational and had a former range use.

FJFC: The FJFC (AEDB-R Site ID: FTJA-004-R-01) was an approximately 54-acre area located east of Wildcat Road just north of Shenandoah Road. The area was used as a machine gun range in the 1950s, 1960s, and 1970s. The FJFC land consists of a flat, cleared, level area surrounded by forest and grassland. The flat, cleared portion of the site has been used as an airstrip for R/C small recreational type model aircraft since the late 1980s. The improvements to the site for the airstrip include a gravel parking area, sun shade, a picnic area, a grounds maintenance storage building, and a set of bleachers for spectators to watch

the R/C model plane operations. The area was considered a closed range for the purposes of the inventory because it was not operational and had a former range use.

Hand Grenade Court No. 2: The Hand Grenade Court No. 2 (AEDB-R Site ID: FTJA-005-R-01) was located in the northern part of the Weston Lake Area southwest of the Mortar Range. The period of use (1944 to 1950) and types of grenades reported for the inventory are approximate. Using a conservative approach, it was assumed for the CTT Range Inventory that live, as well as practice, grenades may have been used on the range. It is important to note that the team did not locate records of UXO sightings, incidents, or clearances related to the Hand Grenade Court No. 2. The three-acre area shown on Map 2-1 is a 100-meter by 100-meter square representing the approximate size and location of the former hand grenade impact area. The range is closed. It lies within the boundary of the Weston Lake Area. The area adjacent to Weston Lake is used for camping, picnics, and other recreational activities. However, the former hand grenade court has not been improved with recreational facilities (e.g., camp sites, trails, etc.) and is in a remote location not easily accessible by people using the Weston Lake Area recreational facilities.

Live Hand Grenade Court 2: The Live Hand Grenade Court 2 (AEDB-R Site ID: FTJA-006-R-01) was listed on a 1949 map of Fort Jackson. The approximate period of use for this range was 1940 to 1950. The period of use and types of grenades reported for the inventory were approximated based upon maps reviewed and the history of the installation. It was assumed that live, as well as practice, grenades may have been used on the range. The team did not locate records of UXO sightings, incidents, or clearances related to the former Live Hand Grenade Court 2. The range is closed. The three-acre area shown on the Map 2-1 is a 100-meter by 100-meter square representing the approximate size and location of the former hand grenade impact area. The area is close to the Pierce Terrace base housing complex, which is located just off of Chesnut Road. The immediate area of the former hand grenade range is undeveloped. This area was also used for field fortification training in the 1970s and 1980s.

Machine Gun Range: The Machine Gun Range (AEDB-R Site ID: FTJA-007-R-01) was in the current cantonment area near Hartsville Guards Road and Chesnut Road. The former three-acre range was just south of the 1000-Yard Range and the 600-Yard Range. It is also assumed that this range was used only between 1918 and 1920. Today, the area is adjacent to base housing, streets, and a school. However, the area where the former machine gun range was located and the immediate area surrounding the range are undeveloped. The Range Control Officer and the data collection team visited the area surrounding the former range and did not observe signs of the former range.

Mortar Range: The Mortar Range (AEDB-R Site ID: FTJA-008-R-01) was located in the northern section of the Weston Lake Area, with the Hand Grenade Court Number No. 2 to the southwest and the Submachine Gun Area to the east. The approximately 112-acre area was once part of a buffer for a mortar range in the 1940s. In addition, in 1969, other ranges overlapped the area, including 105-millimeter (mm), 155-mm, and 8-inch Howitzer ranges. The Submachine Gun Area also overlapped the area. The range is closed and is now part of the Weston Lake Area. However, the Mortar Range area has not been improved by recreational facilities (e.g., camp sites, trails, etc.) and is located about 1/4 mile north of the main recreation facilities at the Weston Lake Area. The team did not locate records of UXO sightings, incidents, or clearances related to the Mortar Range.

Rifle Grenade Range NR 2: The Rifle Grenade Range NR 2 (AEDB-R Site ID: FTJA-009-R-01) was estimated to be used from the 1940s through the 1960s. The range was used for firing rifle grenades and was also listed on a 1993 map reviewed at the installation with the hand written title "Explosive Ordnance Impact Areas". The map depicted several different explosive ordnance impact areas on Fort Jackson that were drawn in by hand. The range is closed and is now part of the Weston Lake Area. The 90-acre area has not been improved with recreational facilities (e.g., camp sites, trails, etc.) and is located approximately 1/2 mile west of the main recreation facilities of the Weston Lake Area. A dirt road runs close to the site (Washington Light Infantry Road), which is accessible by vehicle from the installation, but not from the Weston Lake Area. There is the potential that practice and live high explosive (HE) rifle grenades were fired on the former Rifle Grenade

Range NR 2. In 1969, the area appeared to be in the buffer areas for 155-mm and 8-inch Howitzer ranges. The impact area associated with the artillery ranges was not located in close proximity to the 90-acre Rifle Grenade Range NR 2 area.

Submachine Gun Area: The Submachine Gun Area (AEDB-R Site ID: FTJA-010-R-01) was located in the northern part of the Weston Lake Area extending into the East Impact Area. The area reported in the inventory occupied 101 acres and consisted of three separate ranges listed on a 1949 map of Fort Jackson. The three ranges included the Dismounted Submachine Gun No. 1 Range, the Moving Vehicle Submachine Gun Range, and the Dismounted Submachine Gun No. 2 Range. All three ranges were adjacent to each other, and their range fans overlapped. The ranges were situated so that the direction of fire was to the north into the East Impact Area. The Submachine Gun Area is closed and is now part of the Weston Lake Area. However, the range area has not been improved by recreational facilities (e.g., camp sites, trails, etc.) and is located approximately 1/4 mile north of the main recreation facilities at the Weston Lake Area. The team did not locate records of UXO sightings, incidents, or clearances related to the range.

3 DATA COLLECTION AND DOCUMENT REVIEW PROCESS

Five primary sources of information were researched as part of the data collection effort for the HRR. The types of data included:

1) National and regional archives record group (RG) search
2) Installation site visits
3) Review of existing Archives Search Reports (ASRs) and administrative records for adjacent Formerly Used Defense Sites (FUDS) associated with Fort Jackson
4) Interviews
5) Review of the CTT Range Inventory and backup data

3.1 DATA COLLECTION METHODS

3.1.1 National and Regional Archives

Relevant archival record repositories and RGs were selected based on guidance set forth in the *Technical/Regulatory Guideline for Munitions Response Historical Records Review,* prepared by the Interstate Technology & Regulatory Council Unexploded Ordnance Team and based on the process developed by the U.S. Army Corps of Engineers (USACE) for performing ASRs (guidance provided at http://www.mvs.usace.army.mil/engr/ed-p/asr.htm). Only the record repositories that have historically proved to be most useful were searched. The archival repositories and RGs that were searched for this HRR are listed below. The archival data reviewed are presented by RG and source in Appendix A.

- National Archives, National Archives & Records Administration (NARA), College Park, Maryland (MD)
    - RG 18: Army Air Forces
    - RG 51: Bureau of Budget
    - RG 71: Bureau of Yards and Docks
    - RG 77: Chief of Engineers

  - RG 92: Quartermaster General
  - RG 111: Office of the Chief Signal Officer
  - RG 114: Natural Resources Conservation Service
  - RG 145: Agricultural Stabilization and Conservation Service
  - RG 156: Office of Chief of Ordnance
  - RG 168: National Guard Bureau
  - RG 270: War Assets Administration (WAA), Real Property Disposal Files
  - RG 319: Army Staff
  - RG 337: Headquarters, Army Ground Forces
  - RG 338: U.S. Army Commands
  - RG 373: Defense Intelligence Agency
  - RG 393: U.S. Army Continental Commands, 1821-1920
  - RG 394: U.S. Army Continental Commands, 1920-1942
  - RG 407: Adjutant General

- Library of Congress Prints & Photographs Division

- Library of Congress Geography and Map Division

- Library of Congress Main Reading Room

- Library of Congress Manuscript Division

- Regional Archives, NARA Southeast Region, East Point (Atlanta), Georgia

  - RG 77: Chief of Engineers
  - RG 156: Office of Chief of Ordnance
  - RG 270: WAA, Real Property Disposal Files

3.1.2 Web Search

In addition to the data sources listed above, Malcolm Pirnie also conducted research on the Internet to supplement the archival data and information received from the installation. The

list below presents the web sites that were searched for information on Fort Jackson. The search was conducted on June 28, 2004 and June 30, 2004. Information collected from the web search is presented in Section 3.2.

- Department of Defense Archives, http://www.defenselink.mil/pubs/archive.html
- DoD Explosives Safety Board, http://www.ddesb.pentagon.mil/

3.1.3 Site Visit

An initial site visit to Fort Jackson was conducted on May 4 and 5, 2004, by Malcolm Pirnie team members Ms. Susan Burtnett, Ms. Leigh Blake, and Mr. Jonathan Sperka. Ms. Burtnett, Ms. Blake, and Mr. Dan Hains conducted a follow-up site visit on June 16 through 18, 2004. Additional data was reviewed during a third site visit conducted by Ms. Burtnett and Ms. Blake on July 7 and 8, 2004. The site visits were conducted to review relevant installation records to complete the HRR and to develop the CSMs for the Fort Jackson sites. While on-site, Ms. Burtnett and Ms. Blake reviewed environmental reports and documents for Fort Jackson at the Environmental/Natural Resources Office, Fort Jackson Museum, and Range Control. Interviews with relevant personnel were also conducted. A summary of the applicable information collected during the site visit is presented in Sections 3.2.1 through 3.2.4. Results of the interviews are presented in Section 3.2.5.

3.1.4 Existing ASR and FUDS Information Review

Malcolm Pirnie obtained a copy of the *Archives Search Report, Findings for the Former Pontiac Precision Bombing Range. May 1995. U.S. Army Corps of Engineers, Rock Island District and U.S. Army Defense Ammunition Center and School* and other FUDS related documents for the Pontiac Precision Bombing Range (I04SC003701) from the PIRS website referenced in Section 3.1.2. Malcolm Pirnie also obtained a copy of the *Archives Search Report, Findings for Columbia Army Air Base and Associated Sites. June 1994. U.S. Army Corps of Engineers, Huntsville District* and other FUDS related documents for the Columbia Army Air Base (I04SC044503) and Lake Murray Bombing Ranges (I04SC004001) from the PIRS website. Although the documents were prepared for the FUDS properties located outside of Fort Jackson, the documents were reviewed for information relating to Fort Jackson training activities. These documents provided no relevant information on munitions use at Fort Jackson.

3.2 ARCHIVAL/HISTORICAL AND OTHER RECORDS COLLECTED

The following subsections present the data collected from the various sources outlined in Section 3.1. Although additional records may have been reviewed from the sources presented above, the records listed in this section represent the data that was determined to be applicable to the development of the HRR and CSMs for Fort Jackson.

3.2.1 Documents/Reports

The following table is a list of documents that provided relevant information for the former range and training areas within Fort Jackson.

Table 3-1: Summary of Documents and Relevant Information.

Document Name	General History	General Installation Information	Munitions Use	MC
Confirmatory Sampling Report for Solid Waste Management Units 5, 11, 18, 19, 24, 27, 29, 31, 32, 33, 34, 35, 38, 39, 40 and Area of Concern C, Ft. Jackson, South Carolina. Ecology and Environment, Inc. July 1997.	X	X

- ATA-1MM-193, December 1970
- ATA-1MM-198, December 1970

3.2.5 Interviews

The following interviews were conducted to collect information for the HRR. Interview records from these interviews are included in Appendix C.

Fort Jackson Environmental Department – The data collection team interviewed Mr. Lahiri Estaba, the Installation Restoration Program (IRP) Manager, on June 16, 2004, while at the installation for the site visit. Mr. Estaba is an on-site contractor and has worked at Fort Jackson for over nine years. Mr. Estaba is responsible for the installation's RCRA permit and Solid Waste Management Units (SWMUs) that are undergoing corrective action. He was familiar with the locations of the IRP sites and their soil and groundwater data, and provided information regarding those sites in relation to nearby MMRP sites. This information has been incorporated into site descriptions in this report. Information is also shown on Map 3-1, included at the end of Section 3. The IRP sites that were discussed included SWMU 1, SWMU 17, SWMU 21, and SWMU 34. In addition, the installation has completed surface and near-surface soil background studies. Mr. Estaba provided the data collection team with copies of these reports.

The data collection team also interviewed Mr. James McCracken, the installation's National Environmental Policy Act Coordinator, on June 18, 2004, while at the installation for the

site visit. Mr. McCracken has been at the installation for more than 15 years and provided historical information regarding the MMRP sites. Additional range uses in the cantonment area were discussed, including the numerous small arms ranges used over the years. He noted that the FJFC was also used as a 40-mm practice grenade range. Mr. McCracken was also familiar with the hand and rifle grenade range use near the Weston Lake Recreation Area. Mr. McCracken provided a copy of an historical installation map showing the cantonment area (Cantonment Area, Ft. Jackson, SC, Sheet 1 of 3, September 1945 Army Map, SVC War Department).

Fort Jackson Range Control – The data collection team interviewed Mr. Wyatt, the Range Officer, on June 18 and July 8, 2004, while at the installation for the site visit. Mr. Wyatt provided maps and documents regarding the MMRP ranges. The team discussed the historical range uses and range locations in the cantonment area. Mr. Wyatt noted that the area where the Live Hand Grenade Court 2 was depicted on maps had been extensively disturbed during the 1970s and 1980s when the area was used for field fortification training. Mr. Wyatt also discussed the hand grenade and rifle grenade ranges near Weston Lake. He agreed that the locations of the sites vary on different installation maps and that it appeared both hand grenade and rifle grenade use may have occurred at the Hand Grenade Court No. 2 and the Rifle Grenade Range NR 2. Mr. Wyatt provided copies of relevant documents, maps, and range fans sketches for the team's use.

The data collection team interviewed Staff Sergeant (SSG) Mark Wood on June 17, 2004, while at the installation for the site visit. SSG Wood escorted Malcolm Pirnie personnel to the FJFC Range and the Hand Grenade Court No. 2 and Rifle Grenade Range NR 2 Ranges located in the Weston Lake Area. SSG Wood provided a general description of the current uses in the vicinity of the closed ranges. SSG Wood could not provide much historical information on the ranges because he had only been stationed at Fort Jackson for three years.

Fort Jackson Forestry Office – The data collection team interviewed Mr. John Maitland, the Lead Forester, on June 16, 2004, while at the installation for the site visit. Mr. Maitland was familiar with the ranges, especially the Hand Grenade Court No. 2 and Rifle Grenade NR 2 Range near the Weston Lake Area. He noted that there were inconsistencies in how these ranges were shown on installation maps over the years. Mr. Maitland is responsible for managing the forestry resources at the installation. As such, he has been at the sites for logging purposes. Recently, longleaf pines have been planted adjacent to the FJFC. Logging has taken place at the rifle and hand grenade ranges near Weston Lake. Mr. Maitland noted that these areas have been surface cleared. He also provided aerial photographs of the installation for review. Relevant sections of the aerials were copied while at the installation, and they served as a primary source of site-specific information for the HRR.

Fort Jackson Engineering Office - The data collection team interviewed Mr. James Murphy, Engineering Technician, on July 28, 2004 via telephone. Mr. Murphy was contacted about the June 1, 1957 Basic Information for Master Plan, Range and Training Areas Map that he provided to us during the CTT Range Inventory data collection. The map legend was faded in several areas, and information was needed for the HRR. Mr. Murphy referred the team to the Fort Jackson Museum for a copy of the map.

Fort Jackson Museum – The data collection team interviewed Ms. Bessie Williams and Mr. Fred DeMag. Both were helpful in identifying historical maps showing the ranges.

Fort Jackson Real Property Office - The data collection team interviewed Mr. Thomas Peel, the Real Property Officer, on July 28, 2004 via telephone about real property records for range use and closure dates. Mr. Peel stated that the team would need to speak to Mr. Wyatt of Range Control for information. He stated that he does not receive information on range use, but noted that there have been no property boundary changes associated within the team's areas of interest.

Fort Jackson Wildlife Office - The data collection team interviewed Mr. Mark Dutton, the Natural Resource Specialist, on June 16, 2004, while at the installation for the site visit. Mr. Dutton provided maps showing cultural resource sites near the MMRP ranges. Other than a cemetery located north of the Hand Grenade Court No. 2 and Rifle Grenade Range NR 2 near Weston Lake, no cultural resources were identified in the other than operational areas.

3.3 PHASE 3 ARMY RANGE INVENTORY RESULTS

The purpose of the *Closed, Transferring, and Transferred Range/Site Inventory Report for Fort Jackson, South Carolina,* Malcolm Pirnie, June 2003, was to identify CTT ranges that are not within the operational training areas at Fort Jackson. The specific requirements of this investigation included: mapping CTT ranges and sites with UXO, DMM, or MC; collecting and preparing the data for inclusion in the Army Range Inventory Database; conducting an assessment of explosive safety risk using the Risk Assessment Code (RAC) on each CTT range or site; and determining which sites potentially qualify for the MMRP.

The CTT Range Inventory identified ten closed ranges totaling 407 acres within the installation's boundaries. The ranges and associate acreage are identified as follows: 1000-Yard Range (seven acres), 600-Yard Range (19 acres), Andrew Jackson Range (15 acres), FJFC (54 acres), Hand Grenade Court No. 2 (three acres), Live Hand Grenade Court 2 (three acres), Machine Gun Range (three acres), Mortar Range (112 acres), Rifle Grenade Range NR 2 (90 acres), and Submachine Gun Area (101 acres). The inventory summaries for these ranges are presented in Section 2.2.

The RAC process required the completion of a worksheet that consisted of a series of questions regarding each CTT range or site. Based on the results of the worksheet, a relative score (RAC score) for each area was assigned. The RAC score is an estimate of the relative explosives safety risk, which was reported as a number from one (high explosives safety risk) to five (negligible explosives safety risk). The RAC scores for the ranges/sites evaluated during the CTT Range Inventory are summarized in Table 3-2. The RAC scores

were developed based on the findings during the CTT Range Inventory and do not reflect new or additional information regarding these ranges/sites obtained during the HRR.

Table 3-2: CTT Range Inventory Range/Site RAC Scores

Range/Site Name	Munitions Type	RAC Score
1000-Yard Range	Small arms	5
600-Yard Range	Small arms	5
Andrew Jackson Range	Small arms	5
FJFC	Small arms	5
Hand Grenade Court No. 2	MEC	2
Live Hand Grenade Court 2	MEC	3
Machine Gun Range	Small arms	5
Mortar Range	MEC	2
Rifle Grenade Range NR 2	MEC	2
Submachine Gun Area	Small arms	5

3.4 SUMMARY OF OTHER PREVIOUS INVESTIGATIONS

Based on the data repositories reviewed for the HRR, the following previous investigations were identified which contained information pertaining to munitions use and/or relevant environmental data at Fort Jackson.

Confirmatory Sampling Report for Solid Waste Management Units 5, 11, 18, 19, 24, 27, 29, 31, 32, 33, 34, 35, 38, 39, 40 and Area of Concern C, Ft. Jackson, South Carolina - July 1997

This report describes CS investigations performed at 14 SWMUs and one area of concern. The report was written to meet the requirements of Fort Jackson's RCRA permit issued in October 1991. The report provides an historical overview of Fort Jackson and describes its environmental setting. The majority of the SWMUs evaluated in this report are in the

cantonment area, including SWMU 34, which is located near MMRP sites/ranges in the cantonment area.

SWMU 34 is the former location of a 30-foot by 30-foot concrete wash pad and a 400-gallon capacity oil/water separator that received vehicle wash water containing oil and grease. This unit is located on the eastern side of the cantonment area north of Semmes Road and approximately 250 feet northwest of the sanitary landfill. This area is in close proximity to the Transition Range located in the cantonment area, which is discussed in Sections 4 and 5 of this HRR. No significant contamination was found at SWMU 34. Some metals were present at concentrations that slightly exceeded the maximum background levels measured at Fort Jackson.

Supplemental Confirmatory Sampling Report for Solid Waste Management Units 5, 11, 29, 33, 34, 38 and Area of Concern C - April 2001

The results of this supplemental investigation combined with the results of the previous CS efforts performed in July 1997 (discussed above) were used to decide if further actions were needed at any of these sites. With respect to SWMU 34, the supplemental CS was conducted to determine if contamination was present in this area that was associated with high Organic Vapor Analyzer readings recorded during the 1995 CS investigation. This supplementary CS recommended NFA at SWMU 34. This report also provided limited historical information on Fort Jackson.

Soil Background Study Report for the Fort Jackson Military Installation Columbia, South Carolina - January 2001

This report presents the procedures, methodologies, and data from the Background Soil Study for the Fort Jackson Military Installation. The objective of this study was to develop comprehensive data sets characterizing levels of metals in the soil at Fort Jackson. The report concluded the following:

1. Sample depth (at least within a range significant for risk analysis) does not appear to be a meaningful discriminator of background soil concentrations.

2. Sample location (undeveloped versus developed) and soil type, or some combinations thereof, do appear to be discriminators for background soil concentrations.
3. Three sets of background soils are needed for Fort Jackson: sandy soils of developed areas, sandy soils of the undeveloped areas, and clayey soils combining both areas.

This report also provided a brief background and history of Fort Jackson, as well as an environmental sampling history.

Integrated Cultural Resources Management Plan (ICRMP*)* - June 2000, Revised April 2002

This report was written to meet the legal compliance requirements of federal historic preservation laws and regulations. The ICRMP establishes priorities for the identification of and standards for the evaluation of historic properties on Fort Jackson and provides a schedule designed to accomplish program objectives during a five–year period. The vast majority of land on Fort Jackson has been inventoried for cultural resources and historic properties. The ICRMP reported that a total of 662 archaeological sites have been identified at Fort Jackson to date. With the exception of 11 cemeteries recorded as archaeological sites, these resources require no further management consideration. Twelve sites are considered eligible for the National Registry of Historic Places (NRHP). Ninety-six sites have been recommended as potentially eligible for the NRHP. These resources must be preserved in place until their exact NRHP status is determined. There are no eligible or potentially eligible NRHP sites located on the sites being evaluated as part of the MMRP.

The ICRMP reported that one federally listed animal species exists on Fort Jackson: the Red-cockaded Woodpecker. The bird nests in aging pines, lives in family groups and inhabits park-like territories or clusters of 1,500-foot radii. There are 13 active clusters and 39 inactive clusters on the Fort Jackson installation. This population is routinely monitored, and the surrounding forest is managed to encourage survival of the groups. One cluster is located within close proximity to the Weston Lake Area, including the Rifle Grenade Range NR 2.

Revised Final Phase II RFI Report for Wonsan (SWMU 12) and Inchon (SWMU 17) Explosive Ordnance Disposal Sites - March 2003

The purpose of this report was to present the additional information collected during the 1999 and 2000 Phase II RFI activities, incorporate the new data, and perform an updated human health and ecological risk assessment of the two EOD sites, Wonsan (SWMU 12) and Inchon (SWMU 17). The Submachine Gun Range and the Mortar Range, which are being evaluated in the MMRP, are located in the Weston Lake Area. SWMU 17 is located approximately one and one-half miles east of Weston Lake. This report was helpful in providing general information about the Weston Lake Area. This document also reported that two federal and/or state listed threatened and endangered species are present at Fort Jackson: the Rough-leaved Loosestrife and the Red-cockaded Woodpecker.

Final U.S. Army Closed, Transferring and Transferred Range/Site Inventory for Fort Jackson, SC - June 2003

The objective of this report was to present the CTT Range Inventory for Fort Jackson. In preparation of this report, historical research was conducted to identify CTT ranges and sites subject to the inventory and their locations, periods of use, and associated types of UXO, DMM, or MC. This report contains a historical background of Fort Jackson and installation summary and is discussed further in Section 3.3.

RCRA Facility Investigation SWMU 1 Phase II RFI Report - March 2004

SWMU 1, also known as the former Sanitary Landfill No. 3, is closed and is located north of Semmes Road and east of Chesnut Road within the cantonment area. SWMU 1 is also located within the Transition Range's safety/buffer area. Phase II sampling for SWMU 1 was completed in 2003; data sets collected during the Phase I and Phase II efforts were combined to complete the RFI. This document reported that ten compounds (chromium, dieldrin, acetone, methylene choride, benzo(a)anthracene, 2,4-Dinitrotoluene, n-nitroso-di-n-propylene, 4-Chloro-3-methylphenol, 4-Nitrophenol, and pentachlorophenol) were present in soil samples at concentrations that exceeded their respective site-specific screening levels. However, these chemicals were considered not to represent a significant threat to shallow

groundwater. Therefore, further investigation to evaluate the potential for migration to groundwater was not recommended.

2004-2008 Integrated Natural Resources Management Plan (INRMP) and Environmental Assessment – April 2004

The purpose of the INRMP is to guide the implementation of the natural resources program for Fort Jackson from 2004 to 2008. The program is designed to conserve Fort Jackson's land and natural resources and helps to ensure compliance with environmental laws and regulations. The INRMP helps to endure the maintenance of quality training lands to accomplish Fort Jackson's critical military mission on a sustained basis and to ensure that natural resources conservation measures and Army military mission activities are integrated and consistent with federal stewardship requirements. The INRMP provided thorough descriptions with respect to Fort Jackson's historical background, cultural resources, physical environmental setting, biological resources, and natural resources. The INRMP is referenced throughout this HRR.

Fort Jackson Range Architectural Inventory Construction Engineering Research Laboratory, April 2004

This document is an Historic American Buildings Level IV Survey prepared to determine eligibility for inclusion on the NRHP for the following buildings and landscapes: 41 ranges, three bivouac regions, and 29 buildings in the Fort Jackson cantonment area and two structures neither on the ranges nor in the cantonment area. This report concluded that none of the ranges, buildings, or landscape elements evaluated in this report at Fort Jackson are eligible for the NRHP under any of the National Register Criterions. Other than the Andrew Jackson Range, none of the MMRP sites were discussed in this report. However, the report did include maps showing ranges and range fans for the installation for 1946 and 1949. These maps were utilized as source data for the HRR.

The Cold War in South Carolina, 1945-1991 – An Inventory of Department of Defense Cold War Era Cultural and Historical Resources in the State of South Carolina – Second Interim Report U.S. Army Environmental Legacy Program

This report provided a detailed chronological historical background of events and activities conducted at Fort Jackson from 1917 through 1992. Pertinent information from this report has been incorporated into the HRR.

4 SUMMARY OF FINDINGS

4.1 IN DEPTH CHRONOLOGICAL HISTORY OF INSTALLATION

The installation dates back to 1917 when it was first opened as Camp Jackson. Camp Jackson was originally constructed on a 1,200-acre tract of land donated to the Federal Government by the citizens of the City of Columbia. In addition to the 1,200 acres donated by the City of Columbia, the Army purchased additional land bringing the total area of Camp Jackson to 22,000 acres. By 1918, approximately 45,000 military personnel were actively training at the installation, which was named in honor of Major General Andrew Jackson (seventh President of the U.S.). Camp Jackson remained active until July 27, 1921, when it was abandoned.

A wrecking company was called in to dismantle the camp after it was abandoned. The wrecking company was still at work tearing out sewer and water lines when, in 1925, the War Department decided to use the post again as a training camp for the SC National Guard. From 1925 to 1939, the facility was controlled by the state and was used as an encampment area for National Guard troops.

In 1939, the demands of war brought the area again under federal control. The facility was designated as Fort Jackson and was organized as an infantry training center. In 1940, the installation was enlarged, by land purchase, to 52,000 acres. During that time, four firing ranges and more than 100 miles of road were constructed. In 1946, Fort Jackson became an Army replacement training center when Camp McClellan was closed. During the 1950s, Fort Jackson served as an active duty headquarters for Alabama and Mississippi National Guard units and was occupied by various infantry divisions.

In 1968, the installation area was annexed into the City of Columbia. It was re-designated as an Army training center in 1973. The current and primary mission of Fort Jackson is to train initial entry recruits for duty as soldiers for Army units. Throughout the years, the

installation has grown to its current size of 52,000 acres. A chronological list of significant historical events is provided in Table 4-1.

Table 4-1: Timeline of Significant Events

Time Period	Significant Events
1900-1920	• 1917: Installation first opened as Camp Jackson. • 1918: Approximately 45,000 military personnel were training at the installation.
1920-1940	• 1921: Camp Jackson was abandoned. • 1925 - 1939: Installation was controlled by the state and used as an encampment for National Guard troops. • 1939: Installation was designated as Fort Jackson and was organized as the infantry training center.
1940-1950	• 1946: Fort Jackson became an Army replacement training center.
1950-1960	• 1950s: Fort Jackson served as an active duty headquarters for Alabama and Mississippi National Guard units.
1960-present	• 1968: Installation area was annexed into the City of Columbia. • 1973: Fort Jackson was re-designated as an Army training center.

4.2 MMRP SITE FINDINGS

Information not previously identified regarding the cantonment area, FJFC, and the Weston Lake Area sites was obtained through the research performed for this HRR. This information resulted in modifications to the original MMRP site descriptions and boundaries formulated during the CTT Range Inventory, which are presented in Section 2.2. The locations of the cantonment area, FJFC, and Weston Lake Area are shown on Map 4-1.

Based on the information obtained during the HRR, additional MMRP sites were identified within the cantonment area. These sites, as well as the sites identified during the CTT Range Inventory, are discussed in Section 4.2.1. Additional munitions types, including MEC, were identified for the FJFC. The westernmost portion of the FJFC was determined to have had no historical range use, thereby reducing the total acreage for the FJFC. Details regarding these findings are included in Section 4.2.2. Additional munitions types and acreage changes were identified for the Weston Lake Area sites. This information is provided in Section 4.2.3.

The CTT Range Inventory listed the Andrew Jackson Range as one of the ten MMRP sites. The Andrew Jackson Range was originally a military small arms range that had been closed. The site has been turned over to the Fort Jackson MWR Department for operation as a recreational small arms shooting range. Because of its current activity and the ongoing releases that have occurred there after September 30, 2002, it was determined that this site is not eligible for evaluation as part of the Fort Jackson SI.

4.2.1 Cantonment Area Ranges/Sites

The cantonment area, which is located in the western portion of Fort Jackson, contains three MMRP sites. Four ranges (i.e., the 1000-Yard, 600-Yard, Machine Gun, and Live Hand Grenade Court No. 2 ranges) were discussed in the CTT Range Inventory. Thirteen additional sites were identified during the preparation of the HRR. Due to a change of the operational range boundary, seven of these sites were determined to not be eligible for evaluation as part of the Fort Jackson SI. Map 4-2 shows the cantonment area range details.

For the purposes of this report, the cantonment area MMRP sites have been combined into the following range groups: Camp Jackson Ranges, Small Arms Ranges East of Chesnut Road, and Live Hand Grenade Court 2. The findings and modifications with respect to each site identified in the CTT Range Inventory, as well as the additional sites identified in the HRR, are presented in the following subsections. Map 4-3, included at the end of Section 4, shows the differences in the CTT Range Inventory and HRR range locations. Map 4-4, also included at the end of Section 4, highlights the cantonment area MMRP sites.

4.2.1.1 Camp Jackson Ranges

The Camp Jackson Ranges occupy 81 acres and include the following five small arms ranges: 1000-Yard Range, 600-Yard Range, 300-Yard Range, Machine Gun Range, and Pistol Range. The 1000-Yard, 600-Yard, and Machine Gun Ranges were identified in the CTT Range Inventory, whereas the 300-Yard and Pistol Range were identified in the HRR.

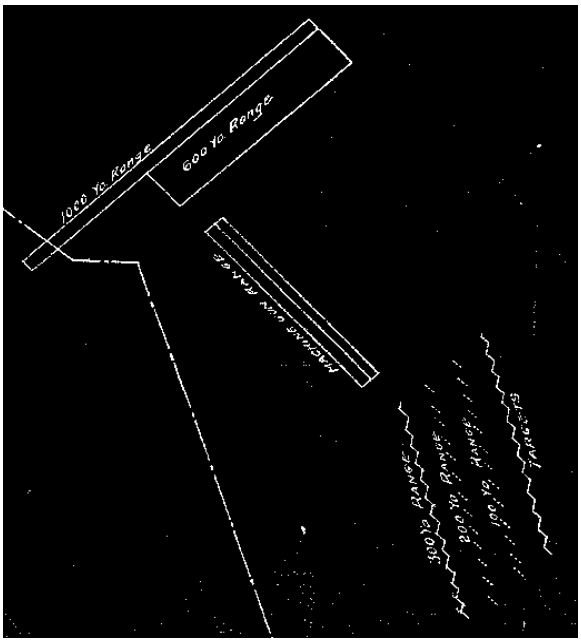

Figure 4-1: 1918 Location Map

The CTT Range Inventory reported that Camp Jackson had five rifle ranges in 1918, including 100-, 200-, 300-, 600-, and 1000-yard ranges. Based on information obtained during the CTT Range Inventory, these five ranges appeared to be located in a single range complex, with the 600-Yard and 1000-Yard Ranges located adjacent to each other and the 100-, 200-, and 300-yard ranges co-located within the 600-Yard Range boundary. During the HRR, a 1918 map (Figure 4-1) was obtained from the National Archives that showed the 300-Yard Range south of the 1000-Yard and 600-Yard Ranges. The 300-Yard Range included the 100- and 200-yard ranges. The 1918 map also depicts the Machine Gun Range. The Pistol Range is shown on a 1920 map. The Camp Jackson Ranges were used from 1918 through 1920 for small arms training.

1000-Yard Range

The 1000-Yard Range is described in the CTT Range Inventory as a former rifle range located near Washington Road and Ivy Road. During the research for this HRR, information was obtained that more accurately described the location and layout of the 1000-Yard Range. Based on review of historical maps, the 1000-Yard Range was located in the eastern portion of the cantonment area, just east of Chesnut Road and south of Hartsville Guards Road. This location is north of the 600-Yard Range and the Machine Gun Range, as identified in the CTT Range Inventory.

Historical correspondence indicated that construction of the 1000-Yard Range began in 1917, with the first operational use in early 1918. According to July 23, 1918 correspondence, the 1000-Yard Range had six targets located at 800 and 1000 yards. Based on historical documentation (i.e., letters, memorandums, and maps) the direction of fire was from west to east. Maps for Fort Jackson from 1918 (Figure 4-1) and 1919 depict the outline and configuration of the 1000-Yard Range. The 1920 Special Military Map depicts multiple gun emplacements, one of which is located in the general area of the 1000-Yard Range. Three ground targets and what appear to be two berms are also located in this area. Based on the range features shown on the 1920 map, the location of the 1000-Yard Range appears to be slightly north of where the CTT Range Inventory identified this range. Map 4-3 shows the CTT Range Inventory location of this range, as well as the revised location as determined by this HRR. The December 1926 Jackson National Forest Map does not depict the 1000-Yard Range. Based on the history of Fort Jackson, world events (e.g., end of World War I), and the documents and maps reviewed, it appears the range was used between 1918 and 1920.

600-Yard Range

The 600-Yard Range is described in the CTT Range Inventory as a former rifle range. As with the 1000-Yard Range, information was obtained during the HRR that more accurately described the location and layout of the 600-Yard Range. The range is located east of Chesnut Road and south of Hartsville Guards Road in the eastern portion of the cantonment

area. This location is south of the 1000-Yard Range and north of the Machine Gun Range, as identified in the CTT Range Inventory.

Historical correspondence indicates construction of the 600-Yard Range began in 1917, with the first operational use in early 1918. According to July 23, 1918 correspondence, the 600-Yard Range had a series of 200 targets located at 100, 200, and 300 yards (listed as short range targets) and 34 targets located at 500 and 600 yards (listed as mid range targets). The direction of fire was from west to east. Maps for Fort Jackson from 1918 (Figure 4-1) and 1919 depict the outline and configuration of the 600-Yard Range. The 1920 Special Military Map shows gun emplacements located in the general area of the 600-Yard Range. Three ground targets and what appear to be two berms located in the direction of fire are visible. Based on the locations of the gun emplacements, targets, and berms, the location of the 600-Yard Range appears to be slightly north of where the CTT Range Inventory identified this range.

Map 4-3 shows the CTT Range Inventory location of this range, as well as the revised location as determined by this HRR. The December 1926 Jackson National Forest Map does not depict the 600-Yard Range. Based on the history of Fort Jackson, world events (e.g., end of World War I), and the documents and maps reviewed, the range was used between 1918 and 1920.

300-Yard Range

The 300-Yard Range was a rifle range located south of the Machine Gun Range and north of the Live Hand Grenade Court 2. The 300-Yard Range included 100-, 200-, and 300-yard ranges. The 300-Yard Range is first shown on the June 1918 map and then again on the 1920 Special Military Map. The December 1926 Jackson National Forest Map is the last map to depict the 300-Yard Range.

A Completion Report of Camp Jackson, dated January 17, 1918, noted that the 300-Yard Range was located east of the cantonment area on a strip of land 13,200 feet wide and

42,000 feet long. A portion of this land, which was part of the 22,000 acres comprising Camp Jackson, was used for small arms training. The land configuration at the 300-Yard Range would not permit shooting directly from the firing trench to the target trench without danger of the bullets passing over the property line. Therefore, trenches were constructed in echelon (see Figure 4-1) to take advantage of the ridges/hills that were not parallel to the property line. This allowed for an easterly firing direction. The 50th Anniversary History 1917-1967 for Fort Jackson, prepared by the U.S. Army Training Center, includes a picture of the 300-Yard Range taken between 1917 and 1918. The picture shows the echelon configuration of the range, with target trenches and berms in the background (Figure 4-2).

Figure 4-2: 300-Yard Range

An October 11, 1917 Army memorandum written by the Adjutant General indicated that the 300-Yard Range was used for pistol firing. Camp Jackson's daily bulletins dated May 10 and 22, 1920 also indicated that there was pistol firing, confirming pistol use at the 300-Yard Range. An aerial photograph from 1959 (Figure 4-3) shows the remains of the 300-Yard Range echelon target area. Based on historical documents and correspondence, the 300-Yard Range was used from 1918 through 1920 by the Army and from 1920 through at least 1926 by SC National Guard troops.

Figure 4-3: 1959 Aerial Photograph

Machine Gun Range

The Machine Gun Range is described as a 1000-inch range. During the research for this HRR, information was obtained that more accurately described the location of the Machine Gun Range as east of Chesnut Road and south of Hampton Parkway in the eastern portion of the cantonment area. This location is south of the 1000- and 600-Yard Ranges, as identified in the CTT Range Inventory.

The Machine Gun Range is shown on the 1918 Location Map (Figure 4-1), the June 1918 map, the March 1919 General Map, and the 1920 Special Military Map. Historical correspondence indicates the construction of the Machine Gun Range began in 1917, with the first operational use in early 1918. According to July 23, 1918 correspondence, the Machine Gun Range had a series of 72 targets located on carriages that would be drawn on tracks toward the machine gun firing line during training exercises. The 50th Anniversary History 1917-1967 for Fort Jackson includes a picture of the Machine Gun Range taken between 1917 and 1918 (Figure 4-4). The direction of fire, as confirmed by historical documentation (i.e., letter, memorandums, and maps), was from west to east. The Machine Gun Range is not depicted on the December 1926 Jackson National Forest Map. Based on the history of Fort Jackson, world events (e.g., end of World War I), and the documents and maps reviewed, the range was used between 1918 and 1920.

Figure 4-4: Machine Gun Range

According to the *AR 750-10 Range Regulations for Firing Ammunition in Time of Peace,* typically light and/or heavy machine guns may have been used on 1000-inch rolling target machine gun ranges. The firing line was positioned 1000 inches in front of the targets. Probable ammunition used at the machine gun range includes 0.30-caliber, M1/5, (500-yard maximum range); 0.30-caliber, M2/3, (450-yard maximum range); and 0.50-caliber (7,500-yard maximum range).

Pistol Range

Evidence of this range was found on the 1920 Special Military Map. Gun emplacements (i.e., the firing point) were shown west of the Machine Gun Range. A backstop berm, which appears to be adjacent to a target area, is located north of the Machine Gun Range. Based on the configuration shown on the 1920 map, the direction of fire was northeast across the northernmost portion of the Machine Gun Range. A portion of the 1920 Special Military Map depicting the Pistol Range is shown in Figure 4-5. Because the range is only depicted on the 1920 map, it was likely constructed and used between 1919 and 1920.

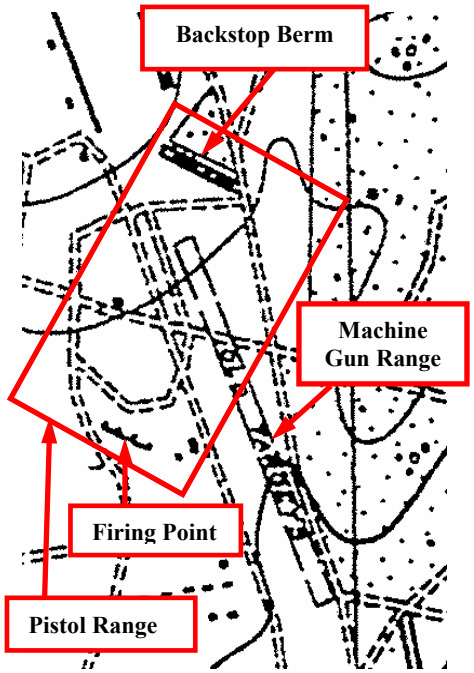

Figure 4-5: 1920 Special Military Map

Table 4-2, on the following page, summarizes historical use and overlapping range information for the Camp Jackson Ranges.

Table 4-2: Camp Jackson Ranges Historical Use Summary

Pistol Range			X		Small arms	Machine Gun Range, Transition Range, Pistol Range NR 2

4.2.1.2 Small Arms Ranges East of Chesnut Road

The Small Arms East of Chesnut Road include the following four ranges: Transition Range; 1000-Inch Range Nos. 14, 15, 16; Pistol Range NR 2; and the Landscape Target Range. These ranges, which comprise 546 acres, were discovered as a result of the research performed for this HRR. These ranges were generally used during time period of 1946 to 1970 and are discussed below.

Transition Range

The Transition Range was located east of Chesnut Road, north of Semmes Road, and south of Red Diamond and Hartsville Guards Roads. The firing direction was from west to east. The Transition Range and its associated range fan overlapped the majority of the CTT-identified cantonment area ranges (i.e., the 1000-Yard Range, 600-Yard Range, Machine Gun Range, and Live Hand Grenade Court 2). Additionally, the Transition Range and its associated range fan overlapped portions of the following HRR-identified ranges: the 300-Yard Range; Pistol Range; Pistol Range NR 2; 1000-Inch Range Nos. 14, 15, 16; and the Landscape Target Range.

Correspondence regarding range construction, dated April 25, 1947, indicates that the Transition Range originally was to consist of 11 lanes with the firing line located on the western portion of the range. This correspondence also states that range construction was to be completed by June 23, 1947. Range Regulations, dated May 24, 1949, indicate that there were 15 firing lines at that time. Targets were located at the following distances: six lanes had targets at 200, 300, and 500 yards; four lanes targets at 250, 300, 350, 400, 450, and 500 yards; one lane had targets at 100 yards; and four lanes had targets from five to 70 yards. The type of weapon fired at this range was identified in the Range Regulations as the M1 .30 Caliber Rifle.

The Transition Range, which is shown on both the 1946 and 1949 maps, was extended south to encompass the Live Hand Grenade Court 2 sometime between 1946 and 1949 (this coincides with the increase in firing lanes from 11 to 15 described in the historical correspondence). The 1946 map shows the Live Hand Grenade Court 2 located just south of the southwestern corner of the Transition Range, where as the 1949 map (Figure 4-6) shows the Live Hand Grenade Court 2 located within the southwestern corner of the Transition Range. A 1952 Location Map shows the Transition Range firing line (identified on the map as M-1 Trans #1 Range), but does not include the range fan. The 1955 Training Facilities Map and the 1956 Training Facilities Map NR 2 also shows the Transition Range.

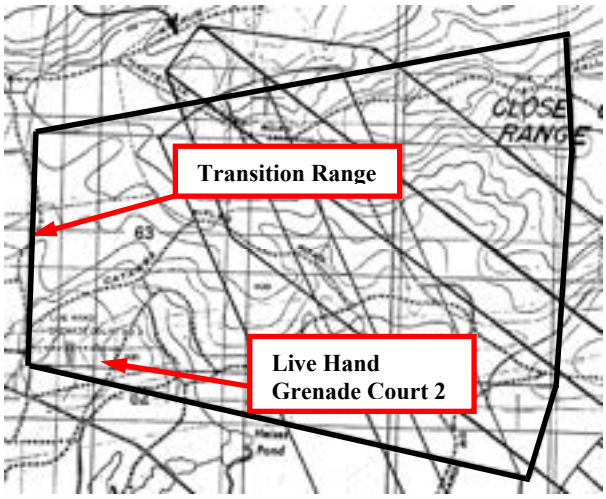

Figure 4-6: 1949 Fort Jackson and Vicinity Map

A Fort Jackson Basic Information Range Training Area Map, dated June 1, 1957, does not show the Transition Range. However, this map does show a Platoon Tactical Training Area (identified on the map as No. 309), Night Compass Course (No. 306), and Flame Thrower Area (No. 305) located just east of Chesnut Road where the westernmost portion of the

Transition Range was located. These three areas are only identified on the 1957 map (see Figure 4-7). Based on the historical correspondence and maps reviewed for the HRR, the period of use for the Transition Range was from 1947 to 1956.

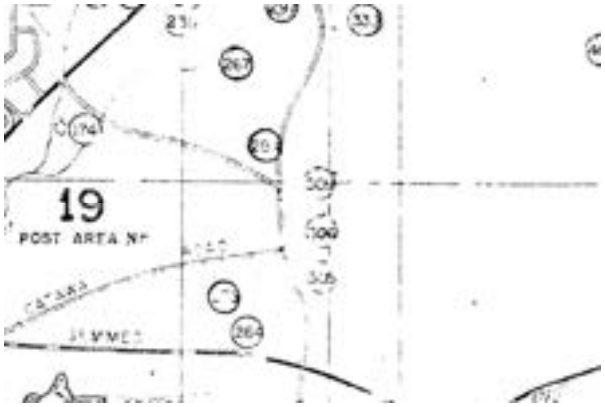

Figure 4-7: 1957 Basic Information Map

The *AR 750-10, Range Regulations for Firing Ammunition in Time of Peace* and *TM 9-855, Targets, Target Material, and Training Course Lay-outs* describe four general types of transition ranges used during the 1940s and 1950s. The first type of transition range was set up with firing lanes that had a single firing point and pop-up targets set at 200, 300, and 500 yards; each firing lane was approximately 60 yards wide. The second type of transition range was set up with firing lanes that had a single firing point and six stationary targets placed at random distances ranging from 200 to 500 yards; each firing lane was approximately 50 yards wide. The third type of transition range was set up without a limit of advance. This type of range consisted of up to ten firing lanes (each approximately 20 yards wide) that offered unique firing positions (i.e., fox holes, logs, etc.) and personnel transitioned along the firing line shooting from the various positions. Targets were placed at random distances out to 500 yards. The fourth type of transition range was set up with a limit of advance (typically no farther than 90 yards down range). This range utilized firing lanes in which personnel transitioned down-range while engaging pop-up targets positioned at various locations. Each lane was approximately 25 yards wide with earthen berms constructed between the firing lanes. Based on the historical documents reviewed, it appears that the Transition Range included a combination of these types of transition ranges.

1000-Inch Range Nos. 14, 15, 16

The 1000-Inch Range Nos. 14, 15, 16 is shown on the 1949, 1955, and 1956 maps. The 1949 map shows the 1000-Inch Range Nos. 14, 15, 16 located southeast of Golden Arrow Road and along the northeast side of Hartsville Guards Road, except for a small portion on the southwest side of Hartsville Guards Road. The firing point is located northeast of Hartsville Guards Road, with the direction of fire to the southeast. With the exception of a small area near the southern portion of the firing line, this range is overlapped by the Transition Range. When comparing the 1949 and 1956 maps, it was noted that the location of this range was shifted slightly to the south in the 1956 map. Map 4-2 illustrates the portion of this range that lies within the cantonment area.

Pistol Range NR 2

The Pistol Range NR 2 is shown on the 1952, 1955, and 1956 maps. This range is located east of Chesnut Road within the area identified as the Transition Range on the 1949 map. An aerial photograph from 1959 (Figure 4-8) shows the Pistol Range NR 2. Five berms that run in an east/west direction are visible in the photograph. These berms divided the range into separate firing areas. The firing points were located on the west side of the range with a target area located on the east side. A backstop berm located east of the firing lanes is also visible in the photograph. The Transition Range located north of the Pistol Range NR 2 is also visible in this aerial photograph.

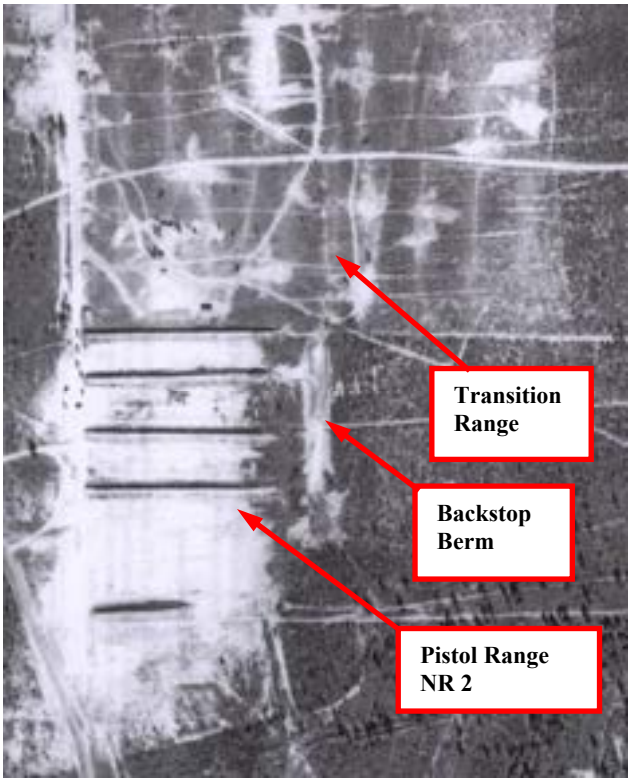

Figure 4-8: 1959 Aerial Photograph

Landscape Target Range

The Landscape Target Range is shown on the 1946 and 1949 maps. The maps show this range located south of Hartsville Guards Road, with a portion of the fan extending north across Hartsville Guards Road (Figure 4-9). The firing line was located southeast of the cantonment area, with the direction of fire to the northwest. The range fan extended northwest into the cantonment area. The Transition Range and 1000-Inch Range Nos. 14, 15, 16 overlap the portion of the Landscape Target Range that is located within the other than operational area.

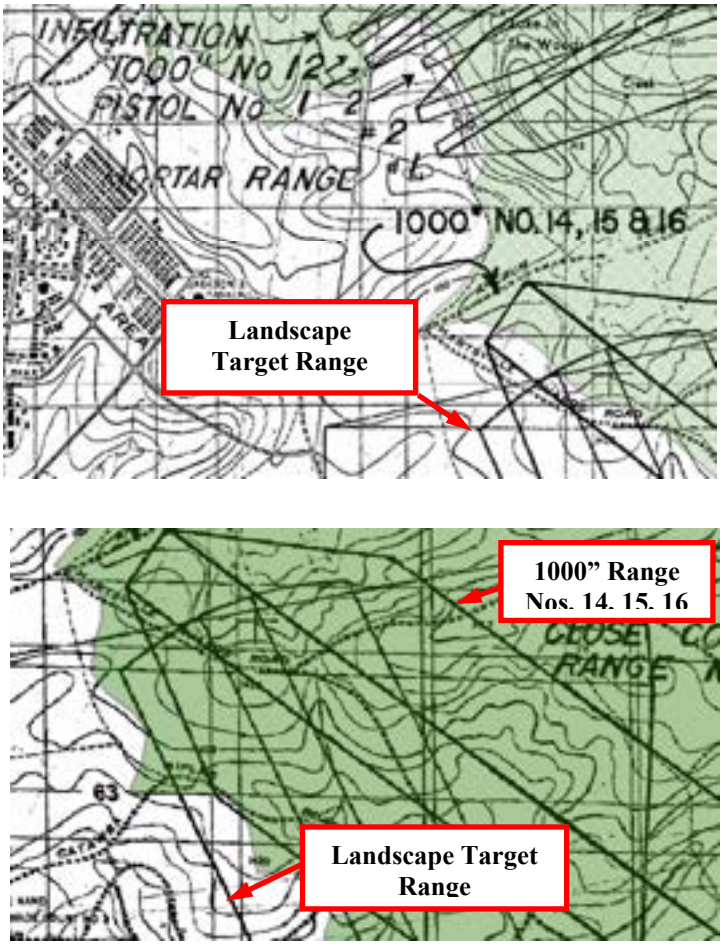

Figure 4-9: 1949 Fort Jackson and Vicinity Map with CTT Operational Boundary and Revised Operational Boundary

Based on information provided in the *AR 750-10, Range Regulations for Firing Ammunition in Time of Peace* and *TM 9-855, Targets, Target Material, and Training Course Lay-outs*, landscape targets were used for rifle practice on this type of 1000-inch range. The target set consisted of five black and white paper landscape targets that together made a panoramic picture of a landscape. The size of the panoramic picture was such that the features were recognizable at a distance of 1000 inches. Typically, .22 caliber weapons were fired at a Landscape Range and .30 caliber weapons were fired at a 1000-inch range.

Table 4-3 on the following page summarizes the historical use and overlapping range information for the Small Arms Ranges East of Chesnut Road.

Table 4-3: Small Arms Ranges East of Chesnut Road Historical Use Summary

4.2.1.3 Live Hand Grenade Court 2

The three-acre Live Hand Grenade Court 2 is described in the CTT Range Inventory as a former hand grenade training range. The Live Hand Grenade Court 2 is located east of Chesnut Road and north of Semmes Road in the eastern portion of the cantonment area. This range is located southwest of the Machine Gun Range as identified in the CTT Range Inventory. According to the CTT Range Inventory, the approximate period of use of the Live Hand Grenade Court 2 was from 1940 to 1950. Practice, as well as live, grenades may have been used on the range. The Live Hand Grenade Court 2 was first depicted on the Annex No. 1 Firing Ranges Map dated 1946 and last depicted on the Fort Jackson and Vicinity Map dated 1949 (see Figure 4-6). During the 1970s and 1980s, the area where the Live Hand Grenade Court 2 was located was used for field fortification training.

Based on descriptions included in the *AR 750-10, Range Regulations for Firing Ammunition in Time of Peace* and *TM 9-855, Targets, Target Material, and Training Course Lay-outs*, a typical live hand grenade court used during the 1940s consisted of a trench with targets and an impact area approximately 25 yards to the front of the throwing line. Targets consisted of a circular outline, a crater, and/or a foxhole. A danger area of approximately 600 feet would have been established around the entire range. The 1949 map shows several parallel lines running north to south that may indicate throwing lines and trenches. Based on the orientation of these lines, grenades were most likely thrown to the east and/or west.

Table 4-4 summarizes historical use and overlapping range information for the Live Hand Grenade Court 2.

Table 4-4: Live Hand Grenade Court 2 Historical Use Summary

Live Hand Grenade Court 2	X	X				Practice/live grenade training	300-Yard Range, Transition Range, Pistol Range NR 2

4.2.1.4 Ranges North of Hampton Parkway

The Ranges North of Hampton Parkway (which are northeast of Golden Arrow Road) include the following seven ranges: 1000-Inch Range No. 11, 1000-Inch Range No. 12, Pistol Range No. 1, Pistol Range No. 2, Mortar Range NR 1, Mortar Range NR 2, and the Infiltration Course. Several of these ranges can be seen in Figure 4-9. According to the operational range boundary used for the CTT Range Inventory, small portions of these ranges are located within the other than operational range area. These ranges, which comprise 32 acres, were identified as a result of the research performed for this HRR. These ranges were generally used during the time period of 1946 to 1957. During review of the draft HRR, additional mapping sources were identified that more accurately identified the operational range boundary. Based on this revised boundary, the Ranges North of Hampton Parkway are located within the operational range area and are not eligible for evaluation as part of the Fort Jackson SI. Details regarding these ranges are provided in the following paragraphs for informational purposes only.

1000-Inch No. 11

This small arms range was shown on the 1949, 1952, 1955, and 1956 maps. The 1000-Inch No. 11 Range is shown within the operational area on the 1949 map; however, the remainder of the maps show small portions of this range (near the firing points) located within the other than operational area. The direction of fire for this range was to the northeast.

1000-Inch No. 12

Small portions of this small arms range (near the firing points) were shown to be located within the other than operational area on the following maps: 1949, 1952, 1955, and 1956. The direction of fire was to the northeast.

Pistol Range No. 1

Small portions of this small arms range (near the firing points) were shown to be located within the other than operational area on the following maps: 1949, 1955, 1957, and 1969.

It is noted that this range was not shown on the 1956 map. The direction of fire was to the northeast.

Pistol Range No. 2

Small portions of this small arms range (near the firing points) were shown to be located within the other than operational area on the 1949 map. The 1946 map shows a range similar in size and location to the Pistol Range No. 2; however, it is only labeled as "Pistol". The direction of fire for the Pistol Range No. 2 was to the northeast.

Mortar Range NR 1

This range was shown on the 1949, 1952, 1955, and 1956 maps. Small portions of the Mortar Range NR 1 (near the firing line) are shown within the other than operational area on the 1949, 1955, and 1956 maps. Information on the Mortar Range NR 1, including firing line location and type of munition fired (i.e., 4.2-inch mortar), were described the April 15, 1950 Range Regulations. The range regulations indicate that the 4.2-inch mortar had a maximum range of 1,800 yards. The direction of fire for the Mortar Range NR 1 was to the northeast.

Mortar Range NR 2

Small portions of this range (near the firing line) were shown to be located within the other than operational area on the following maps: 1949, 1955, and 1956. The Mortar Range NR 2 was located south of, and overlapped portions of, Mortar Range NR 1. The direction of fire for this range was also to the northeast.

Infiltration Course

This range is shown on the following maps: 1949, 1952, 1955, 1956, 1957, and 1969. The entire Infiltration Course is shown within the operational area on the 1949 map; however, the remainder of the maps show small portions of the range (mainly near the firing points and the area of the range where the course would have been set up) located within the other than operational area. The direction of fire for the range was to the northeast. The 1957 map also

lists an Infiltration Course No. 2, with a location immediately south of the Infiltration Course. Since the 1957 map is the only reference for the Infiltration Course No. 2 and it is located immediately south of the Infiltration Course, this range is grouped together with the Infiltration Course.

According to the *AR 750-10, Range Regulations for Firing Ammunition in Time of Peace* and TM *9-855, Targets, Target Material, and Training Course Lay-outs*, an infiltration course was set up in a level area with logs and small mounds of dirt for personnel to roll over. The ground would have contained shell holes, trenches, slit trenches, wire entanglements, stumps, sparse brush, and other obstacles. Machine guns were typically fired from fixed platforms at the front of the range and reduced charges of explosives were placed in craters throughout the course to create realistic conditions during training.

Table 4-5 summarizes the historical use and overlapping range information for the Ranges North of Hampton Parkway.

Table 4-5: Ranges North of Hampton Parkway Historical Use Summary

Table 4-6 provides a summary of the historical time-line analysis for the ranges located in the cantonment area based on the maps reviewed.

Table 4-6: Cantonment Area Map Summary

Date of Map	Map Title	Map Observations
1918-1926	1918 Location Map 1918 Key Map of Property 1919 General Map 1920 Special Military Map 1926 National Forest Map	The ranges observed during this time frame include the following: 1000-, 600-, and 300-Yard Ranges, Machine Gun Range, and the Pistol Range. The 1000- and 600-Yard Ranges are only shown on the 1918 and 1919 maps. The Pistol Range is only shown on the 1920 map.
1946-1957	1946 Annex No. 1 Map 1949 Fort Jackson and Vicinity Map 1952 Location Map 1955 Training Facilities Map 1956 Training Facilities Map NR 2 1957 Master Plan Map	The ranges observed during this time frame include the following: Live Hand Grenade Court 2, Transition Range, 1000-Inch Range Nos. 14, 15, 16, and the Ranges North Hampton Parkway. The 1946 and 1949 maps depict the Live Hand Grenade Court 2 and the Transition Range. The Transition Range was extended to the south to encompass the Live Hand Grenade Court 2 between 1946 and 1949. The Ranges North of Hampton Parkway include the following: 1000-Inch No. 11 and 12 Ranges, Infiltration Course, Pistol Ranges No. 1 and 2, and the Mortar Ranges NR 1 and NR 2.
1969	1969 Master Plan	This map shows three range fans overlapping the other than operational area: the Pistol No. 1 Range, the South Carolina Range, and an unlabeled/unidentified range fan. In each case, only small portions of each range fan overlap the other than operational area, and these areas are included in other ranges/range fans previously identified in the maps reviewed above.

4.2.2 Fort Jackson Flight Club

The FJFC is a 54-acre area located east of Wildcat Road just north of Shenandoah Road. The western portion of the FJFC has been improved for recreational R/C model airplane use. Data obtained during the CTT Range Inventory indicated that the FJFC area was used as a machine gun range from 1955 to 1979. Information not previously identified regarding the FJFC area was obtained through the research performed for this HRR. Based on the data reviewed, the area on the western-most portion of the FJFC did not have a historical range use. As such, the MMRP sites do not include this area. The FJFC MMRP sites include the FJFC Salerno Ranges (15 acres) and the FJFC Small Arms Ranges (27 acres). Map 4-5 and Map 4-6 at the end of this section show the revised HRR site boundary, as well as the various ranges/range fans that overlap the FJFC. Map 4-7 shows the FJFC MMRP sites.

Since no evidence of range activity is indicated on the 1946 Annex No. 1 Firing Ranges Map, it was assumed that range activities were initiated at the FJFC area in the time period between 1946 and 1949. The 1949 Fort Jackson and Vicinity Map depicts two ranges that overlap the FJFC. The Field Firing Machine Gun range and safety fan are oriented to the southeast and cover the majority of the northern and eastern portions of the FJFC. The safety fan for the Close Combat No. 2 range extends into the southeastern corner of the FJFC, as shown on Figure 4-10. The machine gun range is labeled on the 1952 Fort Jackson Location Map as MG Field Firing #1 (Figure 4-11) and is in the same general location as shown on the 1949 map.

Figure 4-10: 1949 Fort Jackson and Vicinity Map with FJFC Overlay

Figure 4-11: 1952 Fort Jackson Location Map with FJFC Overlay

Based on the maps reviewed, the machine gun range usage continued through 1955 and 1956. However, the range fan is significantly larger as depicted on the 1955 and 1956 Training Facilities Maps when compared with that on the 1949 and 1952 maps. The 1955 and 1956 (Figure 4-12) maps both show the presence of an unlabeled smaller range located within the Machine Gun Field Firing Range NR 1. The range fan shape indicates that it may have also been used as a machine gun range.

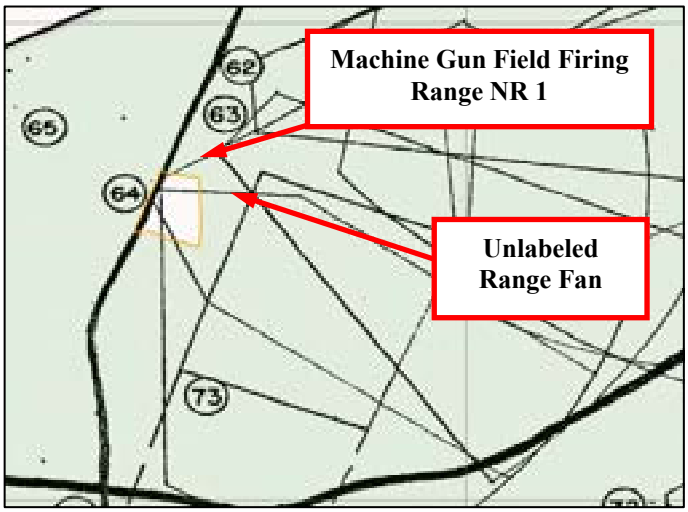

Figure 4-12: 1956 Training Facilities Map with FJFC Overlay

The 1957 map identifies a Technique of Rifle Fire w/ Distrib. and an M-1 Night Firing range that overlap the FJFC. The Technique of Rifle Fire w/ Distrib. range fan covers the northern and eastern portions of the FJFC. The M-1 Night Firing range covers the southern and eastern portions of the FJFC. The 1969 Master Plan Map (Figure 4-13) shows three range fans intersecting the FJFC. The two northern-most range fans are labeled Technique of Rifle Fire Range Salerno and the southern-most range fan is labeled Night Fire and Vision Range Saint Lo. The 1969 map uses the terms "Salerno" and "Saint Lo" for the first time to identify the ranges overlapping the FJFC.

Figure 4-13: 1969 Master Plan Map with FJFC Overlay

Information from a notebook located in the Range Control Office provided additional information on the usage of the Salerno and Saint Lo ranges during the 1960s and 1970s. A

sketch labeled Salerno Demonstration Overlay shows the relative location of four ranges: an M-60 machine gun range, an M-79 grenade launcher range, an M-72 Light Anti-tank Weapon (LAW) rocket launcher range, and an M18A1 mine range. A table attached to the sketch lists ammunition used at the Salerno range as of two dates. The January 3, 1964 entry lists .30-caliber and 7.62-mm ammunition. The April 9, 1970 entry lists LAW rockets, 40-mm grenades, and anti-personnel mines. This table also provides ammunition information for the Saint Lo range, with a January 3, 1964 entry indicating the use of .30-caliber and 7.62-mm ammunition. A historical photograph obtained from the National Archives depicts Army personnel training at an M-60 machine gun range (Figure 4-14). Fort Jackson personnel indicated that use of the Salerno and Saint Lo ranges ceased in 1973 and that the FJFC was established after 1982.

Figure 4-14: Firing at the M-60 range in 1969

The 1993 Forestry Field Map shows the presence of an "M79+40mm" rifle grenade range located in the northeastern-most portion of the FJFC. This location is shaded and labeled in the legend as "previous duds believed to have been cleared".

Aerial photographs from 1949 through 1970 were reviewed for evidence of training in the FJFC area. Disturbed areas were first visible on the 1955 aerial photograph. These areas were identified on other aerial photographs reviewed that were dated through 1970. The most evident land disturbance was shown in the 1955 aerial photograph (Figure 4-15).

Figure 4-15: Ranges Shown on 1959 Aerial Photograph

Table 4-7 below summarizes the historical time-line analysis of former range activities at the FJFC based on the maps reviewed.

Table 4-7: FJFC Map Summaries

Date of Map	Map Title	Map Observations
1946	Annex No. 1 Firing Ranges Map	No training was evident at the FJFC area.
1949	Fort Jackson and Vicinity Map	The Field Firing Machine Gun range and safety fan cover the majority of the northern and eastern portions of the FJFC. The Close Combat Range No. 2 safety fan extends into the southeastern corner of the FJFC.
1952	Location Map	The MG Field Firing #1 range location coincides with the Field Firing Machine Gun range shown on the 1949 map.
1955	Training Facilities Map	The Machine Gun Field Firing No. 1 range covers the majority of the FJFC. A smaller unlabeled range fan extends across the central portion of the FJFC.
1956	Training Facilities Map NR 2	The Machine Gun Field Firing Range NR 1 intersects the majority of the FJFC (same as 1955 map). The smaller unlabeled range fan shown on the 1955 map is also shown on the 1956 map.
1957	Basic Information for Master Plan Map	The Technique of Rifle Fire w/ Distrib. range fan covers the northern and eastern portions of the FJFC. The M-1 Night Firing range overlaps the Technique of Rifle Fire w/ Distrib. range and covers the southern and eastern portions of the FJFC. The Technique of Rifle Fire w/ Distrib. range is to the north of the M-1 Night Firing range and has a wider fan.
1969	Master Plan Map	Three range fans are shown that intersect the FJFC. The two northern range fans are labeled Technique of Rifle Fire Range Salerno. The southern-most range fan is labeled Night Fire and Vision Range Saint Lo.
1993	Forestry Field Map	A shaded area in the northeastern portion of the FJFC is labeled “M79+40mm”. The legend identifies this area as “previous duds believed to have been cleared”.

4.2.3 Weston Lake Area Ranges/Sites

The Weston Lake Area, located in the south-central portion of the installation, contains four closed ranges that were identified in the CTT Range Inventory (i.e., the Mortar Range, Hand Grenade Court No. 2, Rifle Grenade Range NR 2, and Submachine Gun Area). Due to a change of the operational range boundary, two of these sites (Hand Grenade Court No. 2 and Rifle Grenade Range NR 2) were determined to not be eligible for evaluation as part of the Fort Jackson SI. The findings and modifications based on information obtained during the HRR, including additional munitions types identified and acreage changes, are presented in the following subsections. Map 4-8 shows the Weston Lake Area range details. Map 4-10 shows the differences in the CTT Range Inventory and HRR range locations. Map 4-11 shows the Weston Lake Area MMRP sites.

4.2.3.1 Mortar Range

The 306-acre Mortar Range is located in the northern section of the Weston Lake Area, north of the Hand Grenade Court No. 2 and west of the Submachine Gun Area. According to the CTT Range Inventory, this area (identified as Mortar Range No. 8) was a buffer (safety) area for a mortar range that was used in the 1940s. The CTT Range Inventory also indicated that other ranges overlapped this area, including 8-inch, 105-mm, and 155-mm Howitzer ranges. The Submachine Gun Area also overlapped the Mortar Range. For acreage reporting purposes, the CTT Range Inventory depicted the Mortar Range and the Submachine Gun Area as a contiguous area divided in half, with the west side designated as the Mortar Range (112 acres) and the east side designated the as Submachine Gun Area (101 acres). However, based on the 1955 and 1956 Training Facilities Maps, the Mortar Range actually covers both the Mortar Range and most of the Submachine Gun Area reported in the CTT Range Inventory. For the HRR, the MMRP site boundary and acreage associated with the Mortar Range was increased to encompass the entire portion of the Mortar Range in the other than operational area, where as the Submachine Gun Area was decreased to include only the area not overlapped by the Mortar Range.

The 1952 Fort Jackson Location Map shows an area labeled "MTR #8" approximately 0.3 mile west of Washington Light Infantry Road. It is assumed that this is the location of the firing points, which are in an operational area. The 1955 and 1956 Training Facilities Maps show the Mortar Range No. 8 in the same location and oriented from west to east. Additionally, the 1955 map indicates the mortar range had 12 firing points. Both training maps depict a larger range fan almost directly overlapping Mortar Range No. 8. This fan is not labeled on either map and has not been identified on other maps reviewed. The majority of the 306 acres associated with the Mortar Range identified during this HRR consist of the portion of Mortar Range No. 8 that falls within the other than operational area at the Weston Lake Area. The remainder of the former Mortar Range No. 8, including the impact area, falls within the operational area. Mortar Range No. 8 was not identified on maps prior to 1952.

The 1955 Training Facilities Map shows two additional mortar range fans, Mortar Range No. 7 and Mortar Range No. 5A, overlapping the Mortar Range. Only the farthest extents away from the firing points of these two mortar range fans overlap the Mortar Range. The 1956 Training Facilities Map shows the same overlapping range fans; however, they are not labeled. The relationship of the three mortar range fans is depicted in Figure 4-16.

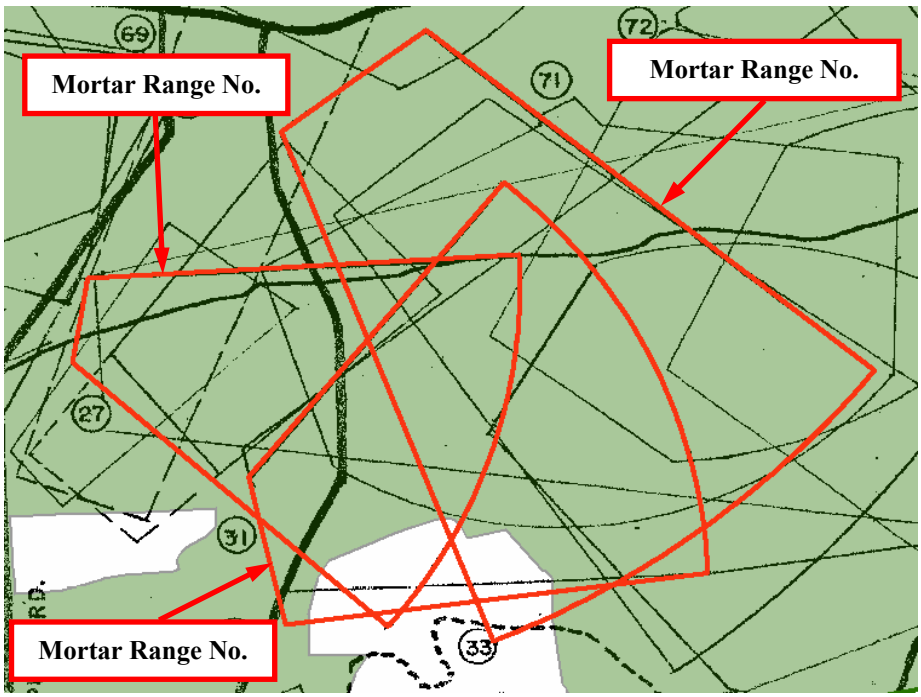

Figure 4-16: 1956 Training Facilities Map with Weston Lake Area Overlay

The 1957 Basic Information Map shows a mortar training area south of the eastern portion of the Mortar Range. However, no associated range fan was identified. The 1957 map also shows the Machine Gun Field Firing Range No. 1 and Machine Gun Field Firing Range No. 2 overlapping the eastern portion of the Mortar Range. These two ranges originate southeast of the Mortar Range, and only the surface danger zones associated with these ranges overlap the Mortar Range.

The 1969 Master Plan Map shows several range fans that overlap the Mortar Range. These range fans are identified as follows: 105-mm Howitzer Position No. 5; 155-mm Howitzer Position No. 2; 155-mm Howitzer Position No. 6; 155-mm Howitzer Position No. 8; and 8-inch Howitzer Position No. 9. These range fans originate from the west and overlap the entire Mortar Range. Map 4-9 shows the Howitzer range fan configurations. According to installation personnel, even though the Howitzer range fans overlap the Mortar Range, Howitzer-associated MEC are not likely to be found on the Mortar Range or other Weston Lake Area ranges because the firing points and impact areas of the Howitzer ranges were not located on or near the Weston Lake Area ranges. Review of the 1950 Fort Jackson Range Regulations and associated map overlays indicated that the Howitzer firing positions were located west of Washington Light Infantry Road and the impact area was northeast of the Weston Lake Area. Based on historical research, Howitzer ranges were operated by range personnel so that gun crews could restrict the gun's elevation and select the amount of propellant charge to control the downrange distance and hit the targets/impact areas. Short rounds are not anticipated at the Howitzer ranges based on the standard operating procedures. Because neither the firing points nor the impact areas for the Howitzer ranges lie in the other than operational range areas, these ranges were not evaluated under this HRR.

The 1969 map also shows the Machine Gun Field Fire No. 1, Cassino Range that originates from the south and overlaps the eastern portion of the Mortar Range. The Rifle Squad in Technique of Rifle Fire Range RSTT No. 1 originates from the north and overlaps the northeastern portion of the Mortar Range. Five additional range fans overlap the eastern

portion of the Mortar Range; however, these range fans are not labeled. No other maps reviewed show these unlabeled range fans.

The 1949 Fort Jackson and Vicinity Map does not show the Mortar Range; however, it does show the Dismounted Submachine Gun Range Nos. 1 and 2 fans and the farthest extent of the Close Combat Range No. 1 fan overlapping the Mortar Range. Neither the Mortar Range nor the Close Combat Range No. 1 appears on the 1946 Annex No. 1 Firing Ranges Map. This indicates that the Mortar Range was used in the 1950's rather than the 1940s as indicated in the CTT Range Inventory.

Aerial photographs from 1949 through 1970 were reviewed for evidence of mortar training in the Weston Lake Area. The portion of the Mortar Range in the other than operational area associated with the Weston Lake Area includes the safety fan, but not the firing points or impact areas of the Mortar Range. Evidence of mortar training in the Weston Lake Area was not observed in the aerial photographs, as expected based on the area being within the safety fan. Review of historical correspondence dating back to 1941 indicates that the Weston Lake (historically Weston Pond) Area was designated as off-limits for training. Based on the historical correspondence, the area surrounding Weston Lake has been used for recreational purposes since the 1940s.

4.2.3.2 Hand Grenade Court No. 2

The 18-acre Hand Grenade Court No. 2 is located in the northern portion of the Weston Lake Area, south of the Mortar Range. The CTT Range Inventory estimated that the period of use for this range was from 1944 to 1950. The acreage associated with the Hand Grenade Court No. 2 in the CTT Range Inventory was three acres. Based on additional information obtained during the research conducted for the HRR, the acreage associated with hand grenade training was increased to 18 acres. During review of the draft HRR, additional mapping sources were identified that more accurately identified the operational range boundary. Based on this revised boundary, the Hand Grenade Court No. 2 is located within the operational range area and is not eligible for evaluation as part of the Fort Jackson SI.

The following information obtained during the HRR is included for informational purposes only.

The Hand Grenade Court No. 2 is labeled on the 1952 Fort Jackson Location Map and is shown approximately 0.6 mile south of the Mortar Range No. 8. The location of Hand Grenade Court No. 2 appears to be just on the west side of Washington Light Infantry Road, which is an operational area. No associated range fan is shown on the 1952 map. Based on the review of historical documents and aerial photographs, it appears that hand grenade training occurred on both sides of Washington Light Infantry Road. However, research performed for this HRR focused only on the other than operational area, which is east of Washington Light Infantry Road.

The 1955 Training Facilities Map shows the location of the Hand Grenade Court No. 2 with an associated range fan on the east side of Washington Light Infantry Road (Figure 4-17). The 1956 Training Facilities Map only shows the reference number associated with the Hand Grenade Court No. 2, but does not show the range location.

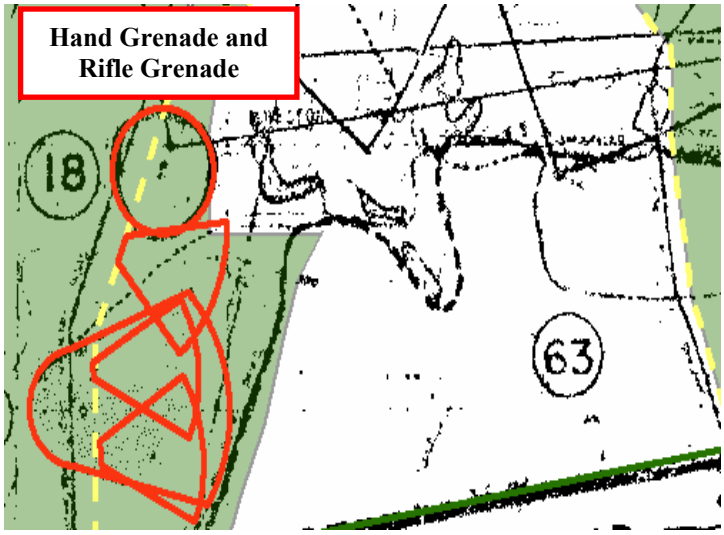

Figure 4-17: 1955 Training Facilities Map

An aerial photograph dated October 3, 1947 shows the land disturbed along the east side of Washington Light Infantry Road where rifle grenade and hand grenade training activities are assumed to have occurred. Aerial photography from March 29, 1955 shows a closer view of the same disturbed areas. A 1959 aerial photograph shows a firing line and a disturbed area that appears to be a hand grenade pit (impact area). The portion of this aerial photograph showing the Hand Grenade Court No. 2 is included as Figure 4-18. The aerial photograph confirms the use of the areas east and west of Washington Light Infantry Road for training purposes. Based on the maps and aerial photographs reviewed, it is assumed that both rifle grenades and hand grenades were used at this site.

Figure 4-18: Hand Grenade Court No. 2 shown on 1959 Aerial Photograph

4.2.3.3 Rifle Grenade Range NR 2

The 109-acre Rifle Grenade Range NR 2 is located in the southwestern portion of the Weston Lake Area. According to the CTT Range Inventory, this range was located south of the Hand Grenade Court No. 2 and was shown on several maps from the 1940s through the 1960s as a rifle grenade range. The Hand Grenade Court No. 2 is located in the northern portion of the Weston Lake Area, south of the Mortar Range. The CTT Range Inventory estimated that the period of use for the Rifle Grenade Range NR 2 was from 1944 to 1950. The acreage associated with the Rifle Grenade Range NR 2 in the CTT Range Inventory was 90 acres. Based on additional information obtained during the HRR, the acreage was increased to 109 acres to include the additional areas identified that were used in conjunction with the range. During review of the draft HRR, additional mapping sources were identified that more accurately identified the operational range boundary. Based on this revised boundary, the Rifle Grenade Range NR 2 is located within the operational range area and is not eligible

for evaluation as part of the Fort Jackson SI. The following information obtained during the HRR is included for informational purposes only.

The 1949 Fort Jackson and Vicinity Map shows three range fans identified as Hand Grenade & Rifle Grenade No. 2 (Figure 4-19). The ranges are oriented in an easterly/southeasterly direction and are located on the east side of Washington Light Infantry Road. These ranges are not shown on the 1946 Annex No. 1 Firing Ranges Map.

Figure 4-19: 1949 Fort Jackson and Vicinity Map

The Rifle Grenade Range NR 2 is shown on the 1952 Fort Jackson Location Map in approximately the same location as the 1949 map. However, the 1952 map depicts the range fan originating on the west side of Washington Light Infantry Road and extending across the road to the east. The 1955 and 1956 Training Facilities Maps also show the location of the Rifle Grenade Range NR 2 with the range fan originating on the west side of Washington Light Infantry Road. Based on review of historical maps, it appears that the administrative area of the range may have been located on the west side of Washington Light Infantry Road. This would indicate that the firing points were located on the east side of the road. The 1952, 1955, and 1956 maps show the majority of the range fan extending east of Washington Light Infantry Road. These maps do not show other ranges or range fans overlapping the Rifle Grenade Range NR 2.

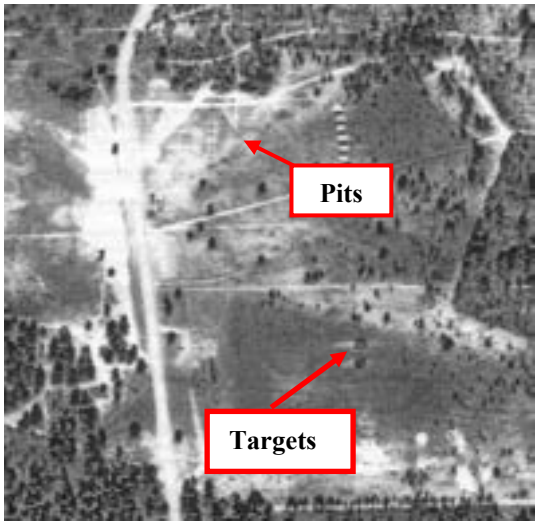

Figure 4-20: Rifle Grenade Range NR 2 shown on 1959 Aerial Photograph

Based on review of aerial photographs, two distinct training areas on the east side of the road are evident, just before the Washington Light Infantry Road turns to the northeast. Range use is visible on the east side of the road in the 1959 aerial photograph (Figure 4-20). Hand grenade pits and rifle grenade targets are visible in the photograph. Based on the information obtained for the HRR, it is assumed that both rifle and hand grenades were used at this site. The Rifle Grenade Range NR 2 is also identified on a 1993 Forestry Field Map as a "Known Dud Area".

4.2.3.4 Submachine Gun Area

The 17-acre Submachine Gun Area is located in the northern part of the Weston Lake Area. According to the CTT Range Inventory, this area is made up of three separate ranges, including the Dismounted Submachine Gun No. 1, the Moving Vehicle Submachine Gun, and the Dismounted Submachine Gun No. 2 ranges. These range fans overlap, with the direction of fire to the north/northwest into the East Impact Area. As discussed in the Mortar Range section above, the CTT Range Inventory depicted the Mortar Range and the Submachine Gun Area as a contiguous area divided in half, with the west side designated the Mortar Range (112 acres) and the east side designated the Submachine Gun Area (101 acres). However, based on the 1955 and 1956 Training Facilities Maps, the Mortar Range actually covers both the Mortar Range and the Submachine Gun Area reported in the CTT Range Inventory.

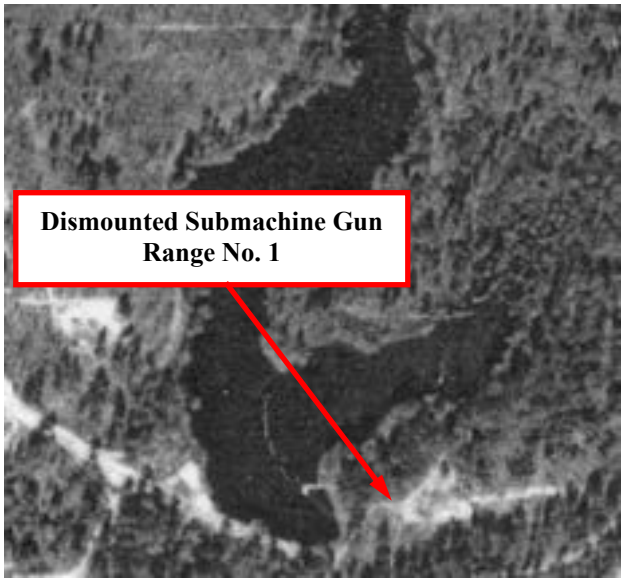

Figure 4-21: 1966 Aerial Photograph of Dismounted Submachine Gun Area

For the HRR, the Submachine Gun Area site boundary and acreage were reduced to include only the area not overlapped by the Mortar Range. As such, the acreage for the Submachine Gun Area was reduced from 101 acres to 17 acres. This area is shown on the 1966 aerial photograph included as Figure 4-21. For the HRR, aerial photography from 1949 to 1970 was also reviewed. The aerial photographs show that the Dismounted Submachine Gun Range firing points and target areas were located on a finger of land adjacent to Weston Pond. During the 1970s, the Weston Ponds were expanded to form Weston Lake. The firing points and target areas for this site are currently located on the shoreline of Weston Lake.

The 1946 Annex No. 1 Firing Ranges Map shows the Dismounted Submachine Gun No. 1 range with what appears to be firing points at three locations (two points at each of the three locations). The Dismounted Submachine Gun No. 2 range is located east of the Dismounted Submachine Gun No. 1 range and also has the same range layout. The Moving Vehicle Submachine Gun range is located between the Dismounted Submachine Gun No. 1 and No. 2 ranges. The Dismounted Submachine Gun No. 2 and the Moving Vehicle Submachine Gun range firing points are located in the operational area. However, the range fans extend into the other than operational area. According to the map, the direction of fire for all three ranges was north/northwest with the range fans covering an area from west of Washington Light Infantry Road to east of Timmonsville Guard Road.

The 1949 Fort Jackson and Vicinity Map shows the same general locations of the Dismounted Submachine Gun Nos. 1 and 2 and Moving Vehicle Submachine Gun ranges as the 1946 map; however, the range fans on the 1949 map are positioned slightly farther southwest. Additionally, the 1949 map shows the farthest extent of the Close Combat Range No. 1 fan overlapping the Submachine Gun Area.

The 1950 Fort Jackson Range Regulations include information regarding the Dismounted Submachine Gun No. 1 range. The 1949 map shows the range location, safety fan, and danger area, as described in these range regulations. Figure 4-22 shows a schematic for the range that was included in the range regulations. The range regulations state that there were three firing points located on this range. The regulations also note the type of weapons fired at the range included the M3A1 .45 caliber submachine gun and the Thompson M1928A1 .45 caliber submachine gun.

The 1957 Basic Information Map shows the Machine Gun Field Firing Range No. 1 and Machine Gun Field Firing Range No. 2 overlapping the Submachine Gun Area. Both of these ranges originate southeast of the Submachine Gun Area. The 1957 map does not show the Dismounted Submachine Gun Nos. 1 and 2 or the Moving Vehicle Submachine Gun ranges. This indicates that the ranges were no longer being used in 1957.

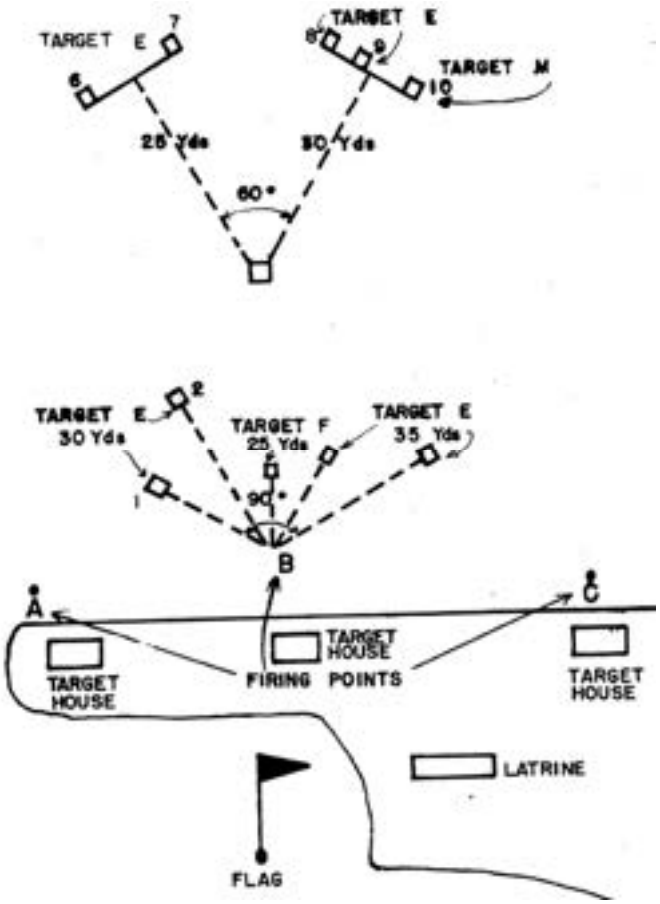

Figure 4-22: Dismounted Submachine Gun Range No. 1 Schematic Diagram

Table 4-8 summarizes the historical use and overlapping range information obtained for the Weston Lake Area ranges.

Table 4-8: Weston Lake Area Ranges Historical Use Summary

MMRP Ranges/Sites	1946 Map	1949 Map	1952 Map	1955 Map	1956 Map	1957 Map	Historical Use	Overlapping Ranges
Weston Lake Area								
Mortar Range			X	X	X		Mortar training	Submachine Gun Area, Hand Grenade Court No. 2, Howitzer Safety Fans
Hand Grenade Court No. 2		X	X	X	X		Hand/rifle grenade training	Mortar Range, Howitzer Safety Fans
Rifle Grenade Range NR 2		X	X	X	X		Hand/rifle grenade training	Howitzer Safety Fans
Submachine Gun Area	X	X					Small arms	Mortar Range, Howitzer Safety Fans

Table 4-9 provides a summary of the time-line analysis and map observations made for the Weston Lake Area ranges that are discussed in the previous sections.

Table 4-9: Weston Lake Area Map Summaries

Time Frame	Map Titles	Map Observations
1918-1926	1918 Location Map 1918 Key Map of Property 1919 General Map 1920 Special Military Map 1926 National Forest Map	No information on the Weston Lake Area MMRP sites was located on the 1918-1926 maps reviewed. In the Weston Lake Area, the installation boundary during 1918-1926 was approximately 5,000 feet north of the present boundary, so many of these locations would have been outside Camp Jackson and would not have had range use.

Time Frame	Map Titles	Map Observations
1946-1957	1946 Annex No. 1 Map 1949 Fort Jackson and Vicinity Map 1952 Location Map 1955 Training Facilities Map 1956 Training Facilities Map NR 2 1957 Basic Information Map	The ranges observed during this time frame include the following: Mortar Range No. 8, Mortar Range No. 7, Mortar Range No. 5A, Close Combat Range No. 1, Dismounted Submachine Gun No. 1, Dismounted Submachine Gun No. 2, Moving Vehicle Machine Gun, Rifle Grenade Range NR 2, Machine Gun Field Firing Range No. 1, and Machine Gun Field Firing Range No. 2.
1969	1969 Master Plan Map	The 1969 map does not show any of the areas identified as MMRP sites. However, the following 11 overlapping fans were identified: 105-mm Howitzer Position No. 5, 155-mm Howitzer Position No. 2, 155-mm Howitzer Position No. 6, 155-mm Howitzer Position No. 8, and 8-inch Howitzer Position No. 9, Machine Gun Field Fire No. 1 (Cassino Range), Rifle Squad in Technique of Rifle Fire Range RSTT No. 1, and five unlabeled range fans.

4.3 POTENTIAL MEC AND MC

Table 4-10 on the following page presents the potential MEC and the associated MC that are expected to be found at the Cantonment Area, FJFC, and Weston Lake Area ranges. The table includes information for each Munitions Response Site (MRS) and the associated sub areas. This information is based on the findings of the research conducted for the HRR.

Table 4-10: Summary of Potential MEC and MC

MRS	Sub Area	Potential Munitions	Primary Release Mechanism	Potential MEC	Potential MC
***Camp Jackson Ranges* (includes 1000-Yard Range, 600-Yard Range, 300-Yard Range, Machine Gun Range, and Pistol Range)**	Firing Points/Lines Target Areas Overlapping Range Fans: Small Arms Ranges East of Chesnut Road (Transition No. 1, M-1 Transition only), and Live Hand Grenade Court 2 (overlaps the 300-Yard Range only)NR1, and Pistol Range NR2	.30-/.45-/.50-caliber	Munitions firing, potentially from the following guns: Springfield Model 1903, M1909 Revolver (.45 Colt caliber), M1917 Revolver, Enfield M1917 Rifle, Browning .30 caliber M1917 Machine Gun, Mk 2 .50 Machine Gun	None (small arms use only)	Black powder (potassium nitrate, sulfur, and charcoal) Smokeless powder (nitrocellulose, dinitrocellulose [DNT], dibutylphalate, and diphenylamine) Double based propellant (nitrocellulose and nitroglycerin) Lead (Pb), Antimony (Sb), Arsenic (As), Copper (Cu), Tin (Sn), Zinc (Zn), Iron (Fe), Strontium (Sr), Magnesium (Mg), and lead styphnate/lead azide

MRS	Sub Area	Potential Munitions	Primary Release Mechanism	Potential MEC	Potential MC
Live Hand Grenade Court 2	Impact Area Overlapping Range Fans: Camp Jackson Ranges (300-Yard Range only) and Small Arms Ranges East of Chesnut Road	Hand grenades: MK2 Fragmentation (Frag), MK II Practice, M26/61 Frag, M30/62 Practice, M48E1 Smoke, M69 Practice, M18 Smoke, M26A2 Frag, M57 Frag, M34 Smoke, M59/68 Frag	Munitions firing (throwing)	Non-functioned grenades/fuzes	Black powder (potassium nitrate, sulfur, and charcoal) Smokeless powder (nitrocellulose, DNT, dibutylphalate, and diphenylamine) Double based propellant (nitrocellulose and nitroglycerin) Composition B TNT Octol RDX White Phosphorous (WP)

MRS	Sub Area	Potential Munitions	Primary Release Mechanism	Potential MEC	Potential MC
Small Arms Ranges East of Chesnut Road **(Includes Transition Range, Pistol Range NR 2, Landscape Target Range, and 1000-Inch Range Nos. 14, 15, 16)**	Firing Points/Lines Target Areas Overlapping Range Fans: Camp Jackson Ranges and Live Hand Grenade Court 2	.30-caliber .45-/.22-caliber	Munitions firing, potentially from the following guns: Springfield Model 1903, M1909 Revolver (Colt .45 caliber), M1917 Revolver, Enfield M1917 Rifle, M-1 Garand Rifle, M-1 Carbine, M1911 and M19111A1 .45-caliber pistol	None (small arms use only)	Black powder (potassium nitrate, sulfur, and charcoal) Smokeless powder (nitrocellulose, DNT, dibutylphalate, and diphenylamine) Double based propellant (nitrocellulose and nitroglycerin) Pb, Sb, As, Cu, Sn, Zn, Fe, Sr, Mg, and lead styphnate/lead azide

MRS	Sub Area	Potential Munitions	Primary Release Mechanism	Potential MEC	Potential MC
FJFC Salerno Ranges	Firing lines and impact areas for the Salerno Ranges (M-72, M-79, and M18A1) Overlapping Range Area for the Field Firing Machine Gun Range NR 1, Technique of Rifle Fire Range, Night Fire and Vision Range (Saint Lo), and Salerno Range (M-60 only)	66-mm rockets, rocket grenades, 40-mm grenades, 35-mm sub-caliber rockets, M18A1 anti-personnel mines, practice grenades 30-/.50-caliber, 7.62-mm, 5.56-mm	M79 Grenade Launcher, M72 LAW, 3.5-in Rocket Launcher, M18A1 Claymore Mine Browning .30 M1917 Machine Gun, Mk 2 .50 Machine Gun M-60 Machine Gun Springfield Model 1903, Enfield M1917 Rifle, M-1 Garand Rifle, M-1 Carbine, M14 Rifle, M16 Rifle	Non-functioned ordnance, including rockets, rocket grenades, and anti-personnel mines (refer to potential munitions)	Composition B TNT Octol RDX WP C-4 Smokeless powder (nitrocellulose, DNT, dibutylphalate, and diphenylamine) Double based propellant (nitrocellulose and nitroglycerin) Pb, Sb, As, Cu, Sn, Zn, Fe, Sr, Mg, and lead styphnate/lead azide

MRS	Sub Area	Potential Munitions	Primary Release Mechanism	Potential MEC	Potential MC
FJFC Small Arms Ranges	Firing lines and target areas for the Field Firing Machine Gun Range NR 1, Technique of Rifle Fire Range, Night Fire and Vision Range (Saint Lo), and Salerno Range (M-60 only) Overlapping Range Area: Close Combat No. 2 Range	30-/.50-caliber, 7.62-mm, 5.56-mm	Browning .30 M1917 Machine Gun, Mk 2 .50 Machine Gun M-60 Machine Gun Springfield Model 1903, Enfield M1917 Rifle, M-1 Garand Rifle, M-1 Carbine, M14 Rifle, M16 Rifle	None (small arms use only)	Smokeless powder (nitrocellulose, DNT, dibutylphalate, and diphenylamine) Double based propellant (nitrocellulose and nitroglycerin) Pb, Sb, As, Cu, Sn, Zn, Fe, Sr, Mg, and lead styphnate/lead azide

MRS	Sub Area	Potential Munitions	Primary Release Mechanism	Potential MEC	Potential MC
Mortar Range	Area between the firing points and targets (safety fan) Overlapping Range Fan Area: Submachine Gun Area, Artillery Range Safety Fans, Close Combat Range, Machine Gun Ranges, Rifle Range, Hand Grenade Court No. 2	3-in stokes, 4.2-in stokes, 60-mm, and 81-mm mortar rounds .30-/.45-/.50-caliber, live and practice grenades	Mortar and Munitions firing	Non-functioned ordnance, including mortar shells and grenades	Black powder (potassium nitrate, sulfur, and charcoal) Smokeless powder (nitrocellulose, DNT, dibutylphalate, and diphenylamine) Double based propellant (nitrocellulose and nitroglycerin) Pb, Sb, As, Cu, Sn, Zn, Fe, Sr, Mg, and lead styphnate/lead azide RDX Octol Illumination Mix (flare) Composition B TNT WP

MRS	Sub Area	Potential Munitions	Primary Release Mechanism	Potential MEC	Potential MC
Submachine Gun Area	Firing points and safety fan Overlapping Range Fan Area: Artillery Range Safety Fans	.45-caliber submachine gun ammunition	Munitions firing, potentially from the following guns: M1A1 Thompson, M1928 Thompson, M3, M3A1 (grease gun)	None (small arms use only)	Black powder (potassium nitrate, sulfur, and charcoal) Smokeless powder (nitrocellulose, DNT, dibutylphalate, and diphenylamine) Double based propellant (nitrocellulose and nitroglycerin) Pb, Sb, As, Cu, Sn, Zn, Fe, Sr, Mg, and lead styphnate/lead azide

5 CONCEPTUAL SITE MODEL

5.1 CANTONMENT AREA RANGES/SITES

5.1.1 MMRP Site Profile

5.1.1.1 Area and Layout

The cantonment area is located on the western portion of the installation. A total of 10 ranges located within the cantonment area are evaluated in this HRR. Four of these ranges were identified in the CTT Range Inventory (1000- and 600-Yard Ranges, Machine Gun Range, and the Live Hand Grenade Court 2). Six additional ranges were identified during the preparation of this HRR. Based on geographical location and period of use, the cantonment area ranges have been grouped into the following three MMRP sites: Camp Jackson Ranges, Small Arms Ranges East of Chesnut Road, and the Live Hand Grenade Court 2.

The Camp Jackson Ranges comprise 81 acres and consist of the 1000-Yard Range, 600-Yard Range, 300-Yard Range, Machine Gun Range, and Pistol Range. The Small Arms Ranges East of Chesnut Road occupy 546 acres and consist of the Transition Range; 1000-Inch Range Nos. 14, 15, 16; Pistol Range NR 2; and the Landscape Target Range. The Live Hand Grenade Court No. 2 covers 3 acres.

Geographical features of the Camp Jackson Ranges are as follows:

- The 1000-Yard Range is located just northeast of the center of the cantonment area in between Hartsville Guards Road and Semmes Road. The 1000-Yard Range is long, narrow, and rectangular-shaped and runs in an east-west direction.

- The 600-Yard Range is located immediately south of the 1000-Yard Range. The 600-Yard Range is also rectangular in shape, but is not as narrow as the 1000-Yard Range. The long axis of the range is also oriented in an east-west direction.

- The 300-Yard Range is located on the eastern portion of the cantonment area, south of the 1000- and 600-Yard Ranges and east of the Machine Gun Range. The 300-Yard Range is generally trapezoidal in shape and is oriented in a general north-south direction.

- The Machine Gun Range is located south of the 1000- and 600-Yard Ranges and east of Chesnut Road. The Machine Gun Range has a narrow rectangular shape and is oriented with its long axis in a north-south direction.

- The Pistol Range is located east of Chesnut Road. The range is rectangular in shape and is generally orientated in a southwest-northeast direction.

The Camp Jackson Ranges cover 81 acres in the cantonment area. All of the Camp Jackson Ranges were used for small arms training. They are not all contiguous. The 1000- and 600-Yard Ranges are contiguous, and the Pistol Range and Machine Gun Range overlap.

Geographical features of the Small Arms Ranges East of Chesnut Road are as follows:

- The Transition Range is located east of Chesnut Road between Hartsville Guards Road and Semmes Road. This range is generally rectangular in shape and overlaps the majority of the 1000-Inch Range Nos. 14, 15, 16. The Transition Range is oriented in an east-west direction.

- The 1000-Inch Range Nos. 14, 15, 16 is located southeast of Golden Arrow Road and along the northeast side of Hartsville Guards Road. The range is generally rectangular in shape, with its range fan directed to the southeast.

- The Pistol Range NR 2 is located southwest of the Machine Gun Range. The range is generally rectangular in shape, with its range fan directed to the east.

- The Landscape Target Range is located near the southeastern portion of the cantonment area. The firing direction for this range is northwesterly, and the

Transition Range overlaps the portions of the Landscape Target Range's fan that fall within the other than operational area.

The Small Arms Ranges East of Chesnut Road cover approximately 546 acres in the cantonment area.

The Live Hand Grenade Court 2 consists of approximately three acres and is located south of the Machine Gun Range. Based on historical maps, the throwing lines and trenches were oriented north and south with grenades most likely thrown east and west. The Live Hand Grenade Court 2 represents the approximate size and location of the former hand grenade court throwing lines and impact areas.

5.1.1.2 Structures

Base housing exists on the western-most portion of the 1000-Yard Range. The remaining area of the former 1000-Yard Range, the 600-Yard Range, the 300-Yard Range, and the Live Hand Grenade Court 2 and their immediate surrounding areas are undeveloped. The former Machine Gun and Pistol Ranges are located just west of a school; however, the area of the Machine Gun Range is undeveloped. The southwestern portion of the Pistol Range appears to overlap portions of the schoolyard. The majority of the Transition Range and the 1000-Inch Range Nos. 14, 15, 16 are undeveloped; however, it appears that a recreational area, which consists of a baseball field, football field, and a youth sports center, is located near the western portion of the former Transition Range. A school is located north of the recreational area and could also be located on portions of the former Transition Range.

5.1.1.3 Utilities

A school, base housing, and Chesnut Road are located in close proximity to the western boundaries of the following former ranges: 1000- and 600-Yard Ranges, Pistol Range, Machine Gun Range, Transition Range, and Pistol Range NR 2. The 1000-Yard Range has power lines on portions of it. The school area (which contains overhead electrical lines) and associated recreational area may also be located on portions of the former Transition Range.

Additionally, the Live Hand Grenade Court 2 area is located off of Chesnut Road, which is close to the Pierce Terrace base housing complex. There is potential that underground utilities could exist on range areas that are located in close proximity to cantonment facilities. It has not been determined whether there are utilities located in the area of the 1000-Inch Range Nos. 14, 15, 16.

5.1.1.4 Boundaries

Table 5-1 displays the boundaries of the MMRP sites in the cantonment area.

Table 5-1: Cantonment MMRP Site Boundaries

MMRP Site	Range	Western Boundary	Eastern Boundary	Northern Boundary	Southern Boundary
Camp Jackson Ranges	1000-Yard Range	Undeveloped land	Undeveloped land	Undeveloped land	School, recreational facility, 600-Yard Range
	600-Yard Range	Undeveloped land	Undeveloped land	School, recreational facility, 1000-Yard Range	Undeveloped land
	300-Yard Range	Undeveloped land	Undeveloped land	Undeveloped land	Undeveloped land
	Machine Gun Range	Undeveloped land	Undeveloped land	Undeveloped land	Undeveloped land
	Pistol Range	Undeveloped land	Undeveloped land	Undeveloped land	Undeveloped land
Live Hand Grenade Court 2		Undeveloped land	Undeveloped land	Undeveloped land	Undeveloped land
Small Arms Ranges East of Chesnut Road	Pistol Range NR 2	Undeveloped land	Chesnut Road	Undeveloped land	Undeveloped land
	1000-Inch Range Nos. 14,15,16	Undeveloped land	Undeveloped land	Undeveloped land	Undeveloped land
	Transition Range	School, recreational facility, Chesnut Road, and base housing	Undeveloped land	Undeveloped land	Undeveloped land
	Landscape Target Range	Undeveloped land	Undeveloped land	Undeveloped land	Just north of installation boundary

5.1.1.5 Security

The cantonment area MMRP sites are located within the boundaries of the Fort Jackson installation. The majority of the cantonment area has been enclosed by security fencing and access is controlled at guarded gates. Outside the fenced area, access is limited by gates and/or roadblocks on all roads leading into the installation. Access to the installation is restricted to Army personnel, authorized civilian personnel, contractors, and visitors. Security personnel routinely patrol the cantonment area by vehicle. The individual ranges within the cantonment area ranges are not fenced.

5.1.2 Physical Profile

5.1.2.1 Climate

Fort Jackson is in a humid continental area. Predominant climatic factors are the installation's location in the lower latitudes and its proximity to the Appalachian Mountains to the west, which block the approach of unseasonable cold weather in winter. This southern temperate region can experience temperatures ranging from below freezing to greater than 100 degrees Fahrenheit (ºF); however, there is a relatively narrow annual temperature range, from a mean daily temperature of 81ºF in July to 44ºF in January.

The Bermuda high, a semi-permanent high pressure cell centered in the Atlantic Ocean, dominates summer weather. The influx of warm moist air from the south causes days to be hot and humid. The average high temperature in July, the hottest month of the year, is 91ºF. Temperatures greater than 90ºF are experienced an average of 66 days per year. Winters are generally mild, and January, the coldest month, has an average daily minimum temperature of about 32ºF. Temperatures below freezing are experienced an average of 61 days a year. The frost-free growing season is about 190 days, with the first frost occurring in late October and the last frost usually occurring in mid-April.

The average annual precipitation is 46 inches, with summer rains constituting 39% of annual rainfall. Average monthly rainfall for July and August is five to six inches. Minimum

amounts of rainfall occur during October and November, when monthly averages are about three inches. About every five years an ice storm occurs, severe enough to cause some timber damage. Every few years a tropical storm will cause heavy rains for two or three days. In extremely rare instances, storm winds will come inland far enough to cause damage, such as occurred during Hurricane Hugo in 1989.

5.1.2.2 Geology

Fort Jackson is on the northwestern edge of the Atlantic Coastal Plain Province, a region of low to moderate relief and gently rolling plains, known as the Sand Hills. The Fall Line, a zone that marks the boundary between younger, softer sediments of the Province and ancient, crystalline rocks of the Piedmont Province, lies about four miles west of the cantonment area.

The principal geologic formation in the Sand Hills is the Tuscaloosa Formation, which consists of marine deposits of light-colored sands and kaolin clays. Most soils at Fort Jackson are formed from sediment of the Tuscaloosa Formation. A layer of Quaternary sand terrace overlies the Tuscaloosa Formation, which`, and arkosic sands. It lies unconformably on the peneplained surface of crystalline rocks.

5.1.2.3 Topography

Gently to moderately rolling, moderately dissected high plains occupy most of Fort Jackson. Flat to gently rolling low plains characterize the extreme western portion of the installation, including a major portion of the cantonment area and the alluvial plains occupied by southwesterly flowing Gills and Mill creeks. Local relief around the valley of Gills Creek and its tributaries is generally less than 60 feet. Slopes are predominately between zero and three percent on the alluvial plains, and slopes in the cantonment area are predominately between three and eight percent.

5.1.2.4 Soil

Soils at Fort Jackson range from nearly level to strongly sloping, characteristic of the Sand Hills. Principal soil map units occurring on Fort Jackson are the Lakeland, Vaucluse-Ailey-Pelion, and Pelion-Johnston-Valcluse. The installation also has Blanton soil series and

various soil-urban land complexes. These soils are typically well drained on high plains and side slopes and poorly drained in valleys. Surface soil layers in the Sand Hills are usually sandy with predominantly loamy subsoil.

Within the cantonment area, facilities are developed on moderately well drained, fine sands, silts, and clays, which are part of various soil-urban land complexes. Pelion urban land complex is the major soil series within the cantonment. Pelion soils occur on side slopes of ridges, with typical slopes of two to 15%. Pelion soils are loamy sands, very strongly acidic with moderately slow permeability.

5.1.2.5 Hydrogeology

Groundwater is generally plentiful at Fort Jackson. The Tuscaloosa Formation, of Upper Cretaceous age, underlies Fort Jackson and is the primary source of groundwater in the area. Small quantities of groundwater may be available in alluvial deposits along major streams.

The Tuscaloosa Formation is at the surface over most of Fort Jackson. This formation lies unconformably on a peneplained surface of older, crystalline rocks. The formation consists of interbedded, generally unconsolidated, fine to coarse sand and clay, causing groundwater to occur under both unconfined and confined (i.e., artesian) conditions. Groundwater occurs under water table conditions in the upper part of the zone of saturation. At a depth of about 99-251 feet, permeable sand zones are frequently overlain by less permeable clay zones, and the groundwater exists under artesian conditions.

Groundwater in the Fort Jackson area is suitable for human consumption; water quality is considered excellent. Total dissolved solids are generally less than 50 milligrams per liter. Water standards are occasionally exceeded by slight concentrations of iron and manganese. Fort Jackson is not located within a recharge area for the sole-source aquifer. A figure from a 1997 environmental sampling report shows an active water supply well located southwest of Heise Pond and south of Semmes Road. This well is located south of the Live Hand Grenade Court No. 2 and the Transition Range. This figure also shows three active water

supply wells located just east of Weston Lake and a water supply well located in the vicinity of the FJFC.

5.1.2.6 Hydrology

Five separate watersheds receive surface water runoff from the Fort Jackson installation. These watersheds are drained by Wildcat, Gills, Colonels, Mill, and Cedar Creeks. Wildcat Creek drains most of the cantonment area of Fort Jackson and flows west, where it enters the Gills Creek drainage area just below Lake Katherine. The Gills Creek drainage area is the second largest drainage area of the installation and is in the extreme northwest corner of Fort Jackson. This creek flows south along the installation's western boundary and enters the southeast-flowing Congaree River south of Columbia. Colonels Creek is the installation's largest drainage basin and drains the entire eastern one third of Fort Jackson. Colonels Creek flows southeast and off-post, eventually discharging into the Wateree River, a tributary of the Congaree River. Mill Creek drains the southwestern portion of the installation, flows off-post, and eventually discharges into the Congaree River. Cedar Creek drains an area along the installation's southern boundary. Drainage from this area flows southward, off-post, and also eventually discharges into the Congaree River

5.1.2.7 Vegetation

The area of Fort Jackson encompasses a wide variety of vegetative site conditions ranging from bottomland hardwood communities to xeric longleaf pine communities. In general, Fort Jackson can be classified into five primary terrestrial vegetative types: pine, pine/upland hardwood, upland hardwood, bottomland hardwood, and open field. There are no grassland areas on Fort Jackson, except for a small amount in the cantonment area and alongside roads.

Vegetation on Fort Jackson is diverse and abundant. Field investigations and surveys have identified over 750 species of flora on the installation. There are no farmlands within the installation boundary. Forest cover is the principal vegetative type and may be grouped into eight major forest types: Natural Pine, Pine Plantation, Pine-Scrub Oak, Pine-Hardwood, Scrub Oak, Upland Hardwood, Bottomland Hardwood, and Hardwood-Pine.

5.1.3 Land Use and Exposure Profile

5.1.3.1 Current Land Use / Activities

The former ranges within the cantonment area consist of undeveloped forested land. Fort Jackson manages the facilities forest resources with annual timber harvests. Timber located on some of the former ranges may be cut during the annual harvest. A school and its associated recreational facilities are located within the western portion of the Transition Range.

5.1.3.2 Current Human Receptors

With the exception of the western portion of the former Transition Range, which is occupied by a school and associated recreational area, the majority of the areas within the cantonment ranges are undeveloped woodland and largely inaccessible by vehicle. Human receptors are limited to authorized installation personnel, contractors, visitors, and trespassers. School children, teachers, and school officials would be the human receptors for the areas of the western portion of the Transition Range.

5.1.3.3 Potential Future Land Use

Currently there are no plans to develop the former cantonment area ranges. Potential land use will continue to be consistent with forest management (i.e., timber harvesting).

5.1.3.4 Potential Future Human Receptors

Potential future human receptors would be limited to current use receptors, to include authorized installation personnel, contractors, visitors, and trespassers.

5.1.3.5 Zoning/Land Use Restrictions

The majority of the MMRP site land areas have a land use class of Cantonment Open Space. Some ranges, located immediately east of Chesnut Road, overlap other land use classifications. The Transition Range, the Pistol Range, and the 600-Yard Range slightly overlap a Community Facility land use class, and the western portion of the Machine Gun

Range overlaps a Housing land use class. No zoning or land use restrictions have been identified for the land areas of the ranges located in the Cantonment Open Space land use class.

5.1.3.6 Beneficial Resources

As stated previously, the area of Fort Jackson encompasses a wide variety of vegetative site conditions ranging from bottomland hardwood communities to xeric longleaf pine communities. Natural Pine and planted pine are the most important forest types on the installation, which include all pine stands regardless of species. Timber is harvested annually at Fort Jackson. The annual harvest of timber products on Fort Jackson consists of sales ranging in size from 200 to 4,000 cords.

According to the Revised Final Phase II RFI Report for the Wonsan (SWMU 12) and Inchon (SWMU 17) Explosive Ordnance Disposal Sites, a variety of mammals and birds are likely to find suitable habitat on Fort Jackson, particularly in the adult, select cut, long-leaf pine forests adjacent to the active impact areas or within the adjacent scrub-brush habitat present on the active impact and ranges. It is noted that the SWMU 12 and SWMU 17 sites are located just east of the Weston Lake Area. This document also reported that a total of 78 federal and/or state listed threatened and endangered species have been identified within Richland County. However, only three species are present at Fort Jackson: the Rough-leaved Loosestrife, Smooth Coneflower, and the Red-cockaded Woodpecker. None of these species have been identified within the cantonment area.

Additionally, groundwater is generally plentiful at Fort Jackson. The Tuscaloosa Formation, of Upper Cretaceous age, underlies Fort Jackson and is the primary source of groundwater in the area. The Tuscaloosa Formation is at the surface over most of Fort Jackson. Groundwater in the Fort Jackson area is suitable for human consumption; water quality is considered excellent. However, according to a 2003 Phase II RFI report, groundwater is not used as a potable water source at Fort Jackson. Potable water is provided to Fort Jackson by the City of Columbia.

The following discussion pertains to Fort Jackson's cultural resources. According to the INRMP, Fort Jackson has completed a number of cultural resource surveys inventorying and documenting archaeological and historical resources. About 81% of Fort Jackson has been surveyed for archaeological resources. Known NRHP eligible or potentially eligible archaeological sites have occurred in fairly discrete clusters. Remaining portions of Fort Jackson that have not been examined are located in the main cantonment area and impact areas in outlying portions of the installation. The un-surveyed portion of the main cantonment area is expected to contain archaeological resource sites, some of which may be eligible for the NRHP. However, a letter from the South Carolina State Historic Preservation Office indicated that disturbed portions of the main cantonment area do not require survey (Cantonment Area, Fort Jackson, Richland County, South Carolina, letter from the State Historic Preservation Office dated December 15, 1993).

A total of 662 archaeological sites had been identified within Fort Jackson. Most have been preliminarily determined to be ineligible for the NRHP. With exception of the 11 cemeteries recorded as archaeological sites, these resources require no further management consideration. Twelve sites are considered eligible for the NRHP. NRHP-eligible resources must be preserved in place or subjected to appropriate data recovery investigations to prevent the loss of the significant information that is present. The remaining 96 sites have been determined to be potentially eligible for the NRHP. These sites contain components of the different cultural periods identified at Fort Jackson. These resources must be preserved in place until their eligibility for listing has been determined.

Numerous surveys have reviewed the historic qualities of the 1,700 structures at Fort Jackson, most of which have been built in the last 35 years. A review of all existing and demolished structures and all previous historic structure surveys concluded that only three structures were recommended as eligible for listing in the NRHP. One of these structures was subsequently mitigated and demolished. Remaining properties exhibited little integrity and are not considered NRHP-eligible (Panamerican Consultants, Inc., 1997).

Cemeteries are associated with families, churches, or communities that were present on installation lands prior to their acquisition by the Army. Cemeteries on Fort Jackson are enclosed by fences and maintained by the Army. None of Fort Jackson's cemeteries are considered eligible for NRHP inclusion, but all are protected. For management purposes, all cemeteries are treated in the same manner as NRHP-eligible cultural resources.

Fort Jackson has no properties listed on the NRHP, no identified access routes to or sites of religious or ceremonial rites of American Indians, no properties listed as National Historic Landmarks, and no properties listed on the World Heritage List. There may be properties potentially eligible for listing on the NRHP. There are 12 archaeological sites eligible for listing on the NRHP and 96 that are potentially eligible. Two structures remain eligible for the NRHP.

5.1.3.7 Demographics

Based on figures from the 2000 U.S. Census, the population of Richland County (in 2000) was 320,677. The population of the City of Columbia, Richland's largest city, was 116,278. With respect to Fort Jackson, soldiers, civilians, retirees, and family members make up the Fort Jackson community, which continues to grow. The installation instructs an average of 35,000 soldiers in basic and advanced training each year. An additional 19,000 attend courses at the Soldier Support Institute, Chaplain Center & School, and Drill Sergeant School. Fort Jackson employs 3,900 civilians and provides services for more than 100,000 retirees and their family members.

5.1.4 Ecological Profile

5.1.4.1 Habitat Type

According to the INRMP, forest cover is the principal vegetative type on Fort Jackson. The forest types are described in Section 5.1.2.7. Forest management has the most impact on wildlife management on Fort Jackson. Silvicultural treatments modify the landscape and associated wildlife habitats. To ensure silvicultural practices are performed in a manner that positively affects wildlife, all prescriptions are forwarded through the Wildlife Office for

review and comment. Most prescriptions result in beneficial impacts to many wildlife species, but some species may be negatively impacted by the operations in the short term. The only featured species designated for forested habitats is the Red-cockaded Woodpecker.

5.1.4.2 Degree of Disturbance

Disturbance of flora and fauna within the former ranges of the cantonment area is expected to be low to moderate during annual timber harvests.

5.1.4.3 Ecological Receptors

According to the June 2000 ICRMP, compiled by Mr. Jack Wynn (Heritage Program Manager for the Chattahoochee-Oconee National Forests) and Mr. Michael Harmon (Assistant Forest Archaeologist for the National Forests in North Carolina), only one federally listed endangered animal species exists on Fort Jackson: the Red-cockaded Woodpecker (*Piciodes borealis*). The bird nests in aging (greater than 70 year old) pines, lives in family groups or clans, and inhabits park-like territories or clusters of 1,500 radii. There are about 13 active clusters and 39 inactive ones on the installation. This population is routinely monitored, and the surrounding forest managed to encourage the survival of the groups. None of the bird nests or clusters are within the cantonment area ranges discussed in this section.

There are four candidate species for listing as threatened or endangered. They are Southeastern myotis (*Myotiss austroriparius*), Rafinesques's big-eared bat (*Plecotus rrafinequii*), Loggerhead shrike (*Lanius Ludovicianus*), and Bachman's sparrow (*Aimphila aestivalis*). They may be listed later if their populations drop. There are also two federally endangered plant species, rough-leaved loosestrife (*Lysimachia asperulaefolia*) and smooth coneflower (*Echnata laevigata*). Two candidate plants for listing are also found on the installation. They are the crested fringed orchid (*Pteroglossaspis ecristata*) and Piedmont milfoil (*Myriophyllulm laxum*). Endangered species monitoring plans have been prepared for listed species and are consulted prior to any activities that might cause disruptions.

According to the INRMP, the rough-leaved loosestrife is found on the eastern edge of the East (artillery) Impact Area. The smooth coneflower has been documented adjacent to Statue of Liberty Road in Training Area 29B. Neither of the endangered plant species is located within the cantonment area.

5.1.5 Munitions/Release Profile

5.1.5.1 Munitions Types and Release Mechanisms

Table 5-2 presents a summary of the types of munitions that were either identified during the limited visual survey or are expected to exist at the former cantonment area ranges based on information collected for this HRR. The mechanisms by which the munitions were released into the environment are also presented in this table. The typical release mechanisms for the former ranges are intentional activities, such as firing into a target area, and unintentional activities, such as rounds fired falling outside the target area or rounds discarded for various reasons at the firing point. It is noted that the majority of the ranges within the cantonment area were generally used for small arms training. Map 5-1, located at the end of Section 5, shows the horizontal extent of MEC for the cantonment area ranges. Only one range, the Live Hand Grenade Court 2, has the potential for MEC. As such, the primary concern for the cantonment ranges would be associated with MC.

Table 5-2: Summary of Potential Munition Types - Cantonment Area

MMRP Site	Potential Munitions	Primary Release Mechanism
Camp Jackson Ranges	.30-/.45-/.50-caliber	Munitions firing, potentially from the following weapons: Springfield Model 1903, M1909 Revolver, M1917 Revolver, Enfield M1917 Rifle, Browning .30 caliber M1917 Machine Gun, M2 .50-caliber Machine Gun
Live Hand Grenade Court 2	Hand grenades: MK 2 Frag, MK II Practice, M26/61 Frag, M30/62 Practice, M48E1 Smoke, M69 Practice, M18 Smoke, M26A2 Frag, M57 Frag, M34 Smoke, M59/58 Frag	Munitions firing (throwing) - hand grenades

MMRP Site	Potential Munitions	Primary Release Mechanism
Small Arms Ranges East of Chesnut Road	.22-/.30-/.45- caliber	Munitions firing, potentially from the following guns: Springfield Model 1903, M1909 Revolver, M1917 Revolver Enfield M1917 Rifle, M-1 Garand Rifle, M-1 Carbine, M1911 and M19111A1 Pistol

5.1.5.2 Maximum Probable Penetration Depth

The ranges located south of Hartsville Guards Road (the Camp Jackson Ranges, Live Hand Grenade Court 2, and Small Arms Ranges East of Chesnut Road) consist of nine small arms ranges and one hand grenade range. Small arms and hand grenades do not have an associated penetration depth. These and other MC components (such as spent shell casings and residual black or smokeless powder constituents) are expected to have been directly deposited on the soils surface.

5.1.5.3 MEC Density

MEC presence in the ranges located south of Hartsville Guards Road, with the exception of the Live Hand Grenade Court 2, is not anticipated because these ranges were used for small arms training. There is potential for MEC presence in the area of the Live Hand Grenade Court 2.

5.1.5.4 MEC Scrap/Fragments

No MEC scrap or fragments were identified at the Live Hand Grenade Court 2; however, a visual reconnaissance of the entire area was not performed for this HRR.

5.1.5.5 Associated Munitions Constituents

As noted in Table 4-10, the MC associated with the cantonment area ranges include the following: black powder (potassium nitrate, sulfur, and charcoal), smokeless powder (nitrocellulose, DNT, dibutylphalate, and diphenylamine), double based propellant (nitrocellulose and nitroglycerin), Pb, Sb, As, Cu, Zn, Fe, Mg, lead styphnate/lead azide, RDX, and WP.

5.1.5.6 Transport Mechanisms / Migration Routes

The primary transport mechanisms identified for the former cantonment area ranges include the following:

Erosion: The majority of the cantonment areas are heavily vegetated. Thunderstorms often cause local flooding during the summer months; therefore, erosion could be a factor in transporting and migrating MC contaminated soil.

Soil Disturbance: Any surface or subsurface soil disturbance can cause both the transport and migration of MEC and MC. Surface and subsurface disturbances can lead to transport and migration of MC from one environmental media to another (soil to surface or groundwater or both) through surface water runoff and erosion. Since there is potential for timber harvesting to occur in some of the cantonment areas, the potential for soil disturbance exists.

Infiltration: Based on the generally sandy soils located within the cantonment area, the potential for MC to migrate from one environmental media to another (surface to subsurface soil to groundwater) through infiltration exists.

5.1.6 Pathway Analysis

5.1.6.1 MEC

A MEC pathway analysis was prepared for the Live Hand Grenade Court No. 2 (Figure 5-1). The Live Hand Grenade Court No. 2 is located east of Chesnut Road within the southwestern portion of the Transition Range. Since there is no penetration depth associated with hand grenades, MEC in the subsurface is not anticipated. The primary exposure pathway for human and ecological receptors is handle/tread underfoot of surface MEC. The potential for complete pathways exists between surface MEC and all receptors for the Live Hand Grenade Court No. 2.

5.1.6.2 MC

Due to the numerous ranges located within the cantonment area, similar ranges were grouped together to minimize the number of MC pathway analyses models. A pathway analysis figure was created for the Live Hand Grenade Court 2, Camp Jackson Ranges, and the Small Arms Ranges East of Chestnut Road. In summary, the following MC pathway analyses were prepared:

- Live Hand Grenade Court 2 (Figure 5-2)
- Camp Jackson Ranges - 1000-Yard, 600-Yard, 300-Yard, Machine Gun, and Pistol Ranges (Figure 5-3)
- Small Arms Ranges East of Chesnut Road – Transition Range, 1000-Inch Range Nos. 14, 15, 16, Pistol NR 2, and Landscape Target Ranges (Figure 5-4)

The three MC pathway analyses for the cantonment area ranges each show a potentially complete pathway for biota for the vegetation exposure route. Biota is the only receptor expected to ingest vegetation at the sites. Crops are not grown, and domestic animals are not raised on these sites. Biota has potentially complete pathways for contact with MC impacted vegetation. All other pathways for vegetation in the food chain are expected to be incomplete.

The pathways between game/fish/prey and authorized installation personnel, contractors, and visitors are incomplete because hunting is not permitted in the cantonment area and there are no water bodies overlapped by any HRR-identified ranges. Biota has potentially complete pathways through the potential ingestion of prey that may have fed on contaminated vegetation in these areas.

Potentially complete pathways for ingestion and dermal contact exist between surface water/sediment and all receptors at these sites because there is potential for erosion to enable the migration of MC to the water bodies located at the southern portion of the cantonment area; Heises Pond and Twin Lakes.

The groundwater exposure routes are expected to be potentially complete pathways for all potential receptors since there is an active water supply well located south of Semmes Road in the southern portion of the cantonment area. However, the City of Columbia supplies Fort Jackson with potable water.

Potentially complete pathways for all exposure routes for both surface and subsurface soil exist for all receptors. Since access to and activities in these areas are not restricted, the potential for soil disturbance to occur exists. Also, the subsurface pathways would be potentially complete for biota because they may nest or burrow in these areas.

Figure 5-1: MEC Exposure Pathway Analysis - Live Hand Grenade Court 2

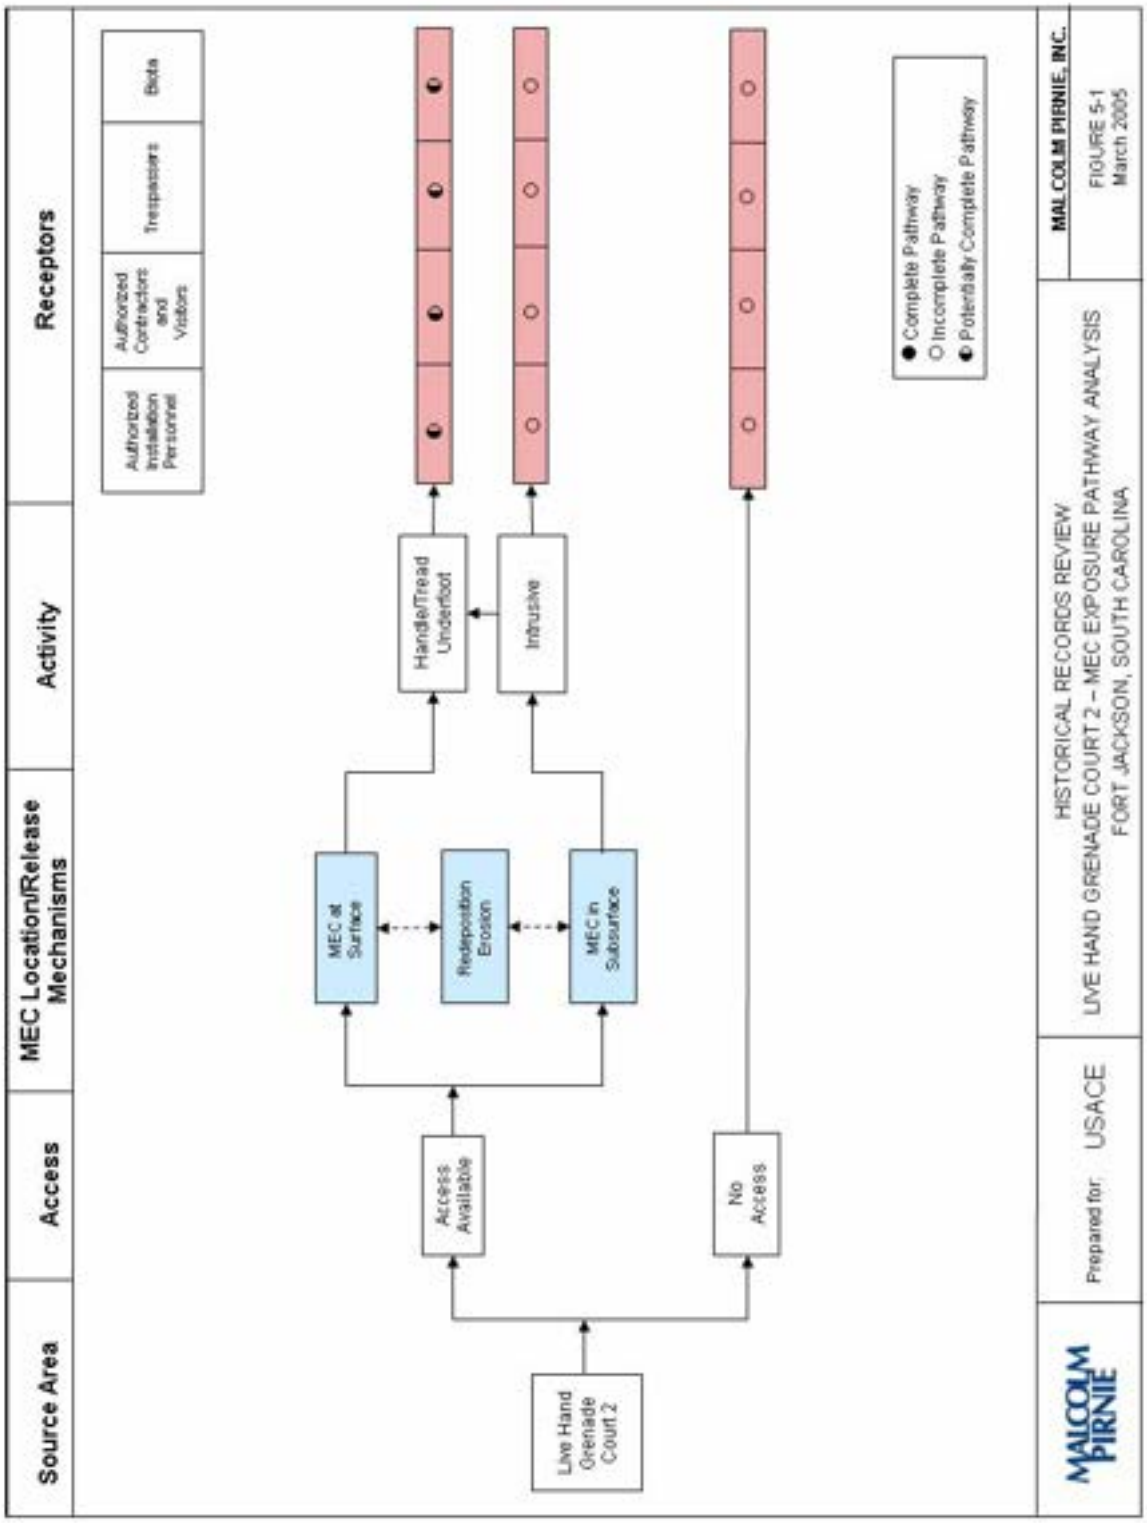

Figure 5-2: MC Exposure Pathway Analysis - Live Hand Grenade Court 2

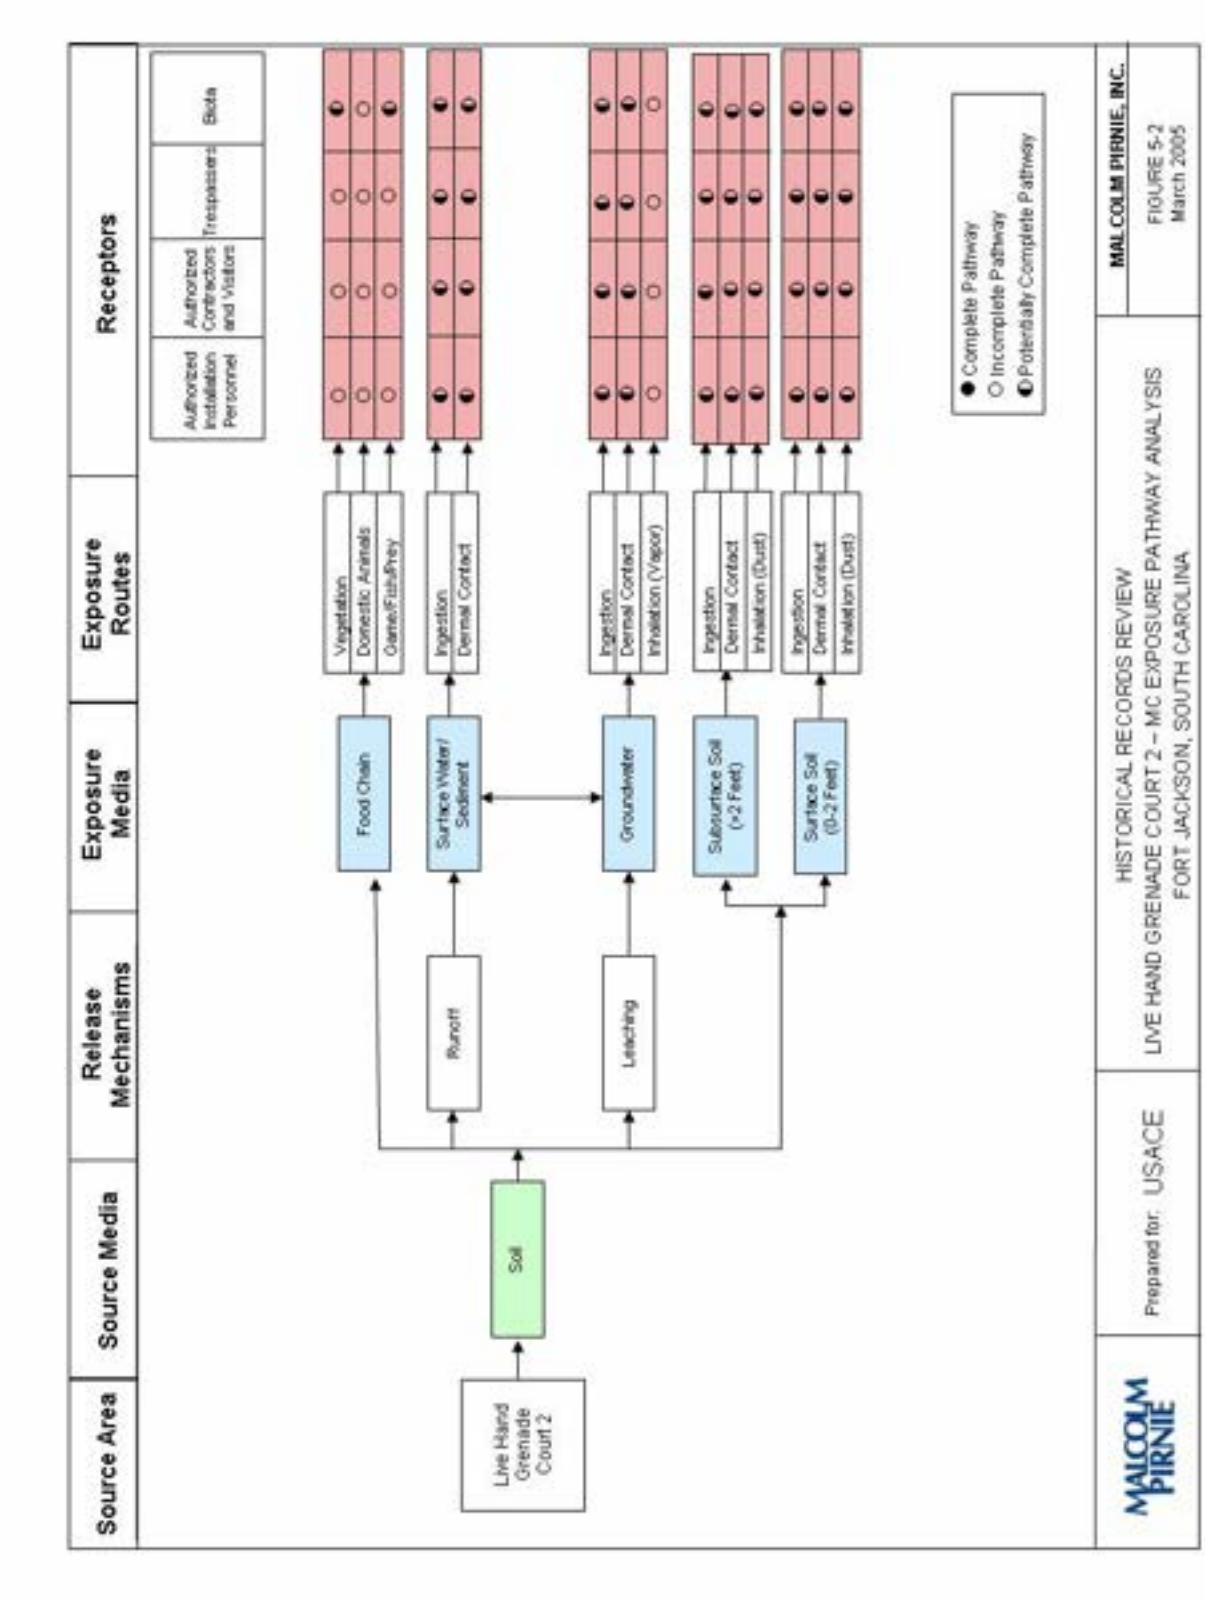

Figure 5-3: MC Exposure Pathway Analysis – Camp Jackson Ranges

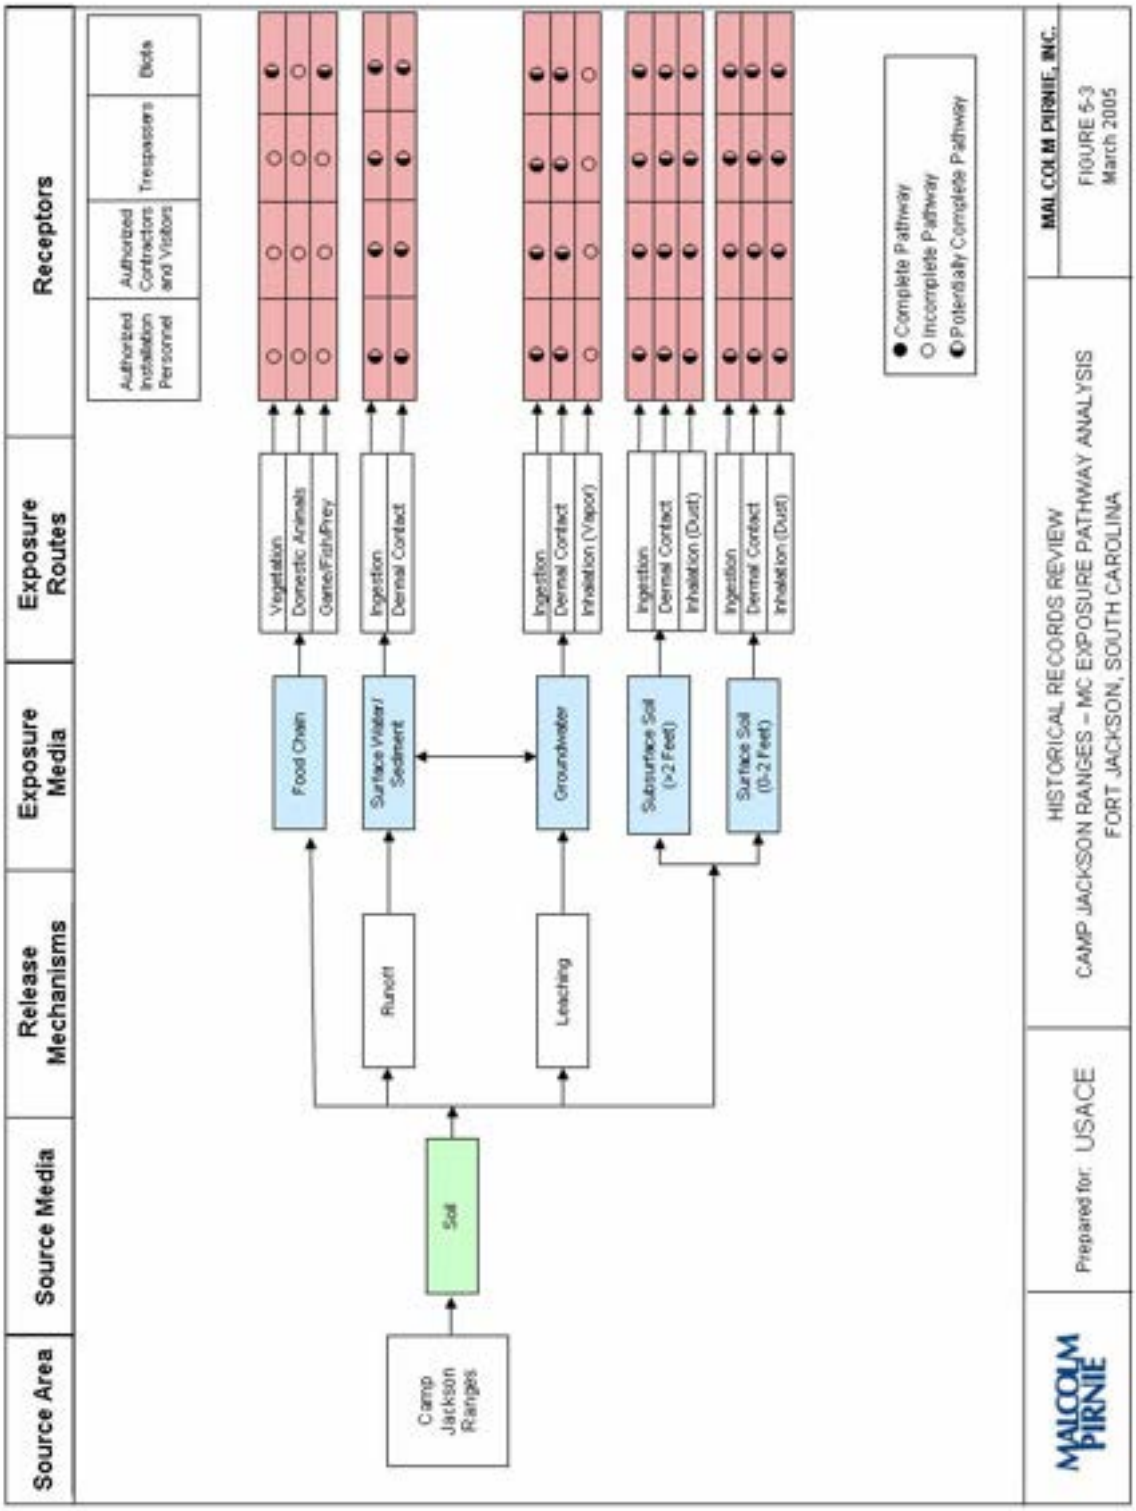

Figure 5-4: MC Exposure Pathway Analysis - Small Arms East of Chesnut Road

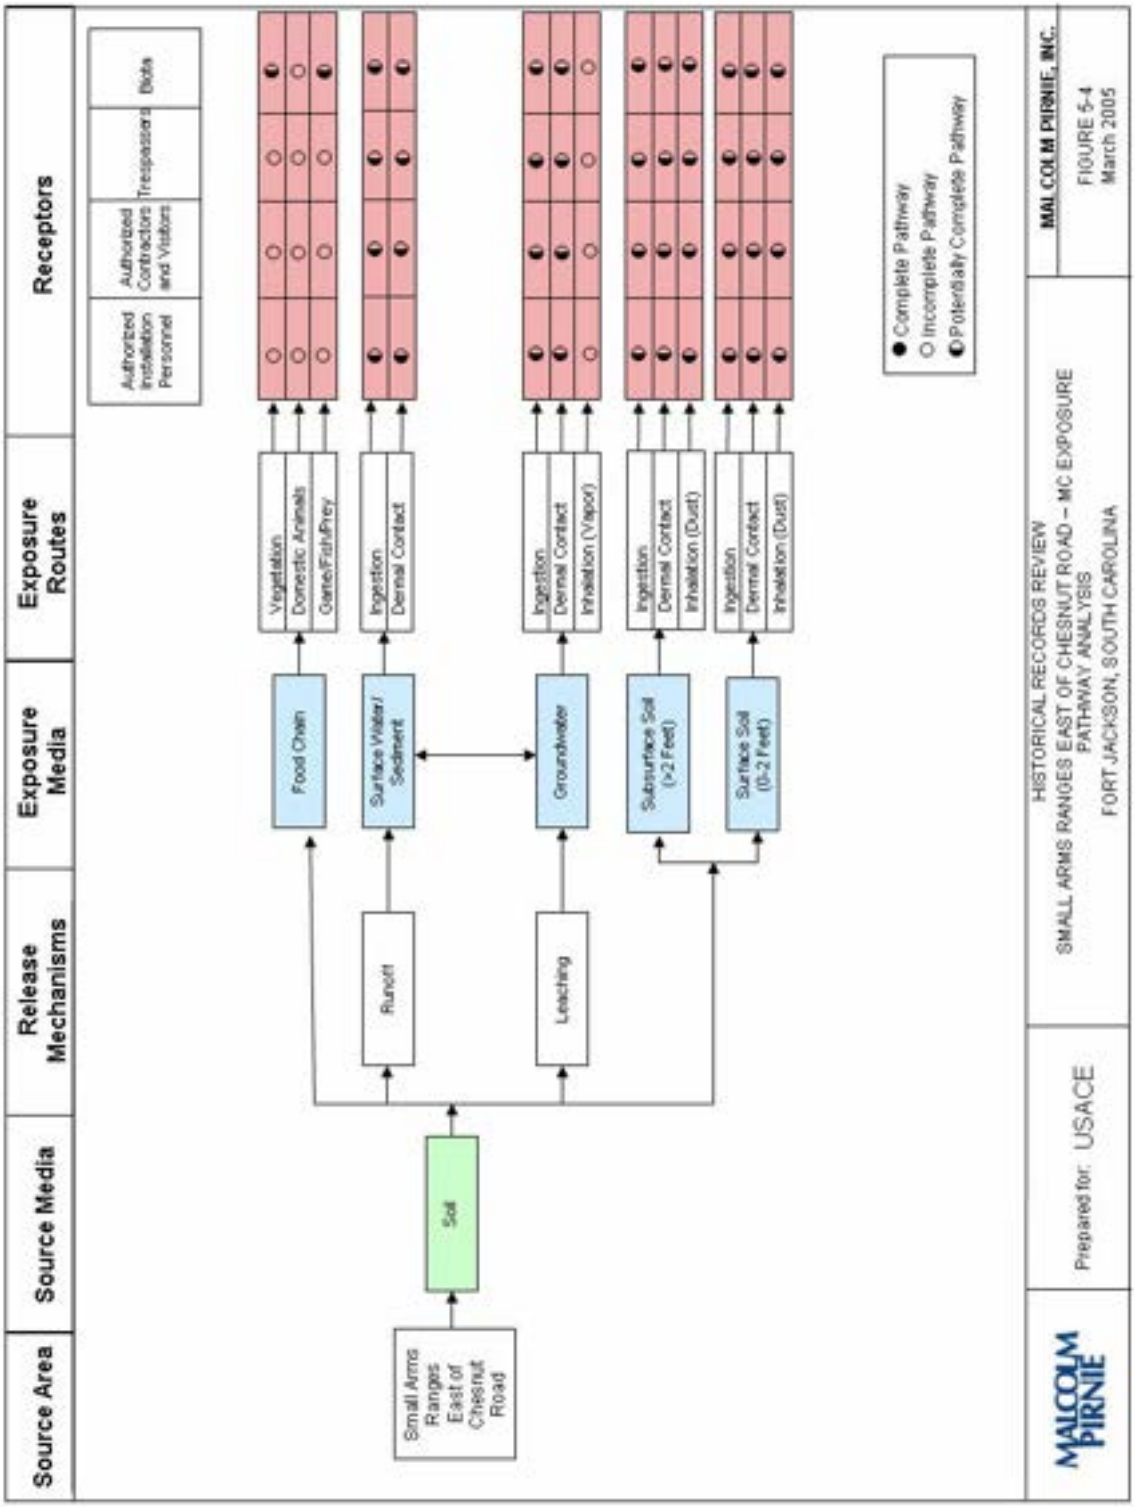

5.2 FORT JACKSON FLIGHT CLUB

5.2.1 MMRP Site Profile

5.2.1.1 Area and Layout

The FJFC is an approximately 54-acre area located east of Wildcat Road just north of Dixie Road, near the northwestern portion of the installation. The FJFC is quasi-rectangular in shape with a wider base than top. The westernmost portion of the FJFC did not have a historical range use. As such, the MMRP site acreage for the FJFC is 42 acres. This area has been divided into two MMRP sites: FJFC Salerno Ranges (which includes 15 acres that had MEC use) and FJFC Small Arms Ranges (which includes 27 acres).

5.2.1.2 Structures

The FJFC area contains a flat, clear, and level area surrounded by forest and grassland. The flat cleared portion of the site has been used by the Fort Jackson model airplane club as an airstrip for small recreational type R/C model aircraft. The improvements to the site include a level area for use as an airstrip, a gravel parking area, sun shelter and bleachers for spectators, a covered picnic area, and a storage building for maintenance equipment. No other structures are associated with this site.

5.2.1.3 Utilities

The only utilities associated with this area are electric lines running to street security lights.

5.2.1.4 Boundaries

The FJFC is bounded to the north and east by forest and grassland, to the south by Dixie Road, and to the west by Wildcat Road.

5.2.1.5 Security

The FJFC area is located within the boundaries of the Fort Jackson installation. Access to the installation is limited by gates and/or roadblocks on all roads leading into the installation.

Access to the installation is restricted to Army personnel, authorized civilian personnel, contractors and visitors. Security personnel routinely patrol the FJFC area by vehicle. The FJFC does not have separate fencing.

5.2.2 Physical Profile

5.2.2.1 Climate

Climate is general installation information and is presented in Section 5.1.2.1.

5.2.2.2 Geology

Geology is general installation information and is presented in Section 5.1.2.2. No specific geologic information for FJFC was available.

5.2.2.3 Topography

The FJFC is located at an elevation of approximately 400 feet above mean sea level. Topography within the FJFC is generally flat and slopes towards the east.

5.2.2.4 Soil

According to Figure 3.2.4 - Fort Jackson soils contained in the INRMP, the soil type located within the FJFC consists of Lakeland sand. Lakeland sand is a deep, excessively drained gentle sloping soil on convex ridge tops in the Sand Hills. The surface layer (three inches) consists of dark gray sand; the subsurface (107 inches) consists of yellow or brown sand. It has medium potential for urban development, primarily due to low water capacity. Lakeland sand is a predominant soil type found at Fort Jackson.

5.2.2.5 Hydrogeology

Hydrogeology is general installation information and is presented in Section 5.1.2.5.

5.2.2.6 Hydrology

Hydrology is general installation information and is presented in Section 5.1.2.6.

5.2.2.7 Vegetation

According to Figure 3.3.1.1 - Forest Types of Fort Jackson contained in the INRMP, the predominant forest types located within the FJFC are natural pine and scrub oak.

5.2.3 Land Use and Exposure Profile

5.2.3.1 Current Land Use

The flat cleared portion of the site has been used by the FJFC as an airstrip for R/C model aircraft since the late 1980s. There is a picnic area associated with the flying field.

5.2.3.2 Current Human Receptors

Current potential receptors of any MEC or MC present on the former FJFC include R/C aircraft operators (authorized visitors), authorized Fort Jackson personnel, authorized contractors, and trespassers.

5.2.3.3 Current Land Uses/Activities

Current activities include those associated with R/C aircraft recreational operations. Also, routine maintenance is performed on the airstrip, picnic, and spectator areas. Much of the FJFC area is undeveloped.

5.2.3.4 Potential Future Land Use

No changes to the current land use are planned for this area. Fort Jackson may increase the size of maintained area for the benefit of the FJFC.

5.2.3.5 Potential Future Human Receptors

The future human receptors are expected to remain the same as the current human receptors. There is no anticipated change in future site usage.

5.2.3.6 Zoning/Land Use Restrictions

No zoning or land use restrictions have been identified for this site.

5.2.3.7 Beneficial Resources

Beneficial factors for the Fort Jackson installation have been identified in Section 5.1.3.6. Additionally, slash pine has been planted in the former target/downrange hazard area. The slash pine, when mature, will provide beneficial habitat for the Red-cockaded Woodpecker, as well as a beneficial timber product.

5.2.3.8 Demographics

The demographics for the area of the installation are presented in Section 5.1.3.7.

5.2.4 Ecological Profile

5.2.4.1 Habitat Type

The habitat types are similar across the installation and are described in Section 5.1.4.1. Forest cover is the principal vegetative type on Fort Jackson. The primary forest cover type within the FJFC is slash pine and scrub oak; therefore, the habitat type would only be for small mammals (e.g., mice squirrels) and birds. The FJFC site contains maintained grass, sandy areas, and some planted slash pine forest that could provide a habitat for the Red-cockaded Woodpecker.

5.2.4.2 Degree of Disturbance

Minimal to moderate disturbance of flora and fauna species located in the FJFC area is expected due to the operation of R/C model aircraft and routine site maintenance.

5.2.4.3 Ecological Receptors

Potential rare, threatened, or endangered species and species of interest near and on Fort Jackson are discussed in Section 5.1.4.3. It is not likely that any of the species discussed in Section 5.1.4.3 would currently be found in the immediate area of the FJFC. However, it is possible that the slash pine forest will provide a future habitat for the Red-cockaded Woodpecker.

5.2.5 Munitions/Release Profile

5.2.5.1 Munitions Types and Release Mechanisms

Table 5-2 presents a summary of the types of munitions that would be expected based on information collected for this HRR. The mechanisms by which the munitions were released into the environment are also presented in this table. The typical release mechanisms for the former FJFC ranges are intentional activities, such as firing into a target area, and unintentional activities, such as rounds fired falling outside the target area or rounds discarded for various reasons at the firing point.

Table 5-3: Summary of Potential Munitions Types – FJFC

MMRP Site	Potential Munitions	Primary Release Mechanism
FJFC Salerno Ranges	40-mm grenades, Rocket grenades, 66-mm rockets, 35-mm sub-caliber rockets, 3.5-in rockets, M18A1 Anti-Personnel Mine, Practice grenades	Munitions firing, potentially from the following weapons: M79 Grenade Launcher M72 LAW 3.5-in Rocket Launcher M18A1 Anti-Personnel Mine
FJFC Small Arms Ranges	.30-/.50-caliber, 7.62-mm, 5.56-mm	Munitions firing, potentially from the following weapons: Browning .30 M1917 Machine Gun M2 .50 Machine Gun M-60 Machine Gun Springfield Model 1903 Enfield M1917 Rifle M-1 Garand Rifle M-1 Carbine

5.2.5.2 Maximum Probability Penetration Depth

MEC that may be present at the FJFC Salerno Ranges site include 66-mm LAW rockets and 40-mm rifle grenades. The expected depth of penetration in sand for the 66-mm rocket is 10.8 inches below ground surface (bgs), and the expected depth of penetration in sand for the 40-mm grenade is 2.4 inches bgs.

Small arms and hand grenades do not have an associated penetration depth. These and other MC components (such as spent shell casings and residual black powder components and wastes) are expected to have been directly deposited on the ground surface.

5.2.5.3 MEC Density

The greatest density of MEC is expected to be located in the northeast corner of the FJFC Salerno Ranges, since this area is most likely where the Salerno Demonstration M79 rifle grenade range and M72 LAW rocket launcher firing lines were located. The range for the 40-mm grenade was approximately 50 to 400 meters; therefore, the impact zone of the M79 rifle grenade range is within the current borders of the FJFC Salerno Ranges site. The effective range for the M72 LAW rocket is 170 to 220 meters, and its maximum range is 1000 meters; therefore, the impact zone of the M72 LAW is also expected to fall within the FJFC Salerno Ranges site.

5.2.5.4 MEC Scrap/Fragments

The majority of the MEC scrap/fragments are expected to have been deposited as a result of activities associated with the Salerno Demonstration Range, specifically, the M72 and M79 ranges. During the visual survey conducted at the FJFC on June 17, 2004, MEC including 40-mm grenades and 35-mm sub-caliber rockets were observed at the FJFC Salerno Ranges site.

5.2.5.5 Associated Munitions Constituents

As noted in Table 4-2, MC associated with the ranges formerly overlapping the FJFC include black powder (potassium nitrate, sulfur, and charcoal), smokeless powder (nitrocellulose, DNT, dibutylphalate, and diphenylamine), double based propellant (nitrocellulose and nitroglycerin), Pb, Sb, As, Cu, Sn, Zn, Fe, Sr, Mg, and lead styphnate/lead azide. No soil or groundwater samples have been analyzed for explosives within the FJFC; therefore, it is not known whether explosives are present at the FJFC site.

The primary MC of concern associated with the FJFC Small Arms Ranges is Pb. Other MC of concern that may be included in trace amounts are: Sb and Sn, which increase the hardness of bullets; As present in Pb; Cu present in the bullet core alloy; Cu and Zn present in the jacket alloy; Fe from the tips of penetrator rounds; Cu, Zn, Sr, and Mg present in tracer munitions; and lead styphnate/lead azide in the primer mixture.

5.2.5.6 Transport Mechanisms / Migration Routes

The primary transport mechanisms identified for the FJFC site include the following:

Erosion: Since thunderstorms are common during the summer months, erosion could be a factor in exposing buried MEC and in transporting and migrating MC contaminated soil to surface water bodies. Since the topography at the FJFC slopes to the east, it is expected that erosional migration of MEC and/or MC would be in the down slope direction.

Soil Disturbance: Surface and subsurface disturbances can lead to transport and migration of MC from one environmental media to another (soil to surface or groundwater or both) through surface water runoff and erosion. Known soil disturbance activities at the FJFC include land clearing and pine tree planting.

Infiltration: Since much of the FJFC is composed of sand, the potential for MC to migrate from one environmental media to another (surface to subsurface soil to groundwater) through infiltration exists.

5.2.6 Pathway Analysis

5.2.6.1 MEC

The MEC pathway analysis was prepared for the FJFC Salerno Ranges (Figure 5-5). The primary exposure pathway for human and ecological receptors is handle/tread underfoot of surface MEC. The potential for complete pathways exist between surface MEC and all receptors. The potential for complete pathways exist between subsurface MEC and

authorized installation personnel, contractors, and biota. Timber harvesting/planting in this area could lead to contact with subsurface MEC, and biota may nest or burrow in this area causing potential contact with subsurface MEC, as well.

5.2.6.2 MC

MC pathway analyses were prepared for the FJFC Salerno Ranges (Figure 5-6) and the FJFC Small Arms Ranges (Figure 5-7). These MC pathway analyses show a potentially complete pathway for biota for the vegetation exposure route. Biota is expected to ingest vegetation at the site and have a potentially complete pathway for vegetation in the food chain. All other pathways for vegetation in the food chain are expected to be incomplete. Crops are not grown on the site, and domestic animals are not raised on the site; therefore, no complete pathways exist for this exposure route. A potentially complete pathway through the game/fish prey exposure route exists only for biota.

Potentially complete pathways for ingestion and dermal contact exist between surface water/sediment and all receptors expected at the site. The groundwater exposure routes are expected to be potentially complete pathways for all potential receptors since there is an active water supply well located in close proximity to the FJFC.

Potentially complete pathways for all exposure routes for both surface and subsurface soil exist for all receptors. Since access and activities at the FJFC are not restricted, the potential for soil disturbance to occur exists. The subsurface pathway would also be potentially complete for biota because they may nest or burrow at the site.

Figure 5-5: MEC Exposure Pathway Analysis – FJFC Salerno Ranges

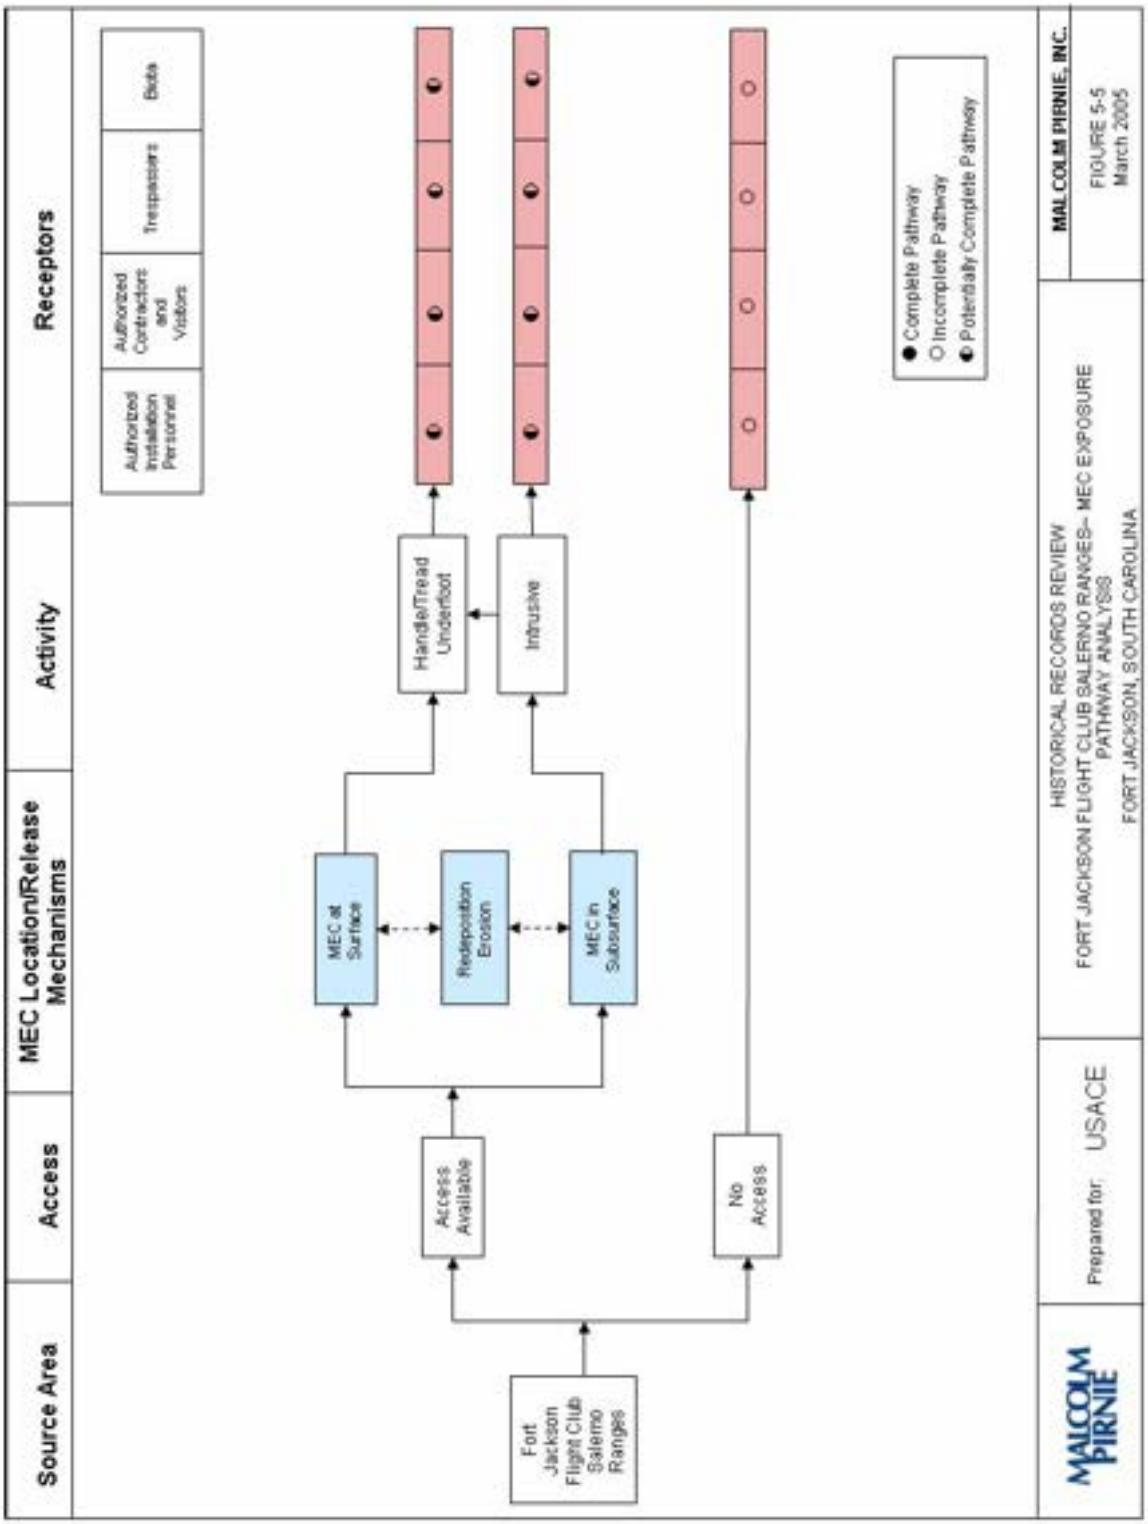

Figure 5-6: MC Exposure Pathway Analysis – FJFC Salerno Ranges

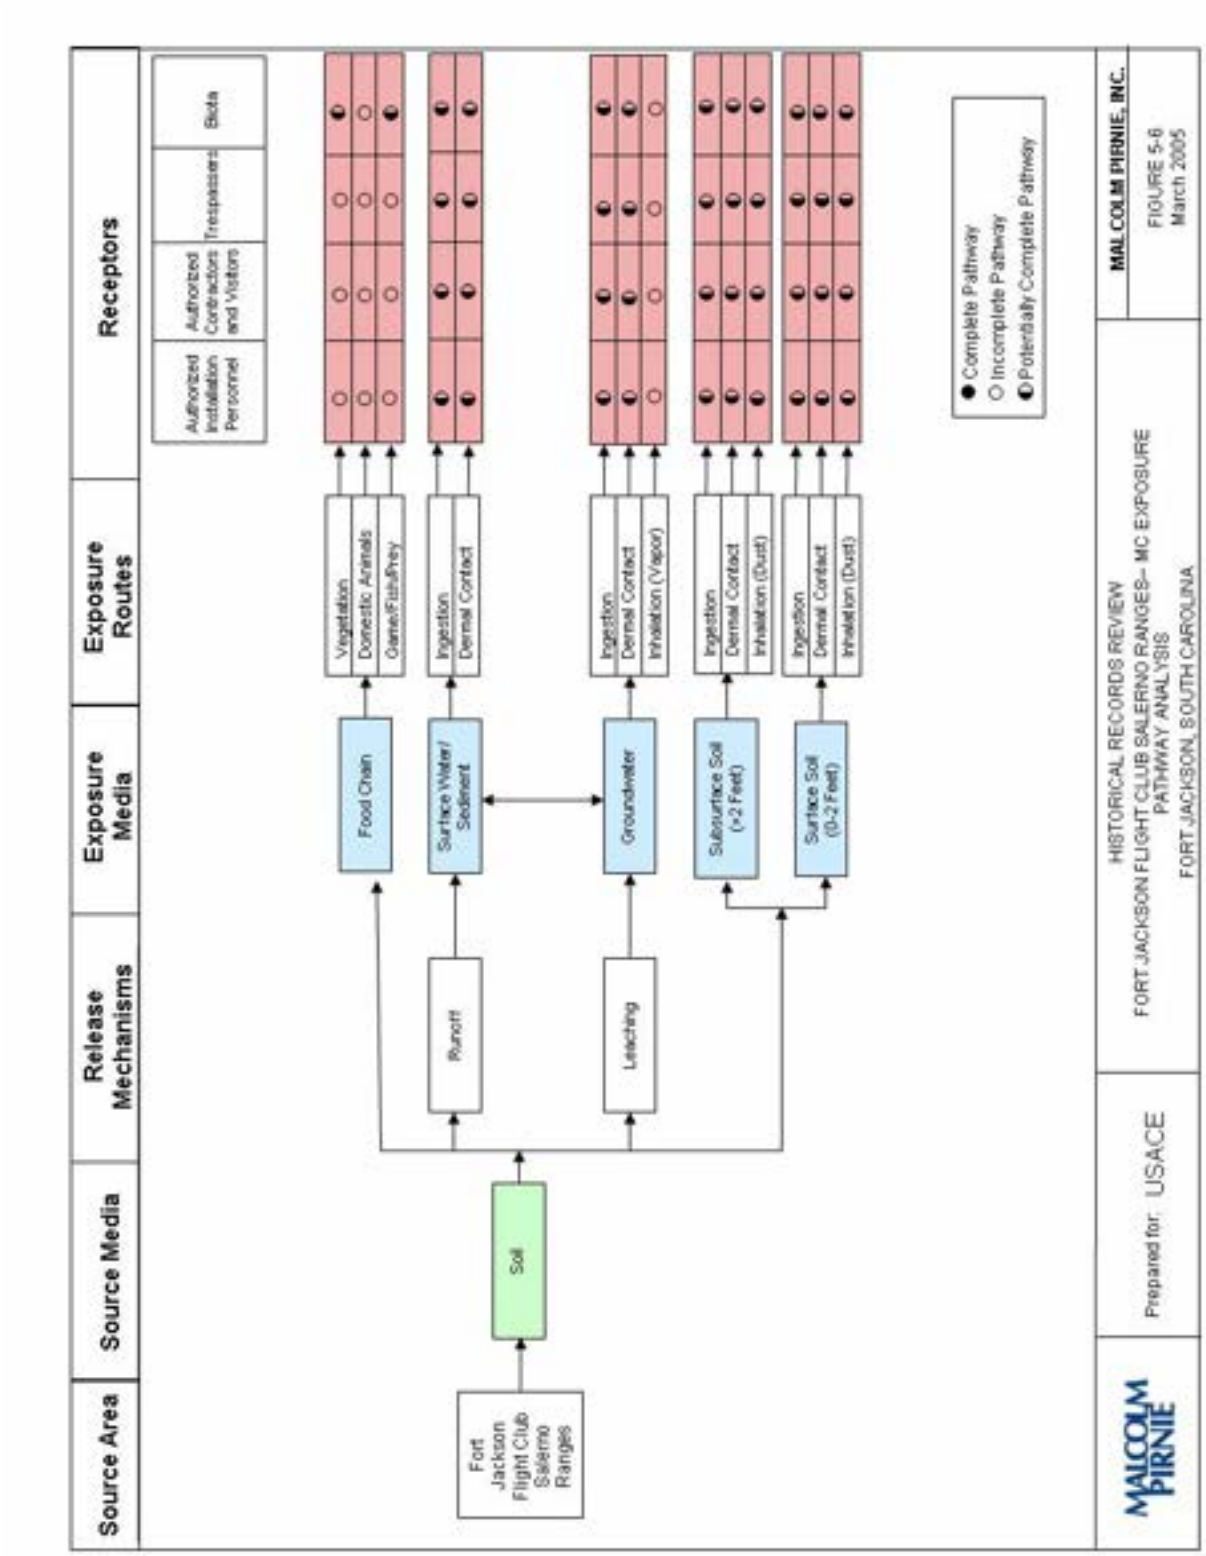

Figure 5-7: MC Exposure Pathway Analysis – FJFC Small Arms Ranges

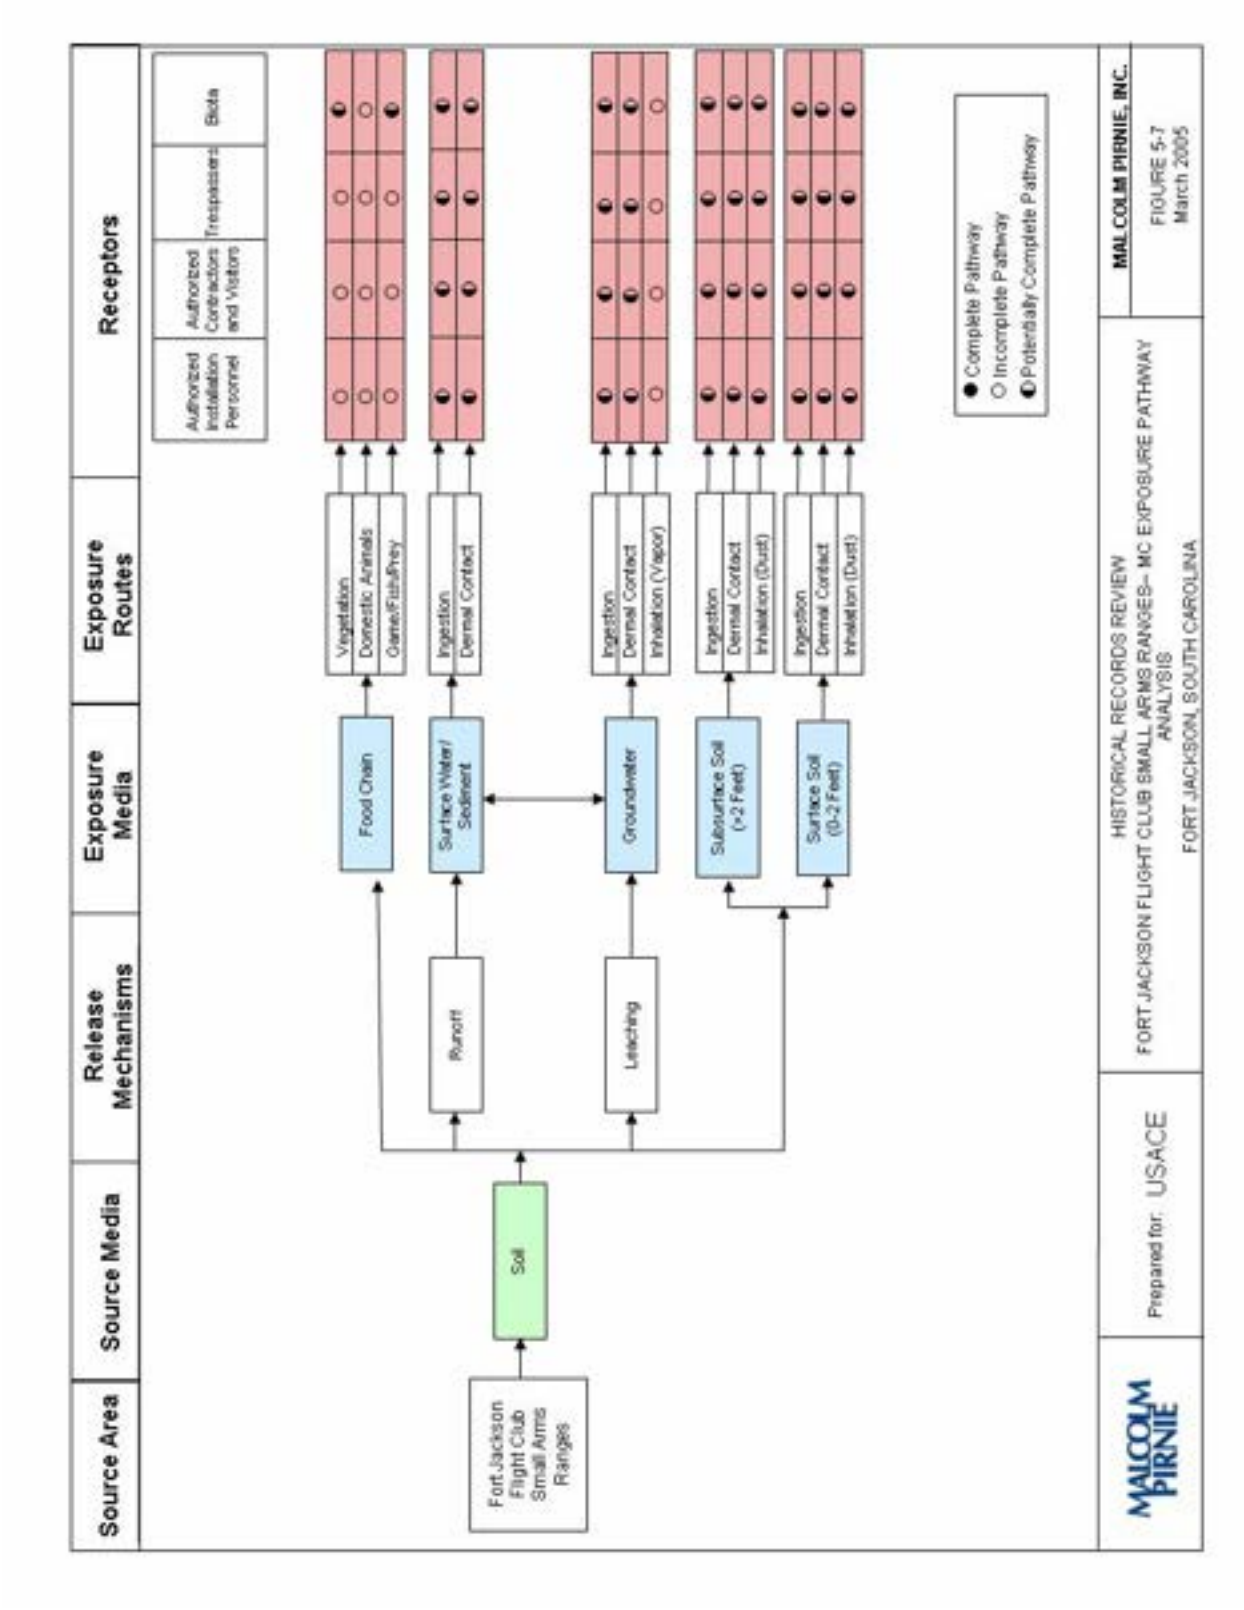

5.3 WESTON LAKE AREA RANGES/SITES

5.3.1 MMRP Site Profile

5.3.1.1 Area and Layout

The Weston Lake Area is located on the southern, central portion of the installation. A total of two sites are located in this area. Geographical features of these sites are briefly described below:

- The Mortar Range (more specifically Mortar Range 5A, 7, and 8 Safety Fans) consists of a 306-acre area that is located in the northern section of the Weston Lake Area. The other than operational portion of the Mortar Range is somewhat trapezoidal in shape and includes the portion of the Submachine Gun Area that is overlapped by the Mortar Range.

- The Submachine Gun Area (more specifically the Dismounted and Moving Vehicle Submachine Gun Area) consists of an approximate 17-acre area located on the northern portion of the Weston Lake Area. The other than operational portion of the Submachine Gun Area is somewhat trapezoidal in shape. The 17-acre area includes only the portion of the Submachine Gun Area not overlapped by the Mortar Range.

5.3.1.2 Structures

The Mortar Range is located about 1/4 mile north of the main recreation facilities of the Weston Lake Area; however, it has not been directly improved by recreational facilities (e.g., camp sites or trails). There are no structures located at the Mortar Range. Portions of the Dismounted Submachine Gun No. 1 Range, the Moving Vehicle Submachine Gun Range, and the Dismounted Submachine Gun No. 2 Range extend across the eastern half of the Mortar Range.

The Submachine Gun Area primarily includes the firing points and target areas of the Dismounted Submachine Gun No. 1 Range. This area has been developed for recreational purposes and currently includes a picnic area, rental cabins, and a small boat launch area.

5.3.1.3 Utilities

There are no utilities located on the Mortar Range. However, the Submachine Gun Area has both overhead and buried utilities for the recreational area.

5.3.1.4 Boundaries

The Mortar Range is bounded to the north, west and east by undeveloped land and to the south by Weston Lake Area.

The Submachine Gun Area is bounded to the north and west by Weston Lake. Recreational facilities are located to the south and east.

5.3.1.5 Security

The Weston Lake Area is located within the boundaries of the Fort Jackson installation. Access to the installation is limited by gates and/or roadblocks on all roads leading into the installation. Access to the installation is restricted to Army personnel, authorized civilian personnel, contractors, and visitors. The Weston Lake Area MMRP sites are located within the Weston Lake Area. The individual sites within the Weston Lake Area are not fenced. However, the Mortar Range has not been directly improved with recreational facilities (e.g., camp sites, trails) and is in a remote location not easily accessible by visitors using the Weston Lake Area. Recreational facilities have been constructed at the Submachine Gun Area.

5.3.2 Physical Profile

5.3.2.1 Climate

Climate is general installation information and is presented in Section 5.1.2.1.

5.3.2.2 Geology

Geology is general installation information and is presented in Section 5.1.2.2.

5.3.2.3 Topography

General topographical information on the installation is given in Section 5.1.2.3.

5.3.2.4 Soil

General soil information for the Fort Jackson Installation is given in Section 5.1.2.4. According to Figure 3.2.4 - Fort Jackson Soils contained in the INRMP, the soil types located within the Mortar Range and Submachine Gun Area consist of Lakeland, Ailey, and Vauclose soils.

5.3.2.5 Hydrogeology

Hydrogeology is general installation information and is presented in Section 5.1.2.5.

5.3.2.6 Hydrology

Hydrology is general installation information and is presented in Section 5.1.2.6.

5.3.2.7 Vegetation

According to Figure 3.3.1.1 - Forest Types of Fort Jackson contained in the INRMP, the predominant forest type located within the Mortar Range is pine plantation. The Pine Plantation forest type is made up mostly of planted longleaf pine and slash pine (*Pinus elliottii*), which is not native to Fort Jackson.

According to Figure 3.3.1.1 discussed above, the predominant forest type located within the Submachine Gun Area is natural pine and pine hardwood. Natural pine includes all natural pine strands. In pine hardwood stands, hardwoods must constitute 21-49% of the overstory basal area, while the remainder is pine of any species.

5.3.3 Land Use and Exposure Profile

5.3.3.1 Current Land Use

The two Weston Lake Area MMRP sites are located in the Weston Lake Area, which is used by the general public for camping, picnics, and other recreational activities. However, the Mortar Range has not been directly improved with recreational facilities (e.g., camp sites) and is in a remote location not easily accessible by visitors using the Weston Lake Area. Recreational facilities have been constructed at the Submachine Gun Area.

5.3.3.2 Current Human Receptors

Current potential receptors of MEC or MC present on the Weston Lake Area ranges include authorized installation personnel, contractors, and visitors, as well as trespassers.

5.3.3.3 Current Land Uses/Activities

Current activities include recreational activities such as camping, swimming, fishing, biking, and hiking. However, the Mortar Range is in a remote location not easily accessible or frequented by visitors using the Weston Lake Area.

5.3.3.4 Potential Future Land Use

No changes to the current land use are planned for this area.

5.3.3.5 Potential Future Human Receptors

The future human receptors are expected to remain the same as the current human receptors. There is no anticipated change in access to the sites.

5.3.3.6 Zoning/Land Use Restrictions

No zoning or land use restrictions are present for this area.

5.3.3.7 Beneficial Resources

Fort Jackson encompasses a wide variety of vegetative site conditions, ranging from bottomland hardwood communities to xeric longleaf pine communities as noted in Section 5.1.3.6. The most predominant forest types on the ranges located within the Weston Lake Area are natural pine and pine plantation. Timber is harvested annually at Fort Jackson, and these ranges may provide a percentage of the annually harvested timber.

It is noted that the SWMU 12 and SWMU 17 sites are located just east of the Weston Lake Area. Additionally, the Red-cockaded Woodpecker is the only endangered animal species identified on the reservation. The Weston Lake Area includes habitat associated with the Red-cockaded Woodpecker. Informational signs (Figure 5-8) are located throughout the Weston Lake Area cautioning people of the potential presence of this endangered species.

Figure 5-8: Red-cockaded Woodpecker Habitat Sign

5.3.3.8 Demographics

The demographics for the area of the installation are presented in Section 5.1.3.7.

5.3.4 Ecological Profile

5.3.4.1 Habitat Type

The habitat types are general across the installation and are described in Section 5.1.4.1. Forest cover is the principal vegetative type on Fort Jackson. The most predominant forest types on the ranges located within the Weston Lake Area are natural pine and pine plantation; therefore, the habitat type would be for small mammals (e.g., mice and squirrels) and birds.

5.3.4.2 Degree of Disturbance

Disturbance of flora and fauna species located in the Weston Lake Area is expected to be moderate during annual timber harvests.

5.3.4.3 Ecological Receptors

Potential rare, threatened, or endangered species and species of interest near and on the Fort Jackson installation are discussed in Section 5.1.4.3. As stated previously, the Red-cockaded Woodpecker is the only endangered animal species identified on the reservation. Habitat exists within the Weston Lake Area.

5.3.5 Munitions/Release Profile

5.3.5.1 Munitions Types and Release Mechanisms

Table 5-3 presents a summary of the types of munitions that were either identified during the limited visual survey conducted at the Weston Lake Area sites or that would be expected based on information collected for this HRR. The mechanisms by which the munitions were released into the environment are presented in this table. The typical release mechanisms for the MMRP sites located in the Weston Lake Area include intentional activities, such as firing into a target area, and unintentional activities, such as rounds fired falling outside the target area or rounds discarded for various reasons at the firing point. It is important to note that in areas that were used for small arms training (i.e., the Submachine Gun Area), MEC are not expected, and the primary concern would be associated with MC.

Table 5-4: Summary of Potential Munition Types - Weston Lake Area

MMRP Site	Potential Munitions	Primary Release Mechanism
Mortar Range	60-mm, 81-mm, 3-in, 4.2-in mortar rounds .30-/.45-/.50-caliber, Live and practice grenades	Munitions firing, potentially from the following weapons: 60-mm, 81-mm, 3-in, 4.2-in mortar systems Overlapping Range Fan(s) weapons: M1A1 Thompson, M1928 Thompson, M3 and M3A1 (Grease) Submachine Gun .30-caliber machine gun .50-caliber machine gun M-1 rifle
Submachine Gun Area	.45-caliber	M1A1 Thompson, M1928 Thompson, M3 and M3A1 (Grease) Submachine Gun

5.3.5.2 Maximum Probability Penetration Depth

The expected depths for the various MEC items associated with the Weston Lake Area MMRP sites are presented in Table 5-5. These expected depths include values for sand, loam, and clay and were obtained from EM 1110-1-4009 Ordnance and Explosives Response, prepared by the USACE. These penetration depths are estimated on a worst-case scenario that assumes that the impact is perpendicular to ground surface and that the ordnance item does not deform upon impact. Small arms do not have an associated penetration depth. These and other MC components (such as spent shell casings and residual

black powder components and wastes) are expected to have been directly deposited on the ground surface.

Table 5-5: Summary of Expected MEC Penetration Depths

Ordnance Item/Weapon	Depth of Penetration (inches bgs)		
	Sand	Loam	Clay
60-mm mortar	13.2	18	27.6
81-mm mortar	32.4	42	64.8
4.2-in mortar	49.2	64.8	99.6

5.3.5.3 MEC Density

MEC presence in the Mortar Range, which includes three mortar range safety fans, is unknown. The other than operational area associated with the Mortar Range (i.e., safety fans) is undeveloped. As mentioned previously, five Howitzer range safety fans, two machine gun range safety fans, one rifle range, the Submachine Gun Area, and five unidentified range fans overlap the Mortar Range. Based on the number of overlapping fans, this area has the potential for MEC presence associated the Mortar Range and possibly from other overlapping ranges. However, MEC presence is expected to be minimal since the other than operational area associated with the Mortar Range lies within the safety fans (not within the direct line of fire) of the mortar ranges and overlapping ranges.

5.3.5.4 MEC Scrap/Fragments

During the June 17, 2004 site walk, MEC scrap and fragments were not observed at the Weston Lake Area MMRP Sites.

5.3.5.5 Associated Munitions Constituents

As noted in Table 4-3, MC associated with the Weston Lake Area MMRP sites include the following: black powder (potassium nitrate, sulfur, and charcoal), RDX, WP, illumination mix, smokeless powder (nitrocellulose, DNT, dibutylphalate, and diphenylamine), double

based propellant (nitrocellulose and nitroglycerin), Composition B, TNT, Octol, Pb, Sb, As, Cu, Sn, Zn, Fe, Sr, Mg, and lead styphnate/lead azide.

5.3.5.6 Transport Mechanisms / Migration Routes

The primary transport mechanisms identified for the Weston Lake Area MMRP sites include the following:

Erosion: Since thunderstorms are common during the summer months, erosion could be a factor in exposing buried MEC and in transporting and migrating MC contaminated soil to surface water bodies such as Weston Lake, located south of the Mortar Range/Submachine Gun Area.

Soil Disturbance: Since timber harvesting and recreational activities occur in this area, the potential for soil disturbance to occur exists. Any surface or subsurface soil disturbance can cause both the transport and migration of MEC and MC. Surface and subsurface disturbances can lead to transport and migration of MC from one environmental media to another (soil to surface or groundwater or both) through surface water runoff and erosion.

Infiltration: Based on the generally sandy soils located within the Weston Lake Area, the potential for MC to migrate from one environmental media to another (surface to subsurface soil to groundwater) through infiltration exists.

5.3.6 Pathway Analysis

5.3.6.1 MEC

The MEC pathway analysis was prepared for the Mortar Range (Figure 5-9). The primary exposure pathway for human and ecological receptors is handle/tread underfoot of surface MEC. The potential for complete pathways exists between surface MEC and all receptors. Since there is no penetration depth associated with hand grenades, MEC in the subsurface is not anticipated. The potential for complete pathways exists between subsurface MEC and

authorized installation personnel, contractors, and biota for the Mortar Range. Timber harvesting in this area could lead to contact with subsurface MEC, and biota may nest or burrow in these areas causing potential contact with subsurface MEC, as well.

5.3.6.2 MC

MC pathway analyses were prepared for the Mortar Range (Figure 5-10) and the Submachine Gun Area (Figure 5-11). The MC pathway analyses displayed show potentially complete pathways for biota for the vegetation exposure route. Biota is expected to ingest vegetation at the Weston Lake Area MMRP sites and have potentially complete pathways for vegetation in the food chain. All other pathways for vegetation in the food chain are expected to be incomplete. Crops are not grown on the sites, and domestic animals are not raised on the sites; therefore, no complete pathways exist for this exposure route. All receptors, except contractors, have potentially complete pathways through the game/fish prey exposure route. This is because the Weston Lake Area offers fishing for authorized installation personnel and their visitors.

Potentially complete pathways for ingestion and dermal contact exist between surface water/sediment and all receptors expected at the sites. The groundwater exposure routes are expected to be partially complete pathways for all potential receptors since there are three active water supply wells located just east of Weston Lake.

Potentially complete pathways for all exposure routes for both surface and subsurface soil exist for all receptors. Since access to and activities in these areas are not restricted, the potential for soil disturbance to occur exists. Also, the subsurface pathways would be potentially complete for biota because they may nest or burrow in these areas.

6 CONCLUSIONS

The following conclusions for the cantonment area, FJFC, and Weston Lake Area MMRP sites were made based on the information reviewed for this HRR.

6.1.1 Cantonment Area Ranges/Sites

The CTT Range Inventory identified four ranges in the cantonment area: the 1000-Yard Range, 600-Yard-Range, Machine Gun Range, and Live Hand Grenade Court 2. Based on maps and aerial photographs reviewed during the preparation of the HRR, the locations of the 1000-Yard Range and the 600-Yard Range were adjusted slightly to the north. The information reviewed for the HRR also revealed the following newly identified ranges:

- 300-Yard Range
- Pistol Range
- Transition Range
- Pistol Range NR 2
- Landscape Target Range
- 1000-Inch Range Nos. 14, 15, 16

In addition, seven other ranges were identified in the area north of Hampton Parkway (Ranges North of Hampton Parkway). Based on changes to the operational range boundary during the HRR review process, these ranges were determined not to be eligible for inclusion in the Fort Jackson SI because they are located in the operational range area.

The CTT Range Inventory listed the Andrew Jackson Range as one of the ten MMRP sites. The Andrew Jackson Range was originally a military small arms range that had been closed. The site has been turned over to the Fort Jackson MWR Department for operation as a recreational small arms shooting range. Because of its current activity and the ongoing

releases that have occurred after September 30, 2002, it was determined that this site is not eligible for evaluation as part of the Fort Jackson SI.

Based on the HRR conclusions, three MMRP Sites are located in the cantonment area. The ranges identified in the cantonment area have been grouped by period of use, type of use, and location to form these MMRP Sites. Although some of these ranges overlap, the range acreages are only counted for the MMRP Site in which they are grouped. A brief discussion of each MMRP Site follows:

The Camp Jackson Ranges include the 1000-Yard Range, 600-Yard Range, Machine Gun Range, 300-Yard Range, and the Pistol Range. These ranges cover an area of 81 acres and were used for small arms training from 1918 through 1920. As such, no MEC and only limited MC are anticipated at the Camp Jackson Ranges.

The Small Arms Ranges East of Chesnut Road include the Transition Range, Pistol Range NR 2, Landscape Target Range, and 1000-Inch Range Nos. 14, 15, 16. These ranges were used for small arms training in the 1940s through the 1970s. As such, no MEC and only limited MC are anticipated at these ranges.

The Live Hand Grenade Court 2 includes a three acre area that overlaps the 300-Yard Range. Acreage for this area has only been included for the Live Hand Grenade Court 2. This range only appears on the 1946 and 1949 source maps. Based on the historical maps, the range was used in the 1940s and possibly the 1950s. The Live Hand Grenade Court 2 is the only range with MEC potential; however, this area has been disturbed by field fortification training (e.g., trenching and using the area to teach fortification techniques) and forestry activities. MEC, if present, would be limited.

Table 6-1, on the following page, provides a summary of the cantonment area MMRP sites an associated sub areas (ranges).

Table 6-1: MMRP Site and Associated Sub Areas Conclusion Summary for Cantonment Area Ranges/Sites

Area	Size	Description
Camp Jackson Ranges 1000-Yard Range 600-Yard Range 300-Yard Range Machine Gun Range Pistol Range	81 acres	Small arms only
Small Arms Ranges East of Chesnut Road Transition Range 1000-Inch Range Nos. 14, 15, 16 Pistol Range NR 2 Landscape Target Range	546 acres	Small arms only
Live Hand Grenade Court 2	3 acres	MEC - Hand grenades

6.1.2 Fort Jackson Flight Club

Additional munitions types at the FJFC were identified during the research for this HRR. Historical maps revealed several overlapping range fans with associated munitions other than small arms. Both firing points/lines and target areas exist within the FJFC. The additional munitions types are associated with the following ranges: an M18AI anti-personnel mine range, an M-79 grenade launcher range, and an M-72 LAW rocket launcher range. During the visual survey conducted at the FJFC on June 17, 2004, possible MEC including 40-mm grenades and 35-mm sub-caliber rockets were observed. Review of HRR information also identified an area at the FJFC that is not overlapped by ranges/range fans. As such, the acreage for the FJFC was revised to only include the 42-area of the FJFC that has had range use. Based on range use, MEC may be anticipated in the northern portion of the FJFC; however, the southern portion of the range was used only for small arms training. As such, the FJFC has been split into two sites: FJFC Salerno Ranges and FJFC Small Arms Ranges. Table 6-2 provides a summary for the FJFC.

Table 6-2: MMRP Site Conclusion Summary for FJFC Ranges/Sites

Site Name	Size	Description
FJFC Salerno Ranges	15 acres	MEC - Rockets Rifle grenades Grenades Claymore mines
FJFC Small Arms Ranges	27 acres	Small arms

6.1.3 Weston Lake Area Ranges/Sites

The CTT Range Inventory identified four ranges in the Weston Lake Area: the Mortar Range, Hand Grenade Court No. 2, the Rifle Grenade Range NR 2, and the Submachine Gun Area. Based on maps and aerial photographs reviewed during the preparation of the HRR, the locations of these ranges were adjusted from the CTT Range Inventory to better represent the areas where the range use occurred. Based on changes to the operational range boundary during the HRR review process, the Hand Grenade Court No. 2 and the Rifle Grenade Range NR 2 were determined not to be eligible for inclusion in the Fort Jackson SI because they are located in the operational range area.

Based on the HRR conclusions, two MMRP Sites are located in the Weston Lake Area: the Mortar Range 5A, 7, and 8 Safety Fans (i.e., the Mortar Range in the CTT Range Inventory) and the Dismounted and Moving Vehicle Submachine Gun Area (i.e., the Submachine Gun Area in the CTT Range Inventory). The ranges have been grouped by period of use, type of use, and location to form these MMRP Sites.

For acreage reporting purposes, the CTT Range Inventory depicted the Mortar Range and the Submachine Gun Area as a contiguous area divided into the Mortar Range (western half) and the Submachine Gun Area (eastern half). However, based on the 1955 and 1956 Training Facilities Maps, the Mortar Range actually covers both the Mortar Range and the Submachine Gun Area reported in the CTT Range Inventory. For the HRR, the Dismounted and Moving Vehicle Submachine Gun Area was changed to include only the area not overlapped by the Mortar Range 5A, 7, and 8 Safety Fans (i.e., the acreage was changed

from 101 acres to 17 acres). The Mortar Range 5A, 7, and 8 Safety Fans acreage was increased from 112 acres to 306 acres to encompass the entire area that was associated in the past with mortar range use. The Mortar Range 5A, 7, and 8 Safety Fans is the only site with a potential for MEC based on historical range use. Table 6-3 provides a summary of the Weston Lake Area MMRP sites.

Table 6-3: MMRP Site Conclusion Summary for the Weston Lake Area Ranges/Sites

Site Name	Size	Description
Mortar Range	306 acres	MEC - Mortars Small arms
Submachine Gun Area	17 acres	Small arms only

Table 6-4, on the following page, summarizes the site identification number changes from the CTT Range Inventory through completion of this HRR. This information clarifies the AEDB-R Site Identification changes that resulted from the HRR conclusions.

Appendix B: Archive Documents

REPRODUCED AT THE NATIONAL ARCHIVE

Sept 18, 1917

BULLETIN, No. 12.

HEADQUARTERS 81ST DIVISION
CAMP JACKSON, COLUMBIA, S. C.

September 18, 1917.

The following proposed changes, Small Arms Firing Manual, are published for the information and guidance of this command:

"SMALL ARMS FIRING MANUAL.

CHANGES No. —.

WAR DEPARTMENT,
WASHINGTON, *August —, 1917.*

The following is added to Appendix II, Small Arms Firing Manual, 1913:

C. *Special Course when time or facilities for regular courses are not available.*

This course will be prescribed for the quick training of troops in rifle practice, when time or facilities for the regular courses are not available.

Success cannot be expected, nor can proficiency in rifle practice be attained by a company in this course, unless it has been thoroughly instructed, and each man should satisfactorily pass the prescribed tests before he fires a shot on the range. Without this thorough preliminary course, and satisfactorily passing these tests, it is a waste of ammunition to let the soldier fire ball cartridges on the range.

The soldier is first given a thorough course of preliminary practice as outlined in paragraphs 1 to 70, inclusive. He is then before being allowed to fire a shot on the target range, given the following tests:

Test I.

Nomenclature of the rifle in so far as is necessary for its efficient care and use.

Test II.

Assembling and dissembling of the rifle in so far as is necessary for its efficient care and use.

Test III.

Care of rifle.

Test IV.

Sight-setting: Normal and peep, with and without

Major Roger H. Williams
Inf.

RG 393, Army Cont Cmds, 1821-1920
Part V, Bulletins & Memoranda
Box 30

deflection. Maximum time limit of 10 seconds in each of not less than 5 consecutive trials.

Test V.

Firing Positions:

(a) Standing,
(b) Kneeling,
(c) Sitting,
(d) Prone,
(e) From parapet, wall top, or other under-rifle rest.
(f) From vertical edge of wall, door, window, tree, or similar position.

Test VI.

Loading from belt, pockets fastened, with a clip of dummy cartridges, in position.

Standing, Kneeling, Sitting, Prone — Maximum time limit of 10 seconds each in best 5 out of 7 consecutive trials.

Test VII.

Sighting: With rifle in sighting rest.

(Third sighting exercise, Par. 27.)

Normal Sight, Peep Sight — Proficiency required in 3 consecutive triangles of sighting with each. Distance 20 feet; no side of triangle to exceed 1-2 inch.

Test VIII.

Aiming combined with trigger squeeze.

Test by means of:

(a) Target machine,
(b) Aiming Rod device,
(c) Belgian aiming device, or
(d) Perforated bullseye over instructor's eye.

(Methods used to be noted by abbreviations M., R., B. and P., respectively.)

(a) Standing,
(b) Kneeling,
(c) Sitting, and
(d) Prone.

Test IX.

Rapid Loading, aiming and firing: Load from belt and simulate fire with two clips of dummy cartridges. Tested by means of:

(a) Aiming rod device, or
(b) Belgian aiming device, or
(c) Perforated bullseye over instructor's eye.

(Method used to be noted by abbreviations R., B. and P., respectively.)

In positions:

Standing,
Kneeling,
Sitting, and
Prone.

Time of each:

1 minute,
1 minute, 10 seconds,
1 minute, 10 seconds, and
1 minute, 20 seconds, respectively.

Test X.

Flinching:

In prone position. The rifle will be so manipulated by the instructor that the man under test does not know whether or not it is loaded. Service ammunition to be used.

Known Distance Practice.

An annual allowance of 150 rounds per man is authorized for Known Distance Practice, which includes Short Range Practice, Midrange Practice and Practice with Telescopic Sights.

Short Range Practice.

All firing from a typical trench, bayonet fixed except as noted, rifle resting on parapet.

REPRODUCED AT THE NATIONAL ARCHIVES

Instruction.

Table 1.—Slow Fire.

Range Yards	Time	Shots	Target	Position and Type of Trench	Sight
100	No Limit	10	A-4	Prone	Leaf
200	" "	10	A-4	Standing	5 leaf and 5 battle sight
300	" "	15	A-4	Standing	10 leaf and 5 battle sight.

(a) One-half of firing with leaf sight at this range will be with bayonet not fixed.

105 points out of possible 175 in slow fire at bullseye target necessary to advance to slow fire at figure target.

Table 2.—Slow Fire.

Range Yards	Time	Shots	Target	Position and Type of Trench	Sight
100	No Limit	5	Head	Prone	Leaf
200	" "	5	F	Standing	"
300	" "	5	F	"	"

9 hits out of possible 15 required to advance to rapid fire.

Table 3.—Rapid Fire.

Range Yards	Time	Shots	Target	Position and Type of Trench	Sight
100	One Minute	10-20 (b)	Head	Prone	Leaf
200	" "	10	F	Standing	"
300	" "	10	F	"	"

18 hits out of possible 40 required to advance to Record Practice.

Soldiers who fail to make the necessary points to advance are given further instruction practice to the limit of the ammunition allowance.

Record.

Table 4.—Rapid Fire.

Range Yards	Time	Shots	Target	Position and Type of Trench	Sight
100	One Minute	10-20 (b)	Head	Prone	Leaf
200	" "	10	F	Standing	"
300	" "	10	F	Standing	"

(b) At this range the soldier must fire 10 rounds; he may fire as many more as he can up to 20 rounds and receive credit for every hit he makes. Soldier is penalized 1 point for each round less than ten that he does not fire.

Total shots—130.

Mid Range Practice.

For all men who have made 25 hits or more in Record Practice.

Table 5.—Slow Fire.

Range	Time	Target	Shots	Position
500	No Limit	B	10	Prone
600	" "	B	10	Prone

Every effort will be made to teach the men the effect of wind, light and temperature, and the value of small changes in elevation and windage.

No report of this firing will be required, although a record of it will be kept in each company.

Practice With Telescopic Sights.

After Mid Range Practice has been completed, the four best enlisted shots of the company will fire as prescribed in Par. 117.

Combat Practice.

Combat Practice, individual and collective, will be fired by an organization after the completion of the Known Distance Practice.

REPRODUCED AT THE NATIONAL ARCHIVES

REPRODUCED AT THE NATIONAL ARCHIVES

An annual allowance of 50 rounds of ammunition per man, to be expended under the direction of the regimental commander, is authorized for this practice.

Targets.

Target A-4 is the A target, as described in Par. 258, cut down to 4 feet square. The rapid fire is conducted as at present prescribed under Procedure Rapid Fire, page 71, with the exception that at all ranges the soldier assumes the firing position before the command "Ready" is given.

The Head Target is the top of the E Target cut off 12 inches from the top. (C. S. A. F. M. No—, Aug.—, 1917.) (353.1, A. G. O.)

Department Commander.

Commanding General, Camp Jackson, Columbia, S.C.

Small Arms Target Ranges for Divisional Training Camps.

1. With reference to the attached letter (copy herewith) from the Adjutant General of the Army, dated Washington, [illegible] 1917, in relation to the selection of suitable Rifle Ranges for Camp Jackson, attention is requested as to the progress made in the selection of a suitable Rifle Range for Camp Jackson, showing [illegible]

[illegible]

Wm. A. Burnett
Major General, U.S.A.

ADJUTANT GENERAL
In Absence of Department Commander.

1st Ind. CMD-C

HQ., 81st Div., Camp Jackson, S.C., October 17, 1917.—To Commanding General, Southeastern Department, Charleston, S. C.

1. A suitable small-arms range adjacent to this camp has been selected and surveyed and work of clearing has begun. Target material is either on hand or en route and the range will be ready for use before the troops are prepared to use it.

2. The range lies adjacent to the cantonment site, about a mile and a half east of the nearest barracks, and is part of the large tract, a three year lease hold of which is to be obtained under authority of the War Department, by condemnation proceedings. The U. S. Attorney is now engaged in the preliminary work of instituting legal proceedings, but as many of the property owners of the tracts on which the range, proper, is situated have given their consent to the use of the land, and work was begun without waiting for the actual institution of condemnation proceedings.

3. The range will have 200 targets for 300-yard rifle practice, 24 machine-gun targets, 34 600-yard targets, and 8 1000-yard targets. All can be used simultaneously. Any part of the 300-yard range can be used for pistol targets and in addition good sites for pistol practice are available nearer camp.

684 - Target Ranges

HEADQUARTERS 306th ENGINEERS
CAMP JACKSON, COLUMBIA, SOUTH CAROLINA.
December 17th, 1917.

FROM: The Division Engineer, 81st Division.

TO: The Commanding General, 81st Division.

SUBJECT: Depopulation of area beyond target range.

1. In view of the fact that it is expected to begin target practice on the small arms range about January 1st, 1918, it is recommended that steps be taken for the removal of all inhabitants in the tract to the east of the range for a distance of three miles, and to post danger signals and signs on all roads leading in behind the butts for the same distance to the eastward.

684 - Target Ranges.

684 - Target Ranges

Acting Chief of Staff

Brigade Commanders and Commanding Officer 306th Engineers.

Small Arms Target Range.

1. The Commanding General desires that you be informed that the small arms target range will be ready for use on the 1st. of January. The Range Officer will assign on the 300 yards range, 24 targets to each infantry regiment, to the 316th Field Artillery, and 306th Engineers for purposes of instruction. The 316th Field Artillery will be grouped with the 161st. Inf. Brigade and its small arms practice carried on under the general supervision of the Commanding General of that Brigade. The Range Officer will apportion targets on the 600 and 100 yardsranges in such a manner as future developments may indicate best.

2. The Commanding General desires that the first work on the range be devoted to the instruction of officers. Brigade Commanders and Commanding Officer, 306th Engineers, will make necessary arrangements for systematic instruction. The known distance course for all men now in the command will be completed on or before the 7th of February, 1918, leaving the range free after that date for the instruction of men who may have joined in the interim.

3. Attention is invited to paragraph 4, G.O. 43, December 8th, these Headquarters, which gives the schedule of gas instruction for the command.

4. It has been stated that battery harness will not be available for National Army divisions before the first of March. We have applied by telegraph for harness for one battery, which there seems to be a probability of our receiving in the near future.

5. Infantry field equipment is not yet in sight. Bayonets for Enfield rifles will be available.

6. With the above considerations as to equipment for instructions and allotment of time for gas instruction and small arms practice, the Commanding General desires that you submit your programs for the month of January not later than the 25th instant, for approval.

Major, Inf., U.A.

CONSTRUCTING QUARTERMASTER

CAMP JACKSON

Columbia, S. C.

January 17, 1918.

From: Constructing Quartermaster, Camp Jackson.
To: Officer in Charge of Cantonment Construction,
Washington, D. C.
-Completion Report-

1. In accordance with your letter of November 2nd, requesting report of operations during the construction of this cantonment, file 600.914 CR-C (General), the following is submitted:
We have the following recommendations to make for consideration in case additional cantonments are constructed:

2. TIMEKEEPING: The practice employed at this cantonment of having the Government keep the time is not in my opinion a proper one to use in future work. The principal objection to it is that the contractor loses a certain control over his men. I believe that the actual disadvantage of this system more than outweighs the slight additional cost of having the contractor keep his own time and having a smaller Government force check it. I consider the practice of having booths for checking the men in and out essential.

3. PAYROLL SIGNATURES: I respectfully call attention to the practice of requiring signatures on pay rolls. With laborers this resolves itself into a farce, as practically none of them sign their names, and in view of the fact that the making a mark is a prefunctory practice, I believe that in the interest of efficiency the requirement should be abolished, and the signatures omitted. This is the practice which practically all large contracting firms have adopted.

4. COMMISSARY: I believe more efficient results will be obtained by compelling the contractor to sublet his commissary so that he may be able to devote his entire time to the actual performance of the work. The practice of running the commissary for profit has become so general that it is difficult for contractors to form the idea that the commissary on these emergency projects should be run on a cost basis.

5. SECRET SERVICE AGENTS: Secret service agents should be assigned to each project, as soon as actual construction commences. We worked here several months without one and the work done by the agent after he arrived showed that his services were necessary.

6. NEWSPAPER ADVERTISMENTS: Contractors in signing the contracts should be given to understand that no newspaper advertisements shall be placed in localities where other emergency work is being performed. The same applies to solicitation of labor from other Government projects. We have had a great deal of difficulty from that source at this cantonment due to the fact that wages paid elsewhere have been very much higher and that distance does not prevent the men from going to a new job in view of the fact that their transportation is refunded.

DECLASSIFIED
Authority NND 803038
By CO NARA Date 3-24-04

2.00 and $3.00, the original being delivered to the employee and the duplicate being held by the time-keeper's office. In order to have a signed evidence of payment (although the payment was only in the nature of a commissary ticket) in case the employee made no more time than he used up in Commissary credit the checks were designed to show the signature of the employee to whom they were issued.

A form, Requisition for refund of Transportation, was used in cases where transportation was refunded employees who had been on the work one continuous week or more.

Two forms were used in conjunction in cases where there were complaints of shortage, in time.

Other forms used were: A card record of the monthly foreman,

An outside time checkers report, was used in a bound book of 100 pages each. The outside checking department also kept a complete check on livestock and equipment, same being reported on a separate form. This department also checked teams, reporting same on "Team report".

A Report of Discharge Checks issued for the information of the Superintendents, and showing the total number of discharge checks issued daily.

74. The property on which the rifle range is located is situated east of the Cantonment. It is a strip of land 13200 feet wide; it averages about 42000 feet in length, and contains 13093.81 acres. It is rolling sand hill country covered principally with scrub oak, of the black jack variety, interspersed with a few pine trees, and is very sparsely settled. This land was largely acquired by condemnation proceedings. In laying out the 300 yard rifle range it was found that the lay of the land would not permit of shooting directly from the firing trench to target trench without danger of the bullets going over the property line, and so in order to take advantage of the ridges, which do not lie parallel to the property line, it was necessary to construct the trenches in echelon. This required slightly more trenching work but formed a layout which was so much more practical that it was decided to do the work, and it was all completed prior to January 1st. The method used in constructing the trenches has already been described in Paragraph 6.

75. All of the field engineering at this Cantonment was handled by the Field Engineer, Mr. James E. Gibbons, and the Engineering and Inspecting force was recruited from all over the East. By forming our own engineering organization, we avoided the payment of any engineering fees excepting the salaries of the men themselves. The only exception to this was the contract with the Supervising Engineer, Mr. P. H. Norcross, who was paid on contract a salary of $7500, plus his expenses, for designing the sewer system, water system, etc.

76. Two of the Commissioned Officers mentioned in Paragraph 3, Captains Frisbe and Holmar, not being up to the Standard, were released about August 4th and were sent to other Camps. Captain Moore, who had been in charge of the property account, was ordered away for similar duty elsewhere, we were sorry to lose his services. The other three officers stayed on the job until its completion and formed a very well-balanced staff-- Capt. Crunden having charge of Administration, Capt. MacDonald supervising the building operations, fire protection and equipment installations, and Capt. Dinkins having charge of transportation. The faithfulness and ability of these men are largely responsible for the completion of the work.

77. In appendix B we have shown rates of pay of the various classes of labor employed at Camp Jackson.

HEADQUARTERS, CAMP JACKSON,

Columbia, S. C.,

614 (C) Misc. Div. July 23, 1918.

From: The Commanding General.

To: The Adjutant General of the Army, Washington, D. C.

Subject: Report on Small Arms Range, Camp Jackson, S. C.

1. Pursuant to instructions in letter from the Adjutant General's Office, War Department, Washington, D.C., July 13, 1918, the following report is submitted:

(a) There is one rifle range, four miles from the center of camp, with targets as follows: Short range (100, 200 and 300 yards), two hundred (200) targets. Mid range (500 and 600 yards) thirty-four (34) targets. Long range (800 and 1000 yards) six (6) targets.

(b) There is no pistol range. The short range for rifle firing can be used for pistol range by trimming paper targets to fit 4 x 4 foot frames.

(c) There are two machine gun ranges (1000 inch ranges) right in camp. One on the east side and one on the west side of Camp. These are small ranges and were used for the training of officers. One machine gun range (1000 inch range) of seventy-two (72) targets, on tracks, four miles from the center of camp.

(d) There are three Combat firing ranges for small arms and machine guns. Combat range No. 1 is four miles from center of camp. Combat Ranges Nos. 2 and 3 are five miles from center of Camp.

(e) Artillery range of 14000 by 6000 yards four miles from center of Camp with sufficient capacity for training one Brigade of Field Artillery.

2. The facilities are sufficient for the training of a division. The ranges reported upon were used by the 81st Division and were considered ample.

3. A map is submitted herewith showing location of ranges.

A. G.

RECEIVED
JUL 30

REPRODUCED AT THE NATIONAL ARCHIVES

REPRODUCED AT THE NATIONAL ARCHIVES

July 13, 1918.

From: The Adjutant General of the Army.

To: The Commanding Officers of all Regular Army, National Guard, and National Army Camps and Cantonments.

Subject: Small Arms Ranges at Divisional Camps and Cantonments.

The Secretary of War directs that a report be submitted as to the facilities available at your camp for the instruction of troops in small arms and machine gun firing covering:

(a) Rifle ranges, distance and number of targets.
(b) Pistol ranges, number of targets.
(c) Machine gun ranges (1000 inch ranges), number.
(d) Combat firing ranges for small arms and machine guns.
(e) Artillery ranges.

The report should show the distance of the ranges from the center of the camp or garrison, and whether or not the facilities are sufficient for the training of a division. If possible, a map should be submitted. If the facilities of any class are not sufficient the report should show what measures are necessary in order to secure them.

Adjutant General.

GENERAL COMPLETION REPORT

ON

NORTH CAMP JACKSON

AS ABANDONED OF FEBRUARY 28, 1919.

H. J. Macdonald

CAPTAIN, Q. M. CORPS,
CONSTRUCTING QUARTERMASTER.

RG 92 [illegible]
E. 1974-A Completion Reports [illegible]
P. 891

THE CONTRACT

The contract is the ordinary Government form for emergency work which in this case constituted the construction of an Artillery Cantonment near Camp Jackson, S. C. to be known as North Camp Jackson.

The contract was made and concluded the 2nd day of September, 1918, by and between the HARDAWAY CONTRACTING COMPANY, Columbus, Georgia, represented by B. H. Hardaway, it's President, party of the first part, hereinafter called "The Contractor", and the UNITED STATES OF AMERICA, by R. C. Marshall, Jr., Brigadier General, U. S. Army, acting by the authority of the Secretary of War, party of the second part, hereinafter known as "Contracting Officer."

On September 6th, 1918, in accordance with the approval of the Assistant Secretary of War under date of August 21st, 1918, authority was given the Constructing Quartermaster, North Camp Jackson, to proceed with the construction of a Field Artillery Cantonment.

The amount approved for this construction was Nine Million Dollars ($9,000,000).

The authorization number for the construction of the above named Artillery Cantonment was Project Number 6015-1.

THE PROJECT

LOCATION

Attached find Appendix "C" showing location of North Camp Jackson with respect to Camp Jackson and the City of Columbia, S. C. As is shown on this Appendix you will note that the two camps proper are distant by about two miles and North Camp Jackson is distant from Columbia by about seven miles.

The main highway connecting the City of Columbia and North Camp Jackson is known as the Two Notch Road or the highway connecting the City of Columbia and the City of Camden, S. C. Dents Pond, popular for its bathing, is located equidistant from the two sites. The main road to Camp comes off said Two Notch Road at what is known as Dents Station on the Sea Board Air Line Railway.

The site for the Artillery Camp was picked so that its drill ground lies on a very long high ridge forming the divide between two creeks - Jackson Creek being on the western side of the Camp and Gill Creek on the eastern side, both of which flow into the above spoken of Dents Pond.

The Constructing Quartermaster upon arrival on the site August 26th, 1918, found that about six hundred and eleven (611) acres, more or less, of the wood land had been cleared off by the forces of the Harry F. Hann Contracting Company who was the contractor on some improvements made at Camp Jackson and who anticipated the con-

tract for the construction of North Camp Jackson.

On September 4th, 1918, the work of clearing was turned over to the Contractor, The Hardaway Contracting Company, who finished same. Construction equipment and teams were requisitioned at once and on the above date construction had begun on a temporary spur track from the Sea Board Air Line Railroad serving the Camp.

RESERVATION AND BOUNDRIES

Attached find Appendix "D" showing the boundries of the reservation and the acreage contained in same. The letters shown on this plan refer to detailed plans which are shown on an attached Appendix lettered "D-1". Blue prints or original plans are on file in the office of the C.Q.M., Camp Jackson.

The parcel lettered "A" or the original Camp Jackson area contained eleven hundred and ninety two (1192) acres, Parcel "B" contains fifteen hundred and forty five (1545) acres, Parcel "F" the tract covered by North Camp Jackson contains five thousand seven hundred and sixty five (5765) acres. The total acquisition constitutes approximately thirty six thousand two hundred and forty five (36,245) acres, more or less.

8

RAILROADS

Attached find Appendix "J" showing railroad layout. The main line of the Sea Board Air Line Railroad forms the western boundary of the reservation. This being the only common carrier in the vicinity it was readily found necessary to construct a spur for the purpose of distributing the construction material in the construction area. The Supervising Engineer had already begun a location for this spur which in the opinion of the Constructing Quartermaster, was much larger and more expensive than was necessary. The second day on the site, the Constructing Quartermaster and a party reconnoitered and finally selected a location which proved to be at least a mile shorter and far less expensive. Three days later construction was begun on same and by September 16th, 1918, accommodation for 100 cars was made.

The only difficulty encountered was a swamp over which was built a fourteen foot (14') trestle about 400' long, a photograph of which is attached. This is known as the trestle crossing Jackson Creek. This temporary line is shown on Appendix "J". It was built on the shortest course (with a maximum allowable grade of 2%) to the drill grounds; thence down drill grounds giving as near as possible equal distribution of material to all construction. This constituted a length of 13786 lin. feet of which about 5300 lin. feet was used as permanent line, about 1500' being used in connection with track serving Quartermaster's

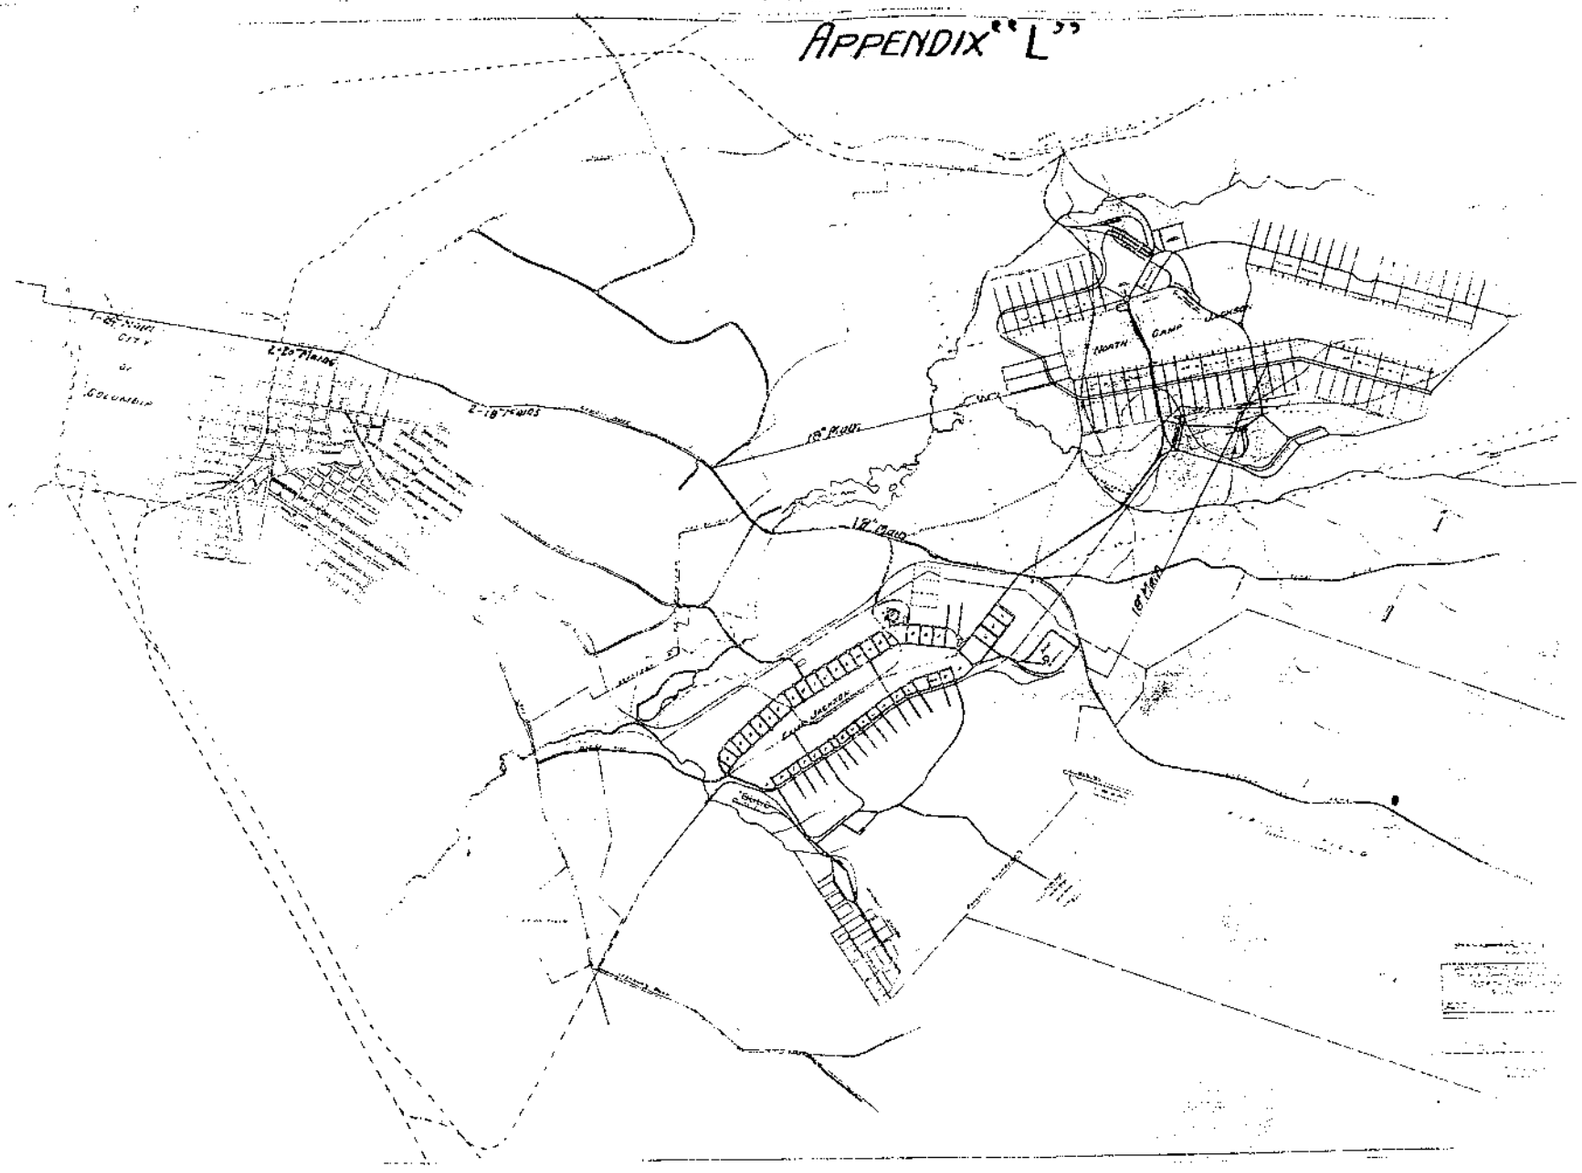
APPENDIX "L"



HEADQUARTERS CAMP JACKSON,
Columbia, S. C.

DAILY BULLETIN NO. 32.

Wednesday, February 11, 1920.

THE FOLLOWING IS PUBLISHED FOR THE INFORMATION AND GUIDANCE OF ALL CONCERNED. NOTE:- Organization commanders will be held responsible for the compliance by all members of their commands with all orders published in this Bulletin.

1. CAUTION! ! FIRING ON TARGET RANGE!

1. ON FRIDAY, FEBRUARY 13TH, FROM 8:00 TO 11:00 A. M., THERE WILL BE COMBAT FIRING EXERCISES ON THE SMALL ARMS TARGET RANGE, TWO MILES EAST OF CAMP. THE DIRECTION OF FIRE WILL BE FROM WEST TO EAST. ORGANIZATION COMMANDERS WILL CAUTION THEIR COMMANDS TO KEEP OUT OF THIS AREA ON THAT DATE.

2. ECONOMIC USE OF LONG-DISTANCE PHONE CALLS.

1. In placing Long Distance Telephone Calls, the following instructions will govern:-

2. Unless it is especially desired to speak to some particular party at the other end, officers will not place a "Person to Person Call" but will place a"STATION TO STATION CALL" in the following manner:-

"Captain Jones, 123, Camp Jackson calling the Zone Supply Office (not officer) at Atlanta". Upon being questioned by Long Distance whom you wish to converse with, the reply will be "ANYBODY" and NOT "anybody who can talk business" or similar phrase.

3. The following form will be used only when it is necessary to converse with some particular person:-

"Captain Jones, 123, Camp Jackson calling Captain Smith, Zone Supply Office, Atlanta".

For this person to person service a higher rate is charged.

3. KAHN TAILORING COMPANY. BRANCH DISCONTINUED.

1. The Agency of the Kahn Tailoring Company which has been maintained at the Central Camp Exchange has been discontinued.

over.

BULLETIN
NO. 33.

Thursday, February 19, 1920.

THE FOLLOWING IS PUBLISHED FOR THE INFORMATION AND GUIDANCE OF ALL CONCERNED. NOTE:- Organization commanders will be held responsible for the compliance by all members of their commands with all orders published in this Bulletin.

1. ENLISTED MEN TO REPORT AT CAMP HEADQUARTERS.

1. Organization commanders will send all enlisted men of their units, who have served at Camp Jackson less than three months and who are not enrolled in any school to Camp Headquarters on TUESDAY, FEBRUARY 24TH, 1920, D.B.L. These men will be reported to the Director of Schools.

2. CAUTION! FIRING ON TARGET RANGE.

1. ON FRIDAY, FEBRUARY 20TH, from 8:00 to 11:00 A.M., THERE WILL BE COMBAT FIRING EXERCISES ON THE SMALL ARMS TARGET RANGE, TWO MILES EAST OF CAMP. THE DIRECTION OF FIRE WILL BE FROM WEST TO EAST. ORGANIZATION COMMANDERS WILL CAUTION THEIR COMMANDS TO KEEP OUT OF THIS AREA ON THAT DATE.

3. POST EXCHANGE MONTHLY INVENTORY AND CREDIT NOTES.

1. The inventory of the Post Exchange will be made on the 25th of the month, except that when that date falls on Sunday, inventory will be made on the following day.

2. Credit Notes may be issued to enlisted men by Company, Battery and Separate Detachment Commanders on any day of the month but the required report of such issue will be made to the Exchange Officer on the 25th of each month. Notes issued between the 25th and last day of the month will be reported on the 25th of the following month.

3. Special care will be exercised by above mentioned commanders to see that the correct amount of notes issued is reported in order to expedite the checking and cancelling of these notes on pay day.

4. Instructions contained in paragraph 2 of Daily Bulletin No. 12, these Headquarters, January 16, 1920, in conflict with the above are rescinded.

THE FOLLOWING IS PUBLISHED FOR THE INFORMATION AND GUIDANCE OF ALL CONCERNED. NOTE:- Organization commanders will be held responsible for the compliance by all members of their command with all orders published in this Bulletin.

1. MEETING OF RANGE OFFICERS OF ALL ORGANIZATIONS.

1. A meeting is directed of the range officers of all organizations at the office of the Camp Signal Officer at 11:00 a. m. Wednesday, February 25, 1920.

2. Range Officers will find out from their organizations the number of men their organizations will have to fire on the range for 1920, the season to commence at an early date.

3. All range officers are advised of War Department letter of January 31, 1920 to Commanding General, Southeastern Department which states:-

"The Small Arms Firing Manual, 1913 1t 38mg revised.....Course "A" will be prescribed for all troops armed with the rifle as the principal weapon for offensive combat. This includes Infantry, Cavalry and Engineers. The Course provides for firing at 200, 300, 500 and 600 yards on Targets "A", "B", and "D".

Course "B" will be prescribed for all troops armed with the rifle as a weapon for defensive action only. This includes Motor Transport Companies, Balloon Companies, Headquarters Troops of Infantry Divisions, Coast Artillery Corps, and miscellaneous individuals armed with the rifle. This course provides for firing at 200 yards only on Target "A"."

4. Organizations of Camp enumerated to fire in this letter which have no range officer will send a representative to the meeting to act as such.

2. CAPTURED ENEMY MATERIAL.

1. Captured enemy material held by individuals or organizations in this camp which has not been reported to the Ordnance Department will be listed and the lists turned in to Camp Headquarters without delay.

THE FOLLOWING IS PUBLISHED FOR THE INFORMATION AND GUIDANCE OF ALL CONCERNED. NOTE: Organization commanders will be held responsible for the compliance by all members of their commands with all orders published in this Bulletin.

1. CAUTION! FIRING ON THE TARGET RANGE! ! !

ON FRIDAY, MARCH 5, 1920, FROM 8:00 TO 11:00 A. M. THERE WILL BE COMBAT FIRING EXERCISES ON THE SMALL ARMS TARGET RANGE, TWO MILES EAST OF CAMP. THE DIRECTION OF FIRE WILL BE FROM WEST TO EAST. ORGANIZATION COMMANDERS WILL CAUTION THEIR COMMANDS TO KEEP OUT OF THIS AREA ON THAT DATE.

2. REPETITION OF WAR DEPARTMENT ORDERS REGARDING ARMY MUSICIANS.

1. Attention is again called to paragraph 261, A. R. It is reported that the provisions of the above regulation as to unlawful competition with local civilian musicians have been violated in specific instances since the publication of Paragraph 2, Daily Bulletin No. 43 these Headquarters.

2. Regimental commanders will take the action necessary to prevent their respective bands or any members thereof from furnishing music outside the limits of the reservation when the furnishing of such music places them in competition with local civilian musicians.

COPY

HEADQUARTERS CAMP JACKSON
COLUMBIA, S. C.

June 29, 1920.

FROM: Commanding Officer.

TO: Commanding General, Southeastern Department, Charleston, S. C.

SUBJECT: Answers to Questionnaire.

1. In compliance with paragraph 2, letter No. 600. 9- (Posts, Camps, and stations, S. E. Department) Headquarters, Southeastern Department, dated June 5, 1920, the following answers to the Questionnaire from the War Plans Division, General Staff, dated May 10th, 1920, is submitted:

1. Location and Area.

(a) Location

Camp Jackson is located approximately six (6) miles due east of Columbia, S.C.

(b) Area

21,946.6 Acres, or 34.29 square miles.

2. General characteristics of the reservation and surrounding territory in so far as these affect the training of troops. For training of what class of troops is reservation suitable - Infantry, cavalry, field artillery, coast artillery, engineers, tanks, etc.

(a) The country is rolling and covered with woods and undergrowth broken by many open spaces. There are many good camp sites and ample room for practice marches and maneuvers without danger of destruction to valuable crops or trespass on valuable farm land. There is an abundant supply of water for animals throughout the country roundabout. The topsoil is heavy sand; the subsoil is clay. There is little mud even during a rainy season as the water either drains off rapidly or is absorbed by the sandy soil. It is possible to drill troops within half an hour after a rain of twelve or more hours duration. The sand is but little shifted about by light winds and dust storms are infrequent. There are no prevailing high winds and no long seasons of rain.

RG 393 Army Cont. Cmds, 1821-1920
Part II, Camp Jackson
Gen Corr, 1917-1920
Box 24

REPRODUCED AT THE NATIONAL ARCHIVES

(b) The country is well suited for training of field artillery, infantry, engineers, and signal corps troops, there being suitable ground for unlimited target practice for these branches. For mounted troops the ground is easily gotten over but would prove heavy for drill ground work. Motorized heavy artillery finds considerable difficulty in moving heavy guns about, the ten-gun Holt tractors not having enough power to haul the guns, such as the 155 G.P.F. and the 8" Howitzer, where the sand is heavy. The same applies to tanks; the ground is favorable for the light tank but not for the others.

At present there is nt enough cleared ground in the vicinity of the barracks for dismounted and mounted drill. This defect can be remedied by clearing ground in close proximinity to the camp proper.

3. Amount and character of construction, capacity for troop shelter, permanent and temporary, for officers, enlisted men and animals. Show the data called for in this paragraph relative to permanent Construction listed separately from that pertaining to temporary Construction:

CONSTRUCTION

(a) Temporary Southern Army Cantonment:

Kind.	No.
Officers'	106
Barracks	358
Infirmaries	21
Mess and Kitchens	25
Administration	28
Offices	3
Guard Houses	19
Stable Guard	20
Bathhouses and Latrines	369
Stables	164
Storehouses	63
Sheds	96
Shops	25
Garages	6
Fire Stations	6
Heating Plants	3
Post Exchanges	18
Hospital Section	87
Theatre	1
Oil Filling Station	1
Laundry	1
Schools	7
Bakery	1
Septic Tank	1
Hotels	8
Stockade	1
Watch Towers	10

REPRODUCED AT THE NATIONAL ARCHIVES

(b)	Capacity men and Officers		47,860	
	Tent space for		22,000	
		Total	69,860	
	Capacity for Animals:			
	Camp Proper		8,320	
	Remount Area (Originally)		10,000	(now converted into Vocational Farm)
		Total	18,320	
(c)	Permanent Construction:			
	Grain Elevator	1		
	Magazines	4		
(d)	Hospital Capacity:			
	Beds	2,500		
	Personnel:			
	Nurses	200		
	Officers	200		
	Enlisted men	900		

4. Climatic conditions affecting training (number of outdoor working days by month for calendar year).

The annual rainfall is 45.7 inches. The mean temperature 65.4; lowest 24. In summer the temperature is at times so high that strenuous outdoor work is impracticable, but during the winter it is never too cold for such work. There are no prevailing high winds and no prolonged rainy season. For this reason, with the exception of a very few days in mid-summer, outdoor work can be carried on the entire year. Counting Sundays and holidays as working days the following working days by month can by counted on:

January - 31
February - 25 - 3 days of rain.
March - 31
April - 30
May - 25
June - 20 - 5 days of rain - 5 days of excessive heat.
July - 20 - 5 days of rain - 6 days of excessive heat.
August - 20 - 5 days of rain - 6 days of excessive heat.
September - 25 days
October - 31
November - 30
December - 31.

5. Communication within, to and from the area, including roads, railroads, trolley lines, telegraph, telephone, and available landing fields for airservice.

REPRODUCED AT THE NATIONAL ARCHIVES

Communications, etc.:

1. (Within Post Proper) Roads: Class A. - Concrete - 2.78 miles. Class A - Bituminous Macadam - 8.26 miles. Class C - Sand Clay - 6.62 miles. Total Class A Roads 10.98 miles. Total Class C Roads 6.62 miles.

1. (a) Within Reservation - Class C Roads - Sand Clay - 21.6 miles (exclusive of Post roads).

2. Miles of Railroad Track - 0.2 miles (This track is used jointly by the Atlantic Coast Line, Seaboard Air Line and Southern Railroads, operating through spur from Atlantic Coast Line Railroad).

3. Telegraphic Communications - Western Union and Postal Telegraph.

4. Telephone - Bell Long Distance and local to Columbia, S.C.

5. Current - Lighting, etc. Current is furnished by City of Columbia, S. C., through a 23,000 volt, 3 Phase Line, stepped down through transformers in Camp.

6. Water Supply - From mains from City Pumping Station.

Camp Storage Capacity is as follows: Concrete Reservoir of 1,300,000 gallons, 3 tanks of 200,000 gallons and 1 small tank of 50,000 gallons, giving a total storage capacity of 1, 950,000 gallons.

7. Communication with the Camp is effected by one well paved bituminous and concrete road and one sand-clay road and a trolley line leading directly from Columbia, S.C., to points east, north and south within the camp. There are three railroads leading to camp as follows: Atlantic Coast Line, Seaboard Air Line, and Southern, operating through joint spur as stated above.

8. Aviation Facilities - There is an aviation field, not owned by the Government, approximately two miles south of Camp, three fourths square mile in area. In addition there are several landing places scattered through-out Camp, large enough to accommodate at least two airplanes.

9. Existing target ranges for both infantry and artillery with possibilities of adaptation to musketry training (field firing) for infantry and service firing for field artillery.

(a) For small arms practice a complete range equipped with 65 targets, capable of expansion to 100 targets at all ranges with ideal spots adapted to musketry training. During the War there were 500 targets. Suitable ranges for the maximum number of troops that can be accommodated can be provided.

REPRODUCED AT THE NATIONAL ARCHIVES

(b) The Artillery range adjacent to and joining the Camp proper is approximately nine and one-half miles long and three and one-half miles wide, and affords facilities for every phase of artillery practice.

7. Additional tracts suitable for target ranges, infantry and field artillery, and their characteristics. Possibility of acquisition (a) for ordinary peace time training; (b) in an emergency requiring sudden expansion of peace time facilities. Distance from post and communications.

North of the Camden Road, immediately adjoining the present range and parallel thereto, is a large stretch of land similar in every respect to the present range, both as to size and characteristics, and suitable for infantry and field artillery target ranges.

POSSIBILITY OF ACQUISITION:

(a) For ordinary peace time training, -can be obtained only at exhorbitant cost.

(b) In an emergency requiring sudden expansion of peace time facilities - Can be obtained by lease, purchase of condemnation.

Distance from post and communications. - Tract is immediately adjoining present reservation on the North. Main road is the Camden Road running along the South side of the tract. This is an improved road at present in poor condition. Other roads throughout tract are merely trails, or unimproved roads.

8. Visitors Accommodations on reservation or in the immediate vicinity.

There are two large Y.W.C.A. houses in camp with limited facilities for the accomodation of visitors. There are also ten Y.M.C.A., two K. C., one Christian Science, and one Jewish Welfare buildings, with no sleeping quarters. There is one first class hotel in the City of Columbia, S. C., six miles distant and several second class hotels. All are expensive, generally crowded, and the service is poor. Accommodations with private families in Columbia are expensive and difficult to obtain.

9. Facilities for quartering families of troops on or near the reservation.

A number of families of Officers and enlisted men are at present occupying some of the temporary buildings not required for the use of the troops. Should these ever be required for troops there will be no accommodations in camp for families of troops.

REPRODUCED AT THE NATIONAL ARCHIVES

There are no other accommodations on the reservation, and in the city of Columbia accommodations are scarce and extremely expensive when obtainable.

10. Recreational facilities on or near the Reservation.

On the reservation there is one athletic field including a baseball diamond, one baseball field, one polo field, one large building, formerly belonging to the Y.M.C.A., suitable for a gymnasium, equipped with bowling alleys, but nothing else, and one Liberty Theatre, capacity 2200, in which moving pictures are shown and road shows presented. Six Service Clubs for enlisted men are in operation, and there is one Library.

Near the Reservation there is only the City of Columbia where the usual moving picture shows are in operation, and one public swimming pool on the outskirts of the city. The Y.W.C.A., the Y.M.C.A., the Knights of Columbus, and other fraternal organizations welcome enlisted men to their halls.

11. Formal capacity for training Purposes:

(a) Of Reservation Proper:
Officers and men in barracks - 47,860

Tent Space for	22,000
Total	69860

(b) Including adjacent ground now available for training purposes without cost to the Government.
None

12. Expansion Capacity:

(a) Including (11) above.

It is assumed that this question was intended to read, "Including (a) above". On this assumption, the numbers given in (a) above are considered to be the maximum capacity, viz., 69,860.

(b) Including ground in addition to (b) above that may be leased, purchased or condemned in the event of an emergency, using the ground formerly known as North Camp Jackson, just North and practically adjoining the Northwestern corner of the present reservation, which could be obtained through lease, purchase, and condemnation, in the event of an emergency the capacity could be expanded to 100,000 officers and men. Furthermore this tract lies adjacent to the main line of the Seaboard Air Line Railway.

13. A copy of each existing map of the reservation.
There are being forwarded under separate cover one blue print copy of each of twenty-four existing maps of the reservation.

REPRODUCED AT THE NATIONAL ARCHIVE

14. Any other information concerning the reservation which would be of interest in estimating its value as a training rendezvous for:

(a) The existing military establishment. Camp Jackson has ample facilities for housing and training at present 40,000 troops. Columbia, S. C., a town of 41,000, six miles distant, and connected with the Camp by a railroad spur, street car line, one macadam road in good condition, and one fair sand-clay road, is the junction point for three main southern railroads, viz., the Seaboard Air Line, the Atlantic Coast Line, and the Southern Railway. Training can be carried on outdoors practically the entire year round, due to the comparatively mild winter, and the absence of a prolonged rainy season. A noted winter resort, Camden, S. C., is thirty miles from Camp. Charleston, S. C., one of the most important ports of the South is only 128 miles distant.

Considerable repair work on the buildings would be necessary, however, for the carrying out of this project. Also, there would be no accommodation in camp for the families of officer and enlisted men with this number of troops, and the cost of rental of civilian quarters near the reservation would become prohibitive.

(b) A system of universal military training:

Owing to the number of railroads entering Columbia, S. C., and the excellent communication between the camp and the city, Camp Jackson with its present facilities would lend itself excellently to forming a part of such a training system.

(c) A mobilization and training of full man power of the nation (7,000,000 men program).

Owing to its location with reference to the three lines referred to, paragraph 14 (a) above, the ports of Charleston, S.C., and Savannah, Ga., and the possibilities of expansion of the present reservation, Camp Jackson, S.C., would form an important unit in the training and mobilization of the full man power of the nation. The possibilities of expansion are practically limited only by the capacity of the railroads for transportation of troops, material and supplies. The tracts referred to in preceding paragraphs as being available for are for the greater part uncultivated land and of small actual value, though held at a high price by the owners when the Government is in the market.

HARRY R. LEE,
COLONEL, INFANTRY,
Commanding.

RECORD

RECORD

RECORD

JUL 17 1923

HEADQUARTERS EIGHTY-SECOND DIVISION
ORGANIZED RESERVES

OFFICE OF THE EXECUTIVE OFFICER
COAST ARTILLERY RESERVE COMPANIES

COLUMBIA, S. C.

684 - Camp Jackson, S. C.

Subject: Rifle Range.

To: C.O. IV Coast Artillery District.

1. It is recommended that a rifle Range for the use of Civilian Rifle Clubs and the instruction of citizens of military age, as outlined in paragraphs 1 and 2, Special Regulations No.109, W.D. 1920, be opened on the Military reservation at Camp Jackson, South Carolina.

2. If this range is opened I am willing to be appointed instructor in Rifle Marksmanship in addition to my other duties. This would include the care and responsibility for the government property involved. One enlisted assistant would be required.

3. It is recommended that this range be divided into two parts: viz, a small bore range and a service range. The small bore range should be constructed near the camp entrance and in close proximity to the car line. There is a suitable location available. This range could be constructed at a very reasonable cost.(About $100.00) There is a suitable range already constructed for service firing and a small expenditure would make this serviceable. This range is not easily accessable except by automobile. hence would not be used for small bore firing.

4. An initial issue of the following material would provide a working equipment; viz, 5 service rifles; 5 .22 caliber New Model Springfield Rifles; 1 Service Ramrod; 2 Ramrods for .22 caliber rifles; 5000 patches; 5000 rounds service ammunition; 25,000 rounds .22 long rifle cartridges; 1000 gallery targets; 200 targets A; 20,000 white pasters; 15,000 black pasters; cleaning material, preferable Hoppe's Nitro powder solvent; 200 yards of target cloth; suitable paste and gun oil. Considerable salvaged material could be used in this work.

5. In my opinion a large number of reserve officers would avail themselves of an opportunity to take this rifle instruction. There is a growing rifle club in Columbia that would expand to a considerable size. A general enthusiasm for shooting would be fostered and the army would secure much favorable comment as the result of such a range being established.

~~HEADQUARTERS I CORPS~~
614 OFFICE OF THE CORPS COMMANDER HOC/lw
COLUMBIA, S. C.

February 24, 1941.

Subject: Construction of Training Aids.

To : Commanding General, First Army, Governors Island, New York.

1. Reference letter Headquarters First Army, file and subject as above, dated February 10, 1941, delays in the completion of range facilities have somewhat interfered with the progress of training. These delays, which have not been serious, were occasioned at Fort Jackson by the purchase of land, the time element incident to drawing of plans and specifications, and the letting of contracts.

2. Progress of Construction.

a. Fort Bragg, North Carolina

(1) 300-target Range:
(a) 70 completed by February 9th.
(b) 70 additional to be completed by March 1st.
(c) All to be completed by April 1st.

(2) 6 antitank sub-caliber ranges complete.
(3) 2 antiaircraft miniature ranges complete
(4) Moving target ranges, ample in operation.
(5) Sunken antitank ranges:
(a) 1 complete by March 15th.
(b) 2 additional to be completed by April 15th
(6) Infantry combat ranges one-third (1/3) complet by March 10th.
(7) Pistol range--200 complete by March 1st.

b. Fort Jackson, South Carolina.
(1) New ranges at Fort Jackson, South Carolina, will be in use about April 1, 1941, consisting of the following:

(a) 400-target Known-Distance Range.
(b) 8 - 1000" Moving Antitank.
(c) 4 - 1000" Antiaircraft.
(d) 200 - 1000" Bobbing Target.
(e) 20 sets, 1000" landscape.
(f) 200 pistol targets.

TRAINING MEMORANDUM
Number 33

PLATOON COMBAT FIRING PROFICIENCY TESTS

Reference: 1. Training Memorandum number 10, Hq I Army Corps, CS.
2. Ltr. GHQ, 353/652-6 (10-30-41), Oct 30, 1941, Subject "Post Maneuver Training".

1. The platoon Combat Firing Proficiency Tests as directed by reference 2, above will be held for the platoons of this division during the period May 28 - June 13 as follows:

a. May 28, 29, 30, June 1, 2, 3, - 13th Infantry.

b. June 8, 9, 10, 11, 12, 13, - 28th and 121st Infantry.

2. Assignment of Ranges.

a. 13th Infantry (except 81mm Mortar Platoons) - Combat Range #5.

b. 28th Infantry (except 81mm Mortar Platoons) - Combat Range #5.

c. 121st Infantry (except 81mm Mortar Platoons)- Combat Range #6.

d. 81mm Mortar Platoons, all Regt's - Mortar Range #1

3. Place.

a. Units firing on Combat Range No. 5, will report to the testing board at RJ Camden Rd. - Percival Rd.

b. Units firing on Combat Range No. 6, will report to the testing board of RJ Percival Rd. - Unimproved Rd. to Combat Range No. 6.

c. Units firing on Mortar Range No. 1, will be notified of the place to report.

4. Time.

a. Units firing on Combat Ranges No. 5 and 6,
The first platoon to be tested each day will report at 6:30 AM. Other platoons will follow at one hour intervals until eight (8) platoons have reported.

b. Mortar Platoons
Mortar platoons will be notified of the time to report.

Fort Jackson, S.C.
December 3, 1942.

GENERAL ORDERS)
NUMBER 63

POST RANGE REGULATIONS

1. General Order #39, this Headquarters, dated June 24, 1941 is rescinded.

2. General Information.

   a. The purpose of these regulations is to govern the use of firing ranges and to prescribe safety precautions to be observed in service firing.

   b. All firing on the Reservation will be EAST of TELEPHONE ROAD as follows:

      (1) LEESBURG AREA: Small Arms firing will be conducted on the Leesburg Rifle Range.

      (2) ARTILLERY AREA: Artillery firing will be conducted in the area EAST of TELEPHONE ROAD exclusive of the Leesburg area. Infantry combat and Anti-Tank Ranges in the Artillery Area will be under control of the Artillery Area.

   c. When firing is in progress, signals will be displayed as follows:

      (1) LEESBURG RANGE: Red streamers on poles in rear of firing lines on ranges C-H-R.

      (2) ARTILLERY AREA: Red streamer on Tower Wichks Hill-(13.4-13.7) or Tower on Hill (15.7-21.2) depending on whether ANCRUM FERRY ROAD or OLD CAMDEN ROAD is closed to traffic. Red flags will also be displayed in vicinity of all firing points.

   d. Persons entering the reservation EAST of TELEPHONE ROAD will inform themselves as to the firing scheduled or in progress. The current days firing will be posted on maps located as follows:

      (1) Artillery Range Central. (C.R. Ancrum-Ferry and Telephone Roads).

      (2) Leesburg Range Central.

      (3) Office of the Post Range Officer, Post Headquarters.

      (4) See par. 12.

3. Range Control.

   a. The Post Range Officer will control the Range and will coordinate all firing on the Fort Jackson Reservation.

      (1) LEESBURG RANGE:

         a. The Assistant Post Range Officer at Leesburg will represent the Post Range Officer, with direct charge of all firing on Small Arms Ranges in the Leesburg Area. An organization firing on the Small Arms Ranges will appoint a Range Officer who will contact the Assistant Post Range Officer to arrange for targets and other materials, also for posting Range Guards.

Authority NND 997030 By MD NARA Date 3/15/04

RG 337 Hq Army Ground Forces, E. 108 (U.S.), AGF - AFF Journals Box 31

(2) DIVISION ARTILLERY RANGE OFFICER.

a. The Divisions or similar units will detail one Field Artillery Officer as Assistant Range Officer for the period when the Artillery of the Division is firing on the Artillery Range. This officer will function as Assistant Post Range Officer with respect to Artillery firing of his Division. He will report to the Post Range Officer for instructions on the day when requests for Artillery Firing reach the Post Range Officer, and forty-eight (48) hours before each days firing.

4. Range Detachment.

a. A permanent detachment will operate under the orders of the Post Range Officer. The Range Detachment will operate the Post Range Communication System. It will establish sentinels, signs and road blocks as directed by the Range Officer and will keep range maps posted.

5. Governing Regulations.

a. The provisions of AR 750-10 will govern all firing. The provisions of appropriate Field Manuals will govern the firing of the particular weapon.

6. Range Telephone System:

a. Traffic diagram of the Range Telephone System is in the Office of the Post Range Officer.

b. Tapping of circuits on the Range Telephone System at other than installed terminal strips, or cutting or rearranging of any installed circuit, is forbidden.

c. Requests for special circuits will be submitted to Post Range Officer one (1) day in advance.

d. Damage to telephone cables or metallic circuits on Artillery Range will be reported to Artillery Range Central immediately; damage to installations on Leesburg Range to Leesburg Range Central.

e. Permanent pole lines of the range telephone system will not be used by troops.

f. All field wire will be disconnected at the conclusion of each day firing.

7. Assignment of Ranges.

a. The general assignment of the Small Arms Ranges and the Artillery Ranges will be announced by Post Headquarters.

(1) LEESBURG RANGE:

(a) The organization assigned the Leesburg Range will inform the Assistant Range Officer, Leesburg, of the calibers and ranges on which firing is to be conducted twenty-four (24) hours in advance, except in the case of 50 caliber Machine Gun, when forty-eight (48) hours notice will be required. (See Part II.)

(2) ARTILLERY AREA:

(a) In accordance with priorities prescribed by regulations and orders of these Headquarters, the Post Range Officer will assign firing areas, will prescribe the limitations on firing therein, the safety limits, and any other restrictions necessary for safety.

Authority NND 947630
By MD NARA Date 3/15/94

(b) When an organization has been assigned priority on the range, requests for firing areas approved by that Organization Headquarters will be acted on promptly in the order in which received, and the assignment made within twenty-four (24) hours after receipt of request. The Range Officer will approve requests as submitted, except where the limits of the requested area must be modified for safety reasons. In this event, the Range Officer will promptly confer with the organization Headquarters to arrange suitable modification.

(c) Units other than those normally assigned the Artillery Area, desiring to fire Special Problems will submit requests for firing areas to the Post Range Officer ten (10) days in advance of the proposed firing.

(d) 37-mm and 75-mm Anti-Tank Firing by units in areas involving both the Leesburg Area and the Artillery Area will be arranged by the Post Range Officer upon request.

(e) Sentinels for enclosing the danger area will be furnished by units conducting fire and will be posted by the Artillery Range Officer under the direction of the Post Range Officer.

8. Publication of Firing Memorandum:

a. A weekly Firing Memorandum is issued by Post Headquarters every Friday morning at 8:00 A.M. covering all firing for the succeeding week. Overlays will accompany requests for Artillery Ranges and will reach the Post Range Office in time to be checked and the information placed in the Firing Memorandum. It is necessary that this information be furnished the Post Range Officer. The Post Range Officer must know at all times what firing is being conducted, the position and danger areas.

b. The following form will be used to submit requests:

TO: POST RANGE OFFICER, HEADQUARTERS.

Request following Firing Memorandum:

(Signed by officer requesting Memorandum.)

(Submit only one copy)

FIRING MEMORANDUM NUMBER _____

DAY OF WEEK
DATE
HOURS OF FIRING

RIGHT SECTOR LIMIT: GUN
LEFT SECTOR LIMIT: GUNS
MAXIMUM RANGE (YARDS)
DANGER LIMIT (YARDS)
RESPONSIBLE OFFICER
REMARKS

Authority NND 947030 By MD NARA Date 3/18/04

9. Duties of the Post Range Officer.

a. The Post Range Officer is responsible for the coordination of activities on the range and for the safety of the entire range.

b. When requests for firing positions are submitted, the Range Officer will adjust any conflicts as to areas, check safety provisions, and will issue a Firing Memorandum prescribing the safety limits for each position.

c. When request for an area is submitted, the Firing Memorandum will define the area assigned. The officer supervising the exercise will prescribe safety provisions for each position in compliance with paragraph 7, AR 750-10.

d. When required, in addition to the usual warning issue to personnel of the Post, announcement will be made in the daily papers.

e. The Post Range Officer is responsible for the posting of permanent signs on the reservation.

10. Duds:

a. The Post Ordnance Officer is charged with the destruction of "duds" on the Range.

b. "Duds" discovered on the Range will be marked by a stake and reported to the Post Range Officer. Reports will show type and caliber of each "dud" location by coordinates, and the name of any person familiar with its location. Artillery units conducting fire will report location of any suspected "duds" during the day's firing.

c. Officers in charge of Mortar Firing will police range for "duds" at the completion of firings and report the location of all duds to the Post Range Officer.

11. Permanent Installations:

a. Artillery firing will not be placed within 500 yards of permanent installations except dugouts.

b. All dugouts, except #5 dugout, are constructed to offer protection against caliber 105-mm and less. Dugout #5 offers protection against 37-mm and less.

c. Permanent roads, bridges and dams may be included in firing areas, but no adjustment will be made on such installations. Every precautions will be taken to prevent direct hits on such installations. Precautions will be taken to assure that firing will not endanger permanent telephone lines.

12. Danger Areas.

a. The size of the reservation and the nature of the terrain prevent the posting of guards to cover all approaches to danger areas. The danger areas will be marked by signs at points where sentinels are not posted. These signs will not be passed by personnel, except in the following cases:

(1) Personnel going to and from service firing on safe routes designated by the unit commander in charge of the firing.

(2) Officers and parties accompanied by an officer checking through the Range Central and signing the range book. In this case, the officer accepts responsibility for a complete knowledge of the danger areas and of all firing in progress.

Authority NND 947630 By MD NARA Date 3/15/04

13. Battery-Commander:

a. The Battery-Commander is responsible that:

(1) Safety precautions prescribed in AR 750-10 regarding handling of ammunition and service of the piece are complied with.

(2) A red flag is displayed in a conspicious place in the vicinity of the battery position during firing.

(3) That all personnel of the battery are properly instructed as to safety precautions in general, and in particular as to the location of adjacent gun positions and sector of fire.

(4) When the shell is fired other than with bore safe fuses, or fuses considered in the category of bore safe, all personnel within the danger limits are protected as prescribed in paragraph 14, AR 750-10.

(5) The Range Central is promptly notified on completion of firing.

(6) The area used will be policed at the end of practice.

14. Battery Executive:

a. The Battery Executive is responsible for safety of the personnel at the firing position, (AR 750-10). He will fire only when the safety officer indicates safe to fire.

15. Battery Safety Officer.

a. In all Artillery firing, the Battery Safety Officer will have no other duties. He will indicate safe to fire only when:

(1) The Range Officer indicates the range is clear.

(2) The Range visible to him is clear.

(3) The pieces are so laid as to fire inside the safety limits both for direction and for range as determined by the quadrant elevation corresponding to the maximum range designated in the Firing Memorandum.

PART II

SMALL ARMS RANGE, LEESBURG

16. General Information.

a. The duties of the Assistant Post Range Officer (SA) on the Leesburg Rifle Range, will be as follows:

(1) Maintain all ranges to insure proper operation.

(2) To furnish all target material the Table of Allowance provides.

(3) To turn over all camp property to Organization Range Officer, or Supply Officer.

(4) To see that the ranges are not abused and that all the Government property is taken care of and used properly.

(5) To ascertain that no changes are made in safety angles for any range.

(6) To allow no changes to be made by using troops in any of the ranges.

Authority NND 947630 By MD NARA Date 3/15/04

(7) To permit the unauthorized use of weapons, [illegible] in weapons and ammunition not authorized for use on that particular range.

(8) Maintain and supervise the use of the camp and range utilities.

17. Duties of Organization (SA) Range Officer.

a. To take over the Leesburg Range and camping facilities, including all the property and return same at end of firing period to the Assistant Range Officer (SA) in good serviceable condition.

b. To assist all targets, quarters and facilities to the using troops.

c. To furnish guards and transportation and posting the necessary guard to keep the danger area clear of personnel during the hours of firing.

d. To act as representative for the using troops in which case all requests made by using troops will be made to him only.

e. Report to Post Range Officer any facilities assigned and not being used.

18. Location of Ranges:

a. Ranges are designated as follows from the most westerly range (A) through east to the most northerly range (Z)

(A) 100 Machine Targets, 30 caliber only

(B) 30 Pistol Target, 45 Caliber

(C) 1 AA Range, 22 Caliber

(D) 1 AA Range, 22 Caliber

(E) 100 Pistol Targets, 45 Caliber

(FG) 100 Rifle 200 yds., 30 Caliber

(HI) 100 Rifle 300 yds., 30 Caliber

(JK) 100 Rifle 300 yds., 30 Caliber

(LM) 100 Rifle 200 yds., 30 Caliber

(N) 4 sets Anti-Tank, 30 Caliber only.

(O) Trench Mortar.

(P) 100 Machine Gun, 30 Caliber and 50 caliber.
(NOTE: .50 caliber to be used only by arrangement with Post Range Officer.)

(Q) 35 Targets Pistol, 45 Caliber.

(R) 100 Target plain 1000", 30 Caliber

(S) 1 set AA Targets, 22 Caliber only.

(T) 1 set AA targets, 22 Caliber only.

(U) 8 sets of Landscape, 30 Caliber only.

(V) 25 Pistol Targets, 45 Caliber.

(W) 6 sets of Landscape, 22 Caliber only.

(X) 25 Pistol targets, 45 caliber.

(Y) 4 sets Anti-Tank, 22 Caliber.

Authority NND 947630
By MD NARA Date 3/18/09

(Z) 4 sets Sub-Machine Gun targets, 45 Caliber.

b. Each range is distinctly marked by a large conspicuous, designating letter. Also the type of ammunition to be used.

19. Control and Safety Regulations:

a. Guards will be posted under the supervision of the Organization Range Officer, so as to provide safety during the hours of firing, unless otherwise requested.

b. When all guards are posted, red streamers will be raised on poles in rear of Ranges C-H and R. No firing will be started until these streamers are raised. All firing will cease when streamers are lowered. A change in these streamers will be preceded by a long blast on the siren located at the water tank connected to tower. With no streamer raised, the blast will indicate that the streamer is to be flown. A series of blast on the siren, after firing has begun will indicate that all ranges will cease firing immediately.

c. Each range will be operated under the senior officer in charge. Where pits are provided, the pits will be under the supervision of an officer. Range procedure will be followed as specified in training manuals, for the arm being fired.

d. Prior to firing, the officer in charge of a range will notify the pit officer who will order the streamer on the target line to be raised when the pit is clear. Thereafter, no person will be allowed to stray from the pits, or leave the pits except by the authorized tunnels. Pit details will be instructed to operate and travel under the shelter.

e. An overlay will be furnished by Post Range Officer from time to time as to the location of the range guards. As the situation warrants, the location of these guards will change.

f. It will be the duty of the using troops to furnish one (1) non-commissioned officer and the guard for the range, and the duty of the organization (SA) Range Officer to ascertain that they are properly posted and instructed.

g. Ranges have been constructed to conform to Army Regulations for safety. Ranges will be used only for the purpose for which they were constructed (see paragraph 1). Special problems may be fired by arrangement with the Post Range Officer.

h. On all Combat Ranges and other Ranges beyond hearing distance of the siren at the water tank, the officer in charge of firing will communicate with the Leesburg Range Office to determine whether the Range Guards are posted and whether the Range is clear. At most of the Ranges telephone communication is established with the Range Detachment. The officer in charge of firing will notify the Leesburg Range Detachment Officer when firing is concluded each day.

i. The Officer in charge of firing will be responsible that the Range he uses is properly policed, targets are properly pasted or replaced for the next day, and any repairs that cannot be made on the "spot" will be reported to the Range Detachment at the conclusion of the day's firing.

j. Combat Ranges 1-2-3-4-5-6 are designed for firing Infantry Squad and Platoon Problems with Caliber 30, ball ammunition. The safety limits are marked and the Officer in Charge of Firing will see that all firing is within the Safety Limits.

These ranges will not be used for Training Areas or "Dry Run Exercises" except by permission of the Post Range Officer.

No changes in the Range Installations will be made by troops using the ranges. No other than caliber 30 ammunition will be fired on Combat Ranges except by permission of the Post Range Officer.

Authority NND 947630 By MD NARA Date 3/15/94

20. Range Supplies and Property:

a. Ranges will be released to units when their authorized representatives have taken over the range property. This property will be maintained in good operating condition by the using unit. (Exception - broken targets, frames, etc., will be turned into the Post Range House for replacement.)

21. Communication:

a. Phones for ranges will be turned over with the range. Phones may be exchanged for repair at Post Range House.

22. Administration: - Camp Area.

a. Requests for use of the Camp Area on the Small Arms Range will be submitted to the Post Range Officer.

b. When the Camp Area is assigned to an organization, the Commanding Officer of that organization or an officer designated by him will contact the Assistant Range Officer at Leesburg and will sign for all property on Memo Receipt. Obtain from the Assistant Range Officer a proposed administrative order to the using troops covering the interior economy of the camp.

They will inspect the camp area noting any deficiencies.

c. Assignments in camp area, will be made by Commanding Officer of using troops, and administrative arrangement for the camp area, will be made under the control of the units using the area. Senior officer will command for coordination of installations.

d. Before departure, organization will:

(1) Fasten down sides of tents and loosen ropes.

(2) Stack all cots in mess halls for check.

(3) Scrub kitchen and mess halls.

(4) Clean ice box and leave open.

(5) Skim grease trap.

(6) Remove all garbage.

(7) Scrub bath house.

(8) Scrub latrines, sprinkle lime in pits, and leave covers closed.

(9) Burn out and clean all latrines.

(10) Police area.

(11) Clean incinerator and haul rubbish to dump.

(12) Return property to Assistant Range Officer and get Memo Receipt.

e. When the Post Exchange is in operation in the Camping Area the Senior Officer will issue orders regulating the hours and arranging for police and sanitary conditions. Post Exchange Officer should be informed of important changes or requests.

23. Facilities:

a. Each unit commander will notify the Organization Range Officer when he has facilities that are assigned to him and which he does not need.

Authority NND 947630 By MD NARA Date 3/18/94

b. All requests for additional facilities should be made to the Organization Range Officer.

c. Available targets and ranges will be assigned by the Organization Range Officer.

d. The following equipment and facilities for each company or similar unit are available:

(1) Mess hall and kitchen.
(2) Pyramidal tents.
(3) Cots, canvas, folding.
(4) One (1) bath house to three (3) mess buildings.
(5) One (1) latrine, pit type.
(6) Screens or pyramidal tents, for latrines and bath houses.
(7) Ice Box.

e. The following equipment must be furnished by using troops.

(1) Field range.
(2) Cooking utensils.
(3) Mess kits, complete.
(4) Bedding.
(5) Ligh Bulbs.

f. Water facilities are very limited. Arrangements must be made within organizations to conserve all that is possible and alternate the use of it between the kitchen and bath houses when necessary. No water will be used for sprinkling streets.

24. Sanitation. The Commanding Officer of troops is responsible for sanitation and will appoint the senior medical officer as medical inspector for the camp and range.

25. Range Regulations, Anti-Tank Range.

Request will be made to Post Range Officer in same manner as for Artillery Range.

a. For the present time, only the following will be fired.
75mm sand loaded and armour piercing.
37mm armour piercing, sand loaded, and sub-caliber.
50 caliber Machine Gun.

b. The motor car and target car will be operated by personnel of the Range Detachment and under no circumstances by units firing. The car operator will set the car in motion and then report to officer in charge of firing that the range is clear and ready to be fired on.

c. A flag pole is available on the firing line. A red streamer will be flown when the Range is being fired on. No firing will be permitted unless the red streamer is being flown. It will be the duty of the officer in charge of firing to cause the streamer to be hoisted and lowered. Before the car operator goes forward, the order cease firing and lower the flag will be given. Upon return from target car the operator will report to officer in charge that range is clear and ready to be fired on. The officer in charge will order the flag to be hoisted and command begin firing.

d. The officer in charge of firing will furnish transportation for car operator to go to and from the target car to eliminate so much lost time when adjustments are to be made on car and target.

e. There is a white post at each end of the firing line. Pieces that are to be fired will take up positions between these posts.

f. Pieces that are merely for tracking purposes may be placed on an extension of the firing line.

g. There are two white poles 800 yds out with pieces of target cloth attached to the top which are to be used as right and left [illegible] markers respectively.

Authority NND 947630
By MD NARA Date 3/15/94

h. The car is able to operate at two speeds, slow speed which is 5-15 miles per hour. Fast speed is from 5-25 miles per hour. The car operator will set the car at either speed the officer in charge of firing so desires. No other speed will be used except the above listed, without permission of the Post Range Officer.

26. Range Fires:

a. The control of fires resulting from firing on the range is the responsibility of the Officer in Charge of Firing.

When a fire on the range is observed the Officer in Charge of Firing on that range will immediately contact the Post Range Officer or his Assistant to determine the danger area.

If the fire is located inside a danger area the Range Officer or the Assistant Range Officer will stop all firing in that area. The Officer in Charge of Firing will then proceed to extinguish the fire.

b. Unit Commanders in the vicinity of the fire will give assistance when called upon to do so.

c. There are tools available for fighting range fires at the Leesburg Range Headquarters Detachment.

d. During extremely dry weather when the danger of Range Fires is imminent Officers in Charge of Firing will inspect the impact areas of their ranges for fires at the conclusion of each days firing.

27. This General Order will be included in Post Regulations at a later date.

By command of Brigadier General BEEBE:

A. T. MURPHEY
Colonel, F.A.
Adjutant.

REDESIGNATION OF UNITS.--1. Pursuant to instructions contained in letter AG 320.2 - Headquarters Fourth Service Command, Subject: "Consolidation and Redesignation of Detachments, Station Complement, Fourth Service Command", dated December 26, 1942, the following units of the Station Complement, this station, are redesignated as indicated, effective December 31, 1942.

Former Designation	New Designation
Service Detachment, Branch No. 1, Supply Division.	Section No. 1, Supply Detachment, Supply Division (with Chemical Warfare Service, Engineer, Ordnance, Quartermaster Corps and Signal Corps Sub-sections.)
*Service Detachment, Branch No. 2 Supply Division.	*Section No. 2, Supply Detachment, Supply Division.
*Service Detachment, DEML.	*Post Detachment.

2. The Arm or Service designation of enlisted personnel of Section No. 1, Supply Detachment, Supply Division, will be governed by the designation of the Section to which the individual is assigned to duty.

3. Final and initial rosters will be rendered on WD AGO Form No. 309 for the above redesignations, in compliance with Paragraphs 12 and 13, AR 345-900.

By command of Brigadier General REDHE:

A. T. MURPHEY,
Colonel, FA,
Adj.

* Negro personnel.

HEADQUARTERS FOURTH SERVICE COMMAND, Atlanta, Georgia; December 10, 1942
TO: Commanding General, Army Ground Forces, Washington, D. C.

1. The proposed layout for the moving vehicle range is considered satisfactory but attention is called to the following:

a. If 50 calibre ammunition is to be fired on this range, the danger area should be increased 1,000 yards to 3,600 yards.

b. If possible, more safety should be provided between this proposed range and the existing combat range #2. This may be accomplished by swinging the line of fire on the combat range to the east and/or moving the proposed vehicle range back closer to State Highway # 262.

2. Comment is requested as to number of installations of the types specified considered necessary for Fort Jackson; and as to estimated cost, which this Headquarters considers excessive.

684 - GNGCT/13428 (10-5-42) 9th Ind.

HEADQUARTERS ARMY GROUND FORCES, Army War College, Washington, D. C., To: Commanding General, Fourth Service Command, SOS, Atlanta, Georgia.

1. As long as sufficient land is available, it is not the policy of this headquarters to comment on the safety limits of ranges except insofar as it pertains to safety angles. It is believed that the depth of danger zones should be determined by the type of ammunition being used at the time.

2. It is considered necessary to have a total of the following type ranges at Fort Jackson in order to provide necessary training aids:

	Type	Number
a.	Live Grenade Courts	2
b.	Moving Vehicle Ranges	
	(1) MG (Page 100, FM 23-50)	1-(3 lanes)
	(2) Thompson Sub MG (Page 58, FM 23-40)	1
c.	Thompson Sub MG Range (dismounted)(Page 41, FM 23-40)	1-(12 firing points)

3. a. The construction of 2 a. above should be as simple as possible and should be independent of each other for operation.

b. Reference 2 b. (1) above, this range should provide three (3) adjacent lanes as indicated in FM reference. It is requested that this range be placed so that no other range lies within the area formed by drawing an angle of 45° to the outside of the two outside lanes. Obstacles on this range should be removable, so that firing may be conducted from either full track or wheeled vehicles.

c. Reference 2 b.(2) above and 2 c. above -- it is requested that the safety angle of 30° be used in this construction and that the twelve (12) firing points on the dismounted range be independent of each other.

4. There are no records available which would indicate the cost of the above construction but it is agreed that it should be as simple as possible.

For the COMMANDING GENERAL:

83665

Operations Division, AGF

Memorandum for Record:

Basic fr Fourth Serv Comd requests CG, Ft. Jackson to submit plans for 1 sub-MG range, 1 Moving Vehicle Range, 1 Grenade Court (live). States CG, Second Army has requested installation of same.

1st Ind fr Hq., Ft. Jackson, SC, AG 614-General, Nov. 20, 1942 to CG, 4th Serv Comd submits detailed plans for the ranges in question. However, requests 4 grenade courts instead of 1, 5 moving vehicle ranges instead of 1.

2d Ind fr Hq, Fourth Serv Comd, AG 614-General,(10-5-42) dated Nov. 23, 1942 to CG, Ft. Jackson returns correspondence to Ft. Jackson requesting that safety angles and danger areas be checked.

3d Ind fr Hq Ft Jackson, AG 614-General (10-5-42) dated Nov. 25, 1942 to CG, 4th Serv Comd., returned correspondence with the requested corrections. Also states that full danger area is not shown because advantage is taken of a high hill to receive projectiles.

4th Ind fr Hq Fourth Serv Comd AG 614-General (10-5-42) dated Nov.27,1942 to CG, Ft. Jackson states that in order to comply with AR 750-10 it is desirable that danger areas be based on the maximum ranges for ammunition used.

5th Ind fr Hq Ft. Jackson, AG 614-General (10-5-42) dated Nov. 28, 1942 to Lt. Col. Chas D. Riley, Range Officer and President, Bd of Officers orders danger areas be provided as recorded above.

6th Ind. fr Office of the Range Officer, Ft Jackson, AG 614-General (10-5-42) dated Dec. 7, 1942 to CG, Ft Jackson states that danger areas have been surveyed as shown on exhibit.

7th Ind fr Hq Ft Jackson, AG 614-General dated Dec 7, 1942 to CG, 4th Serv Comd states that 4th Indorsement was complied with.

8th Ind fr Hq 4th Serv Comd, AG 614-General (10-5-42) dated Dec. 10,1942 to CG, AGF states that proposed layout is satisfactory. Invites attention to the fact that if .50 caliber ammunition is to be fired on this range, the danger area should be increased by 1000 yards. Request comment as to the number of installations of the type specified is considered necessary for Ft Jackson and as to the estimate cost which the 4th Serv Comd considers excessive.

This action outlines the ranges that are considered necessary for the proper training of the units stationed at Ft Jackson, taking into consideration the fact that it is contemplated that a cav mechanized regt will always be stationed at this post and that the post will be used by two divs. In this answer to the 4th Serv Comd reference is made to safety angle desired by the AGF. This has the concurrence of Maj. Coyle, Misc. Br. who is rewriting AR 750-10. The grouping of the moving ~~target~~ ranges has the concurrence of Col. Ennis, Tng Br. The number of ~~moving targets~~ needed is concurred in by Lt. Col. Carnes, Tng Br. The other numbers of ranges concerned has had the necessary concurrence of Tng Br.

A COPY OF THIS GENERAL ORDER WILL BE INSERTED IN THE POST REGULATIONS AS APPENDIX "K".

HEADQUARTERS FORT JACKSON
Office of the Commanding General

Fort Jackson, S.C.
8 July 1943.

GENERAL ORDERS)
:
NUMBER 25) POST RANGE REGULATIONS

1. General Order #63, this Headquarters, dated December 3, 1942 is recinded.

2. General Information:

a. The purpose of these regulations is to govern the use of firing ranges and to prescribe safety precautions to be observed in service firing.

b. All firing on the Reservation will be EAST OF TELEPHONE ROAD as follows:

(1) SMALL ARMS FIRING will be conducted on the Known Distance Ranges at Leesburg and other ranges especially constructed or designated for Small Arms Firing.

The following weapons will classify as Small Arms:

Pistol	Cal 50 Machine Guns
Carbine	37mm Guns
Rifle	60 & 81mm Mortars
Cal 30 Machine Gun	

(2) ARTILLERY FIRING will be conducted in the area EAST OF TELEPHONE ROAD exclusive of the Small Arms Ranges.

(3) HAND GRENADES: Live Hand Grenades will be discharged on Courts especially constructed for that purpose in the Training Areas.

(4) LARGE SIZE CANNON: By arrangements with the Post Range Officer 8 inch Cannon, or larger, may be fired from positions West of Telephone Road but the Impact Area must be to the East of Telephone Road.

c. When firing is in progress, signals will be displayed as follows:

(1) LEESBURG RANGE: Red Streamers on poles in rear of firing lines on Ranges C-H-R.

(2) ARTILLERY AREA: Red streamer on Tower Wiehrs Hill - (13.4-13.7) or Tower on Hill (15.7-21.2) depending on whether ANCRUM FERRY ROAD or OLD CAMDEN ROAD is closed to traffic. Red flags will also be displayed in vicinity of all firing points.

d. Persons entering the reservation EAST of TELEPHONE ROAD will inform themselves as to the firing scheduled or in progress. The current days firing will be posted on maps located as follows:

(1) Artillery Range Central. (C.R. Ancrum Ferry and Telephone Roads.)
(2) Leesburg Range Central.
(3) Office of the Post Range Officer, Post Headquarters.
(4) See par. 12.

3. Range Control:

a. The Post Range Officer will control the Range and will coordinate all firing on the Fort Jackson Reservation.

Authority NND 947030 By MD NARA Date 3/15/04

RG 337, Hq Army Ground Forces, E 108 (U.S. Post Art Trng Sch.) Box 31

(1) SMALL ARMS RANGES:

a. The Assistant Post Range Officer at Leesburg will represent the Post Range Officer, with direct cha ge of all firing on Small Arms Ranges in the Leesburg Area. An organization firing on the Small Arms Ranges will appoint a Range Officer who will contact the Assistant Post Range Officer to arrange for targets and other materials, also for posting Range Guards.

(2) DIVISION ARTILLERY RANGE OFFICER:

a. The Divisions or similiar units will detail one Field Artillery Officer as Assistant Range Officer for the period when the Artillery of the Division is firing on the Artillery Range. This officer will function as Assistant Post Range Officer with respect to Artillery firing of his Division. He will report to the Post Range Officer for instructions on the day when request for Artillery Firing reach the Post Range Officer, and forty-eight (48) hours before each days firing.

4. Range Detachment:

a. A permanent detachment will operate under the orders of the Post Range Officer. The Range Detachment will operate the Post Range Communicatio System. It will establish sentinels, signs and road blocks as directed by the Range Officer and will keep range maps posted.

5. Governing Regulations:

a. The provisions of AR 750-10 will govern all firing. The provisions of appropriate Field Manuals will govern the firing of the particular weapon.

6. Range Telephone System:

a. Traffic diagram of the Range Telephone System is in the Office of the Post Range Officer.

b. Tapping of circuits on the Range Telephone System at other than installed terminal strips, or cutting or rearranging of any installed circuit, is forbidden.

c. Requests for special circuits will be submitted to Post Range Officer one (1) day in advance.

d. Damage to telephone cables or metallic circuits on Artillery Range will be reported to Artillery Range Central immediately; damage to installations on Leesburg Range to Leesburg Range Central.

e. Permanent pole lines of the range telephone system will not be used by troops.

f. All field wire will be disconnected at the conclusion of each day firin

7. Assignment of Ranges:

a. The general assignment of the Small Arms Ranges and the Artillery Ranges will be announced by Post Headquarters.

(1) SMALL ARMS RANGE

a. The organization assigned a Small Arms Range will inform the Assistant Range Officer, Leesburg, of the calibers and ranges on which firing is to be conducted twenty-four (24) hours before firing is to begin.

Authority NND 947030
By MD NARA Date 3/15/04

(2) ARTILLERY AREA:

(a) In accordance with priorities prescribed by regulations and orders of this Headquarters, the Post Range Officer will assign firing areas, will prescribe the limitations on firing therein, the safety limits, and any other restrictions necessary for safety.

(b) When an organization has been assigned priority on the range, requests for firing areas approved by that Organization Headquarters will be acted on promptly in the order in which received, and the assignment made within twenty four (24) hours after receipt of request. The Range Officer will approve requests as submitted, except when the limits of the requested area must be modified for safety reasons. In the event, the Range Officer will promptly confer with the organization Headquarters to arrange suitable modification.

(c) Units other than those normally assigned the Artillery Area, desiring to fire Special Problems will submit requests for firing areas to the Post Range Officer ten (10 days in advance of the proposed firing.

(d) Firing at Moving Targets by units in areas involving both the Leesburg Area and the Artillery Area will be arranged by the Post Range Officer upon request.

(e) Sentinels for enclosing the danger area will be furnished by units conducting fire and will be posted by the Artillery Range Officer under the direction of the Post Range Officer.

8. Publication of Firing Memorandum:

a. A weekly Firing Memorandum is issued by Post Headquarters each Friday morning at 0800 covering all firing for the succeeding week. Overlays will accompany requests for Artillery Ranges and will reach the Post Range Officer in time to be checked and the information placed in the Firing Memorandum. It is necessary that this information be furnished the Post Range Officer. The Post Range Officer must know at all times what firing is being conducted, the position and danger area.

b. The following form will be used to submit requests:

TO: POST RANGE OFFICER HEADQUARTERS _____

Request following Firing Memorandum:

(Signed by officer requesting Memorandum

Submit only one copy

FIRING MEMORANDUM NUMBER _____

DAY OF WEEK
DATE
HOURS OF FIRING
ORGANIZATION
CALIBER
AMMUNITION
TARGET AREA
OBSERVATION POST
GUN POSITION
RIGHT SECTOR LIMIT: GUN
LEFT SECTOR LIMIT: GUN
MAXIMUM RANGE (YARDS)

Authority NND 947030 By MD NARA Date 3/15/04

9. Duties of the Post Range Officer.

a. The Post Range Officer is responsible for the coordination of activities on the range and for the safety of the entire range.

b. When requests for firing positions are submitted, the Range Officer will adjust any conflicts as to areas, check safety provisions, and will issue a Firing Memorandum prescribing the safety limits for each position.

c. When request for an area is submitted, the Firing Memorandum will define the area assigned. The officer supervising the exercise will prescribe safety provisions for each position in compliance with paragraph 7, AR 750-10.

d. When required, in addition to the usual warning issued to personnel of the Post, announcement will be made in the daily papers, and Daily Bulletins.

e. The Post Range Officer is responsible for the posting of permanent signs on the Reservation.

10. Duds:

a. The Post Ordnance Officer is charged with the destruction of "duds" on the Range.

b. "Duds" discovered on the Range will be marked by a stake and reported to the Post Range Officer. Reports will show type and caliber of each "dud" location by coordinates, and the name, organization, and telephone number of any person familiar with its location. Artillery units conducting fire will report location of any suspected "duds" during the day's firing.

c. Officers in charge of Mortar Firing will police range for "duds" at the completion of firings and report the location of all duds to the Post Range Officer.

11. Permanent Installations:

a. Artillery firing will not be placed within 500 yards of permanent installations except dugouts.

b. All dugouts, except #5, are constructed against caliber 105-mm and less. Dugout #5 offers protection against 37mm and less.

c. Permanent roads, bridges, mockups and dams may be included in firing areas, but no adjustment will be made on such installations. Every precaution will be taken to prevent direct hits on such installations. Precautions will be taken to assure that firing will not endanger permanent telephone lines.

12. Danger Areas:

a. The size of the reservation and the nature of the terrain prevents the posting of guards to cover all approaches to danger areas. The danger areas will be marked by signs at points where sentinels are not posted. These signs will not be passed by personnel, except in the following cases:

(1) Personnel going to and from service firing on safe routes designated by the unit commander in charge of the firing.

(2) Officers and parties accompanied by an officer checking through the Range Central and signing the range book. In this case, the officer accepts responsibility for a complete knowledge of the danger areas and of all firing in progress.

Authority NND 947030
By MD NARA Date 3/18/09

(1) Safety precautions prescribed in AR 750-10, regarding handling of ammunition and service of the piece are complied with.

(2) A red flag is displayed in a conspicious place in the vicinity of the battery position during firing.

(3) That all personnel of the battery are properly instructed as to safety precautions in general, and in particular as to the location of adjacent gun positions and sector of fire.

(4) When the shell is fired other than with bore safe fuses, or fuses considered in the category of bore safe, all personnel within the danger limits are protected as prescribed in paragraph 14, AR 750-10.

(5) The Range Central is promptly notified on completion of firing.

(6) The area used will be policed at the end of practice.

14. Battery Executive:

a. The Battery Executive is responsible for safety of personnel at the firing position, (AR 750-10). He will fire only when the safety officer indicates safe to fire.

15. Battery Safety Officer.

a. In all Artillery firing, the Battery Safety Officer will have no other duties. He will indicate safe to fire only when:

(1) The Range Officer indicates the range is clear.

(2) The Range visible to him is clear.

(3) The pieces are so laid as to fire inside the safety limits both for direction and for range as determined by the quadrant elevation corresponding to the maximum range designated in the Firing Memorandum.

PART II

SMALL ARMS RANGE

16. General Information:

a. The duties of the assistant Post Range Officer (SA) on the Leesburg Rifle Range, will be as follows:

(1) Maintain all ranges to insure proper operation.

(2) To furnish all target material the Table of Allowance provides.

(3) To turn over all camp property to Organization Range Officer, or Supply Officer.

(4) To see that the ranges are not abused and that all the Government property is taken care of and used properly.

(5) To ascertain that no changes are made in safety angles for any range.

(6) To allow no changes to be made by using troops in any of the ranges.

(7) To permit no unauthorized use of ranges, such as firing weapons and ammunition not authorized for use on that particular range.

(8) Maintain and supervise the use of the camp and range utilities.

Authority NND 947630
By MD NARA Date 3/18/04

17. Duties of Organization (SA) Range Officer.

a. To take over the assigned ranges and Camping Facilities, including all the property and return same at end of firing period to the Assistant Range Officer (SA) in good serviceable condition.

b. To assign all targets, quarters and facilities to the using troops.

c. To furnish guards and transportation for posting the necessary guard to keep the danger area clear of personnel during the hours of firing.

d. To act as representative for the using troops in which case all requests made by using troops will be made to him only.

e. Report to Post Range Officer any facilities assigned and not being used

18. SMALL ARMS RANGES:

a. Known Distance Ranges are designated as follows from the most westerly range (A) through east to the most northerly range (Y).

(A) 100 Machine Targets, 30 Caliber only.

(B) 30 Pistol Targets, 45 Caliber.

(C) 1 AA Range, 22 Caliber.

(D) 1 AA Range, 22 Caliber.

(E) 100 Pistol Targets, 45 Caliber.

(FG) 100 Rifle 200 yards, 30 Caliber

(HI) 100 Rifle 100-200 yards, and 300 yards, 30 Caliber.

(JK) 100 Rifle 100-200 yards, and 300 yards, 30 Caliber.

(LM) 100 Rifle 200 yard, 30 Caliber.

(N) 4 sets Anti-Tank, 30 Caliber only.

(P) 50 Rifle 100-200-300-500 yards, 30 Caliber.

(R) 100 Target plain 1000", 30 Caliber.

(S) 1 set AA Targets, 22 Caliber only.

(T) 1 set AA Targets, 22 Caliber only.

(U) 8 sets of Landscape, 30 caliber only.

(V) 25 Pistol Targets, 45 Caliber.

(W) 100 Machine Gun, 30 & 50 Caliber.

(X) 25 Pistol Targets, 45 Caliber.

(Y) 4 sets Anti-Tank, 22 Caliber.

b. Each range is distinctly marked by a large conspicious, designating letter. Also the type of ammunition to be used.

Archives NND 947030
By MD NARA Date 3/15/04

19. Control and Safety Regulations:

a. Guards will be posted under the supervision of the Organization Range Officer, so as to provide safety during the hours of firing, unless otherwise requested.

b. When all guards are posted, red streamers will be raised on poles in rear of Ranges C-H and R. No firing will be started until these streamers are raised. All firing will cease when streamers are lowered. A change in these streamers will be preceded by a long blast on the siren located at the water tank connected to tower. With no streamer raised, the blast will indicate that the streamer is to be flown. A series of blast on the siren, after firing has begun will indicate that all ranges will cease firing immediately.

c. Each range will be operated under the senior officer in charge. Where pits are provided, the pits will be under the supervision of an officer. Range procedure will be followed as specified in training manuals, for the arm being fired.

d. Prior to firing, the officer in charge of a range will notify the pit officer who will order the streamer on the target line to be raised when the pit is clear. Thereafter, no person will be allowed to stray from the pits, or leave the pits except by the authorized tunnels. Pit details will be instructed to operate and travel under the shelter.

e. An overlay will be furnished by Post Range Officer from time to time as to the location of the range guards. As the situation warrants, the location of these guards will change.

f. It will be the duty of the using troops to furnish one (1) non-commissioned officer and the guard for the range, and the duty of the organization (SA) Range Officer to ascertain that they are properly posted and instructed.

g. Ranges have been constructed to conform to Army Regulations for safety. Ranges will be used only for the purpose for which they were constructed (see paragraph 1). Special problems may be fired by arrangement with the Post Range Officer.

h. On all Combat Ranges and other Ranges beyond hearing distance of the siren at the water tank, the officer in charge of firing will communicate with the Leesburg Range Office to determine whether the Range Guards are posted and whether the range is clear. At most of the Ranges telephone communication is established with the Range Detachment. The officer in charge of firing will notify the Leesburg Range Detachment Officer when firing is concluded each day.

i. The Officer in charge of firing will be responsible that the Range he uses is properly policed, targets are properly posted or replaced for the next day, and any repairs that cannot be made on the "spot" will be reported to the Range Detachment at the conclusion of the day's firing.

j. Combat Ranges 1-2-3-4-5-6 are designed for firing Infantry Squad and Platoon Problems with Caliber .30, ball ammunition. The safety limits are marked and the Officer in Charge of Firing will see that all firing is within the Safety Limits.

These ranges will not be used for Training Areas or "Dry Run Exercises" except by permission of the Post Range Officer.

No changes in the Range Installations will be made by troops using the ranges. No other than caliber .30 ammunition will be fired on Combat Ranges except by permission of the Post Range Officer.

Authority NND 947030
By MD NARA Date 3/18/04

k. Woods Combat Course: The Officer in Charge of Firing will see that all possible precautions are taken to avoid accidents. Before giving the order to Commence Firing he will:

(1) Ascertain that the range guard is posted.

(2) That a Red Streamer is flying in the vicinity of the firing point.

(3) That only M-2 ammunition, or ammunition with a maximum range of 400 yards is used.

(4) That all personnel operating the targets are in the pits and understanding the safety precautions.

(5) That all explosive charges placed to represent enemy fire and all "Booby Traps" are prepared and exploded under the supervision of an officer.

(6) That all troops are instructed in the safety angles of fire. The safety angle of fire is 35 degrees to the right and left of the long axis of the course.

(7) The right and left sides and the finishing end of the course are marked by a single strand of barb-wire.
The officer in charge of firing will see that all problems are conducted within this enclosure and that all troops who have completed an exercise have been moved to the Safety Zone before the beginning of an exercise.

(8) That all targets are repaired and that the Range is in operating condition at close of firing.

(9) That all personnel taking part in the exercise and all pit details wear the regulation steel helmet.

l. Infiltration Courses: The Officer in Charge of Firing will see that all possible precautions are taken to avoid accidents. Before giving the order to Commence Firing he will:

(1) Ascertain that the range guard is posted.

(2) That a Red Streamer is flying in the vicinity of the firing point.

(3) That Machine Guns have been properly laid and that the elevating and traversing stops are in their proper place to keep the fire at a minimum of 36 inches above the ground and within the bounds of the range.

(4) That only M-2 ammunition or ammunition with a maximum range of 4000 yards is used.

(5) That each gunner thoroughly understands the functions of the traversing and elevating safety stops.

(6) That an officer is on the control tower at all times during firing and that he has proper means for immediately communicating with the gunner.

(7) That all explosive charges placed to represent enemy fire, or "Booby Traps" be prepared and exploded under the supervision of an officer.

(8) That all personnel taking part in the exercise and all pit detail wear the regulation steel helmet.

m. Mock Village Course: The Officer in Charge of Firing will see that all possible precautions are taken to avoid accidents. Before giving the order to Commence Firing he will:

Authority NND 947030 By MD NARA Date 3/18/94

(1) Ascertain that the range guard is posted.

(2) That a Red Streamer is flying in the vicinity of the firing point.

(3) That only M-2 ammunition, or ammunition with a maximum range of 4000 yards is used.

(4) That all personnel operating the targets are in the pits and understand the safety precautions.

(5) That an officer is on the control tower at all times during firing and that he has proper means of communication with all the pits for which targets are operated.

(6) That all explosive charges placed to represent enemy fire and all "Booby Traps" are prepared and exploded under the supervision of an officer.

(7) That all troops are instructed in the safety angles of fire. The safety angle of fire is 90 degrees to the right and left of the center line of the street.

(8) That all targets are repaired and that the Range is in operating condition at close of firing.

(9) That all personnel taking part in the exercise and all pit details wear the regulation steel helmet.

n. Live Grenade Courts. The Officer in charge of Firing will:

(1) Take all possible precautions to insure the greatest amount of safety to personnel.

(2) See that all personnel not in trenches or behind masks are at least 250 yards from the impact area.

(3) That all personnel in the trenches and behind the mask wear the issue Steel Helmet.

(4) That a guard is posted to prevent anyone from approaching within 250 yards of the impact area.

(5) Designate an officer or Non-Commissioned Officer with the necessary assistants to check for "Duds."

(6) Upon completion of firing police the range and if any "Duds" are not exploded they will be marked and a guard posted over them until arrangements are completed for their destruction. (See par. 10)

(7) Before firing a Red Streamer will be displayed from a pole erected for that purpose in rear of the center mask. This streamer can be drawn from the [illegible] Officer. [illegible]

REFERENCES:
FM 23-30 - AR 750-10 - TM 9-1900- SNL-S-3.

o. Thompson Sub-Machine Gun Ranges, Dismounted: The officer in charge of firing will:

(1) Take all possible precautions to insure the greatest amount of safety to personnel.

(2) See that all personnel not participating in the firing remain in the area immediately in rear of the firing positions.

Authority NND 947630 By MD NARA Date 3/18/04

(3) That only the marked routes of approach to ranges are used in getting into ranges.
(These ranges are close by other ranges and if other than marked roads are used men may wander into the danger area.)

(4) These ranges have three firing points on each range. If adjacent firing points are being used they will be used simultaneously. Men will advance from positions "A" to position "B" at a signal from the officer in charge of firing.

No scoring will be permitted when there is a man firing on an adjacent firing point.

(5) At the close of firing for the day targets and target material will be removed and placed in desiginated target house, the range will be thoroughly policed, any repairs that cannot be made will be reported to Assistant Range Officer - (Telephone Tie Line 12.)

o. Thompson Sub-Machine Gun Range, Mounted: The Officer in charge of firing will:

(1) Take all possible precautions to insure the greatest amount of safety to personnel.

(2) See that all personnel not participating in the firing remain in the area immediately in rear of the firing positions.

(3) That only the marked routes of approach to ranges are used in getting into ranges.
(These ranges are close by other ranges and if other than marked roads are used men may wander into danger area.)

(4) Vehicles will drive in the direction indicated by markers when firing.

(5) No one will be permitted on the course after firing begins until the vehicle doing the firing has completed the course and all weapons have been unloaded.

(6) At the close of firing for the day, targets and target materials will be removed and placed in dosignated target house, the range will be thoroughly policed, any repairs that cannot be made will be reported to Assistant Range Officer - (Telephone Tie Line 12.)

q. Anti-Tank Range: Request will be made to Post Range Officer in same manner as for Artillery Range.

(1) For the present time, only the following will be fired.

75mm send loaded and armour piercing.
37mm armour piercing, sand loaded, and sub-cal.
50 caliber Machine Gun.

(2) The motor car and target car will be operated by personnel of the Range Detachment and under no circumstances by units firing. The Car Operator will set the car in motion and then report to officer in charge of firing that the range is clear and ready to be fired on.

(3) A flag pole is available on the firing line. A red streamer will be flown when the Range is being fired

Authority NND 947030 By MD NARA Date 3/18/04

on. No firing will be permitted unless the streamer is being flown. It will be the duty of the officer in charge of firing to cause the streamer to be hoisted and lowered. Before the car operator goes forward, the order cease firing and lower the flag will be given. Upon return from target car the operator will report to officer in charge that range is clear and ready to be fired on. The officer in charge will order the flag to be hoisted and command begin firing.

(4) The officer in charge of firing will furnish transportation for car operator to go to and from the target car to eliminate so much time when adjustments are to be made on car and target.

(5) There is a white post at each end of the firing line. Pieces that are to be fired will take up positions between these points.

(6) Pieces that are merely for tracking purposes may be placed on an extension of the firing line.

(7) There are two white poles 800 yards out with pieces of target cloth attached to the top which are to be used as right and left safety limits markers respectively.

(8) The car is able to operate at two speeds, slow speed which is 5-15 miles per hour. Fast speed is from 5-25 miles per hour. The car operator will set the car at either speed the officer in charge of firing so desires. No other speed will be used except the above listed, without permission of the Post Range Officer.

20. Range Supplies and Property:

a. Ranges will be released to units when their authorized representatives have taken over the range property. This property will be maintained in good operating condition by the using unit. (Exception - broken targets, frames, etc., will be turned into the Post Range House for replacement.)

21. Communication:

a. Phones for ranges will be turned over with the range. Phones may be exchanged for repair at Post Range House.

22. Administration: - Camp Area:

a. Requests for use of the Camp Area on the Small Arms Range will be submitted to the Post Range Officer.

b. When the Camp Area is assigned to an organization, the Commanding Officer of that organization or an officer designated by him will contact the Assistant Range Officer at Leesburg and will sign for all property on Memo Receipt. Obtain from the Assistant Range Officer a proposed administrative order to the using troops covering the interior economy of the camp.

c. Assignments in camp area, will be made by Commanding Officer of using troops, and administrative arrangement for the camp area. Senior officer will command for coordination of installations.

d. Before departure, organization will:

(1) Fasten down sides of tents and loosen ropes.

(2) Stack all cots in mess halls for check.

(3) Scrub kitchen and mess halls.

Authority NND 947030
By MD NARA Date 3/15/04

(4) Clean i_ b_ and leave op

(5) Skim grease trap.

(6) Remove all garbage.

(7) Scrub Bath house.

(8) Scrub latrines, sprinkle lime in pits, and leave covers closed.

(9) Burn out and clean all latrines.

(10) Police area.

(11) Clean incinerator and haul rubbish to dump.

(12) Return property to Assistant Range Officer and get Memo Receipt.

e. When the Post Exchange is in operation in the Camping Area the Senior Officer will issue orders regulating the hours and arranging for police and sanitary conditions. Post Exchange Officer should be informed of important changes or requests.

23. Facilities:

a. Each unit commander will notify the Organization Range Officer when he has facilities that are assigned to him and which he does not need.

b. All requests for additional facilities should be made to the Organization Range Officer.

c. Available targets and ranges will be assigned by the Organization Range Officer.

d. The following equipment and facilities for each company or similar unit are available:

(1) Mess hall and kitchen.
(2) Pyramidal tents.
(3) Cots, canvas, folding.
(4) One (1) bath house to three (3) mess buildings.
(5) One (1) latrine, pit type.
(6) Screens or pyramidal tents, for latrines and bath houses.
(7) Ice Box.

e. The following equipment must be furnished by using troops.

(1) Field range.
(2) Cooking utensils.
(3) Mess Kits, Complete
(4) Bedding.
(5) Light Bulbs.

f. Water facilities are very limited. Arrangements must be made within organizations to conserve all that is possible and alternate the use of it between the kitchen and bath houses when necessary. No water will be used for sprinkling streets.

24. Sanitation: The Commanding Officer of troops is responsible for sanitation and will appoint the senior medical officer as medical inspector for the camp and range.

25. Range Fires:

a. The control of fires resulting from firing on the range is the responsibility of the Officer in Charge of Firing.

When a fire on the range is observed the Officer in charge of firing on that range will immediately contact the Post Range Officer or his assistant to determine the danger area.

Authority NND 947030 By MD NARA Date 3/15/04

If the fire is located inside a danger area the Range Officer or the Assistant Range Officer will stop all firing in that area. The Officer in Charge of Firing will then proceed to extinguish the fire.

b. Unit Commanders in the vicinity of the fire will give assistance when called upon to do so.

c. There are tools available for fighting range fires at the Leesburg Range Headquarters Detachment.

d. During extremely dry weather when the danger of Range Fires is imminent Officers in Charge of Firing will inspect the impact areas of their ranges for fires at the conclusion of each day firing.

By command of Brig. Gen. BEEBE:

A. T. MURPHEY
Col, FA

A COPY OF THIS GENERAL ORDER WILL BE INSERTED IN THE POST REGULATIONS AS APPENDIX "K".

ARMY SERVICE FORCES
Fourth Service Command
Fort Jackson, South Carolina

GENERAL ORDER)
NUMBER 18)

PART I

16 March 1944

POST RANGE REGULATIONS

1. General Order #25, this headquarters, dated 8 July 1943 and General Order #26, dated 20 July 1943, are rescinded.

2. GENERAL INFORMATION:

a. The purpose of these regulations is to govern the use of ranges and to prescribe safety precautions to be observed in service firing.

b. All firing on the reservation will be EAST OF TELEPHONE ROAD as follows:

(1) SMALL ARMS FIRING will be conducted on the Known Distance Ranges at Leesburg and other ranges especially constructed or designated for Small Arms Firing.

The following weapons will be classified as Small Arms:

Pistol	Cal 50 Machine Guns
Carbine	37mm Guns
Rifle	60 & 81mm Mortars
Cal 30 Machine Gun	

(2) ARTILLERY FIRING will be conducted in the area EAST OF TELEPHONE ROAD exclusive of the Small Arms Ranges.

(3) HAND GRENADES: Live hand grenades will be discharged on courts especially constructed for that purpose in the training areas.

(4) LARGE SIZE CANNON: By arrangements with the Post Range Officer, 8 inch Cannon, or larger, may be fired from positions West of Telephone Road, but the Impact Area must be to the East of Telephone Road.

c. When firing is in progress, signals will be displayed as follows:

(1) LEESBURG RANGE: Red streamers on poles in rear of firing lines on Ranges C-H-R.

(2) ARTILLERY AREA: Red streamer on Tower Wiehrs Hill (13.4-13.7) when firing on the southern part of artillery range.
Red streamers on North Tower (15.7-21.2) when firing on northern part of artillery range.

(3) ALL OTHER RANGES: Red streamer in vicinity of the firing points.

d. Persons entering the reservation EAST OF TELEPHONE ROAD will inform themselves as to the firing scheduled or in progress. The current days firing will be posted on maps located as follows:

(1) Artillery Range House. (C.R. Ancrum Ferry and Telephone Roads.)

(2) Leesburg Range Detachment.

Authority NND 947030 By MD NARA Date 3/15/04

RG 337, Hq. Army Ground Forces
E. 108 (U.D.) AGF - AFF Instrs.
Box 51

(3) Office of the Post Range Officer.

(4) See paragraph 12.

3. RANGE CONTROL:

a. The Post Range Officer will control the range and will coordinate all firing on the Fort Jackson reservation.

(1) SMALL ARMS RANGES:

(a) The Assistant Post Range Officer at Leesburg will represent the Post Range Officer, with direct charge of all firing on Small Arms Ranges in the Leesburg area. An organization firing on the Small Arms Ranges will appoint a Range Officer to arrange for targets and other materials, also for posting Range Guards.

(2) ARTILLERY RANGE:

(a) The Battalion or similar units will detail one officer as Assistant Range Officer for the period when the battalion is firing on the artillery range. This officer will function as Assistant Post Range Officer with respect to artillery firing of his battalion. He will report to the Post Range Officer for instructions twenty-four (24) hours before each days firing.

4. RANGE DETACHMENT:

a. A permanent detachment will operate under the orders of the Post Range Officer. The Range Detachment will operate the Post Range Communications System. It will establish signs and road blocks as directed by the Range Officer and will keep range maps posted.

5. GOVERNING REGULATIONS:

a. The provisions of AR 750-10 will govern all firing. The provisions of appropriate Field Manuals will govern the firing of the particular weapons.

6. RANGE TELEPHONE SYSTEM:

a. Traffic diagram of the Range Telephone System is in the office of the Post Range Officer.

b. Tapping of circuits on the Range Telephone System at other than installed terminal strips, or cutting or rearranging of any installed circuit, is forbidden.

c. Requests for special circuits will be submitted to Post Range Officer one (1) day in advance.

d. Damage to telephone cables or metallic circuits on artillery range will be reported to Artillery Range Central immediately; damage to installations on Leesburg Range to Leesburg Range Office.

e. Permanent pole lines of the Range Telephone System will not be used by troops.

f. All field wire will be disconnected at the conclusion of each day firing.

7. ASSIGNMENT OF RANGES:

a. The general assignment of the Small Arms Ranges and the artillery ranges will be announced by Post Headquarters.

Authority NND 947030
By MD NARA Date 3/15/04

(1) SMALL ARMS RANGES:

(a) Requests for ranges will be submitted to the Post Range Officer.

(b) The organization assigned a small arms range will inform the Assistant Range Officer, Leesburg, of the calibers and ranges on which firing is to be conducted twenty-four (24) hours before firing is to begin.

(c) If small arms ranges are to be used for any other purpose than that for which they were constructed, requests will show the type of firing to be conducted.

(2) ARTILLERY AREA:

(a) The Post Range Officer will assign firing areas, will prescribe the limitations on firing therein, the safety limits, and any other restrictions necessary for safety.

(b) Requests for artillery range will be submitted to the Post Range Officer and accompanied by an overlay giving the following information:

Organization
Date and day of week
Hours of firing
Caliber
Ammunition
Gun Position
Impact area
Safety limits
Observation posts.

(c) Units, other than those normally assigned the Artillery Area, desiring to fire special problems will submit requests for firing areas to the Post Range Officer ten (10) days in advance of the proposed firing.

(d) Sentinels for enclosing the danger area will be furnished by units conducting fire and will be posted by the unit Range Officer under the direction of the Post Range Officer.

8. PUBLICATION OF FIRING SCHEDULE:

A WEEKLY FIRING SCHEDULE IS ISSUED BY POST HEADQUARTERS EACH TUESDAY MORNING AT 0800 COVERING ALL FIRING FOR THE SUCCEEDING WEEK. ALL REQUESTS FOR FIRING MUST REACH THIS HEADQUARTERS BEFORE 0800 TUESDAY.

9. DUTIES OF THE POST RANGE OFFICER:

a. The Post Range Officer is responsible for the coordination of activities on the range and for the safety of the entire range.

b. When requests for firing positions are submitted, the Range Officer will adjust any conflicts as to areas, check safety provisions, and will issue a firing memorandum prescribing the safety limits for each position.

c. When request for an area is submitted, the firing memorandum will define the area assigned. The officer supervising the exercise will prescribe safety provisions for each position in compliance with AR 750-10.

d. When required, in addition to the usual warning issued to personnel of the Post, announcement will be made in the daily papers, and Daily Bulletin.

e. The Post Range Officer is responsible for the posting of permanent signs on the reservation.

Authority NND 947030 By MD NARA Date 3/18/04

10. DUDS:

a. The Post Ordnance Officer is charged with the destruction of "duds" on the range.

b. "Duds" discovered on the range will be marked by stakes and reported to the Post Range Officer. Reports will show type of caliber of each "dud" location by coordinates, and the name, organization, and telephone number of any person familiar with its location. Artillery units conducting fire will report location of any suspected"duds" during the days firing.

c. Officers in charge of Mortar Firing will police range for "duds" at the completion of firing and report the locaion of all "duds" to the Post Range Officer. Officer in charge will sign certificate of clearance at Range Detachment Office regardless of whether there were any duds.

11. PERMANENT INSTALLATIONS:

a. Artillery firing will not be placed within 500 yards of permanent installations except dugouts.

b. All dugouts, except #5, are constructed against caliber 105-mm and less. Dugout #5 offers protection against 37mm and less.

c. Permanent roads, bridges, mockups, dams, and cemeteries, may be included in firing areas, but no adjustment will be made on such installations. Every precaution will be taken to prevent direct hits on such installations. Precautions will be taken to insure that firing will not endanger permanent telephone lines.

12. DANGER AREAS:

a. The size of the reservation and the nature of the terrain prevents the posting of guards to cover all approaches to danger areas. The danger areas will be marked by signs at points where sentinels are not posted. These signs will not be passed by personnel, except in the following cases:

(1) Personnel going to and from service firing on safe routes designated by the unit commander in charge of the firing.

(2) Officers, and parties accompanied by an officer, checking through the Range House and signing the range book. In this case, the officer accepts responsibility for a complete knowledge of the danger areas and of all firing in progress.

13. UNIT COMMANDER:

a. The Unit Commander is responsible that:

(1) Safety precautions prescribed in AR 750-10, regarding handling of ammunition and service of the piece are complied with.

(2) A red flag is displayed in a conspicious place in the vicinity of the battery position during firing.

(3) That all personnel of the battery are properly instructed as to safety precautions in general, and in particular as to the location of adjacent gun positions and sector of fire.

(4) When the shell is fired other than with bore safe fuses, or fuses considered in the category of bore safe, all personnel within the danger limits are protected as prescribed in paragraph 10, AR 750-10.

Authority NND 947030
By MD NARA Date 3/18/04

(5) The Range Central is promptly notified on completion of firing.

(6) The area used will be policed at the end of practice and all excavations will be refilled.

(7) He will not fire until he has been informed by the Assistant Range Officer from his unit that the range is clear, and will cease firing when directed by the proper authority.

PART II

SMALL ARMS RANGE

14. GENERAL INFORMATION:

a. The duties of the assistant Post Range Officer (SA) on the Leesburg Rifle Range, will be as follows:

(1) Maintain all ranges to insure proper operation.

(2) To furnish all target material the Table of Allowance prescribes.

(3) To turn over camp property to Organization Range Officer or Supply Officer on memo receipt.

(4) To see that the ranges are not abused and that all Government property is taken care of and used properly.

(5) To ascertain that no changes are made in safety angles for any range.

(6) To allow no changes to be made by using troops in any of the ranges.

(7) To permit no unauthorized use of ranges, such as firing weapons and ammunition not authorized for use on that particular range.

(8) Maintain and supervise the use of the camp and range utilities.

15. DUTIES OF ORGANIZATION (SA) RANGE OFFICER:

a. To take over the assigned ranges and camp facilities, including all the property and return same at end of firing period to the Assistant Range Officer (SA) in good serviceable condition.

b. To assign all targets, quarters and facilities to the using troops.

c. To furnish guards and transportation for posting the necessary guard to keep the danger area clear of personnel during the hours of firing.

d. To act as representative for the using troops in which case all requests made by using troops will be made to him only.

e. Report to Post Range Officer any facilities assigned and not being used.

16. SMALL ARMS RANGES:

a. Known Distance Ranges are designated as follows from the most westerly range (A) through east to the most northerly range (Y).

(A) 100 Machine Targets, 30 Caliber only.

(B) 30 Pistol Targets, 45 Caliber.

(C) 1 AA Range, 22 Caliber.

(D) 1 AA Range, 22 Caliber.

(E) 100 Pistol Targets, 45 Caliber.

Authority NND 947030
By MD NARA Date 3/15/04

(FG) 100 Rifle, 200 yards, 30 Caliber.

(HI) 100 Rifle, 100-200 and 300 yards, 30 Caliber.

(JK) 100 Rifle, 100-200 and 300 yards, 30 Caliber.

(LM) 100 Rifle, 200 yard, 30 Caliber.

(N) 4 sets Anti-Tank, 30 Caliber only.

(P) 50 Rifle, 100-200-300-500 yards, 30 Caliber.

(Q) Mortar 60 & 81mm.

(R) 100 Targets plain 1000", 30 Caliber.

(S) 1 set AA Targets, 200 Caliber only.

(T) 1 set AA Targets, 22 Caliber only.

(U) 8 sets of Landscape, 22 & 30 Caliber only.

(V) 25 Pistol Targets, 45 Caliber.

(W) 100 Machine Gun, 30 & 50 Caliber.

(X) 25 Pistol Targets, 45 Caliber.

(Y) 4 sets Anti-Tank, 22 Caliber.

b. Each range is distinctly marked by a large conspicious, designating letter. Also the type of ammunition to be used.

17. CONTROL AND SAFETY REGULATIONS:

a. Guards will be posted under the supervision of the Organization Range Officer, so as to provide safety during the hours of firing, unless otherwise requested.

b. When all guards are posted, red streamers will be raised on poles in rear of Ranges C-H and R. No firing will begin until these streamers are raised. All firing will cease when streamers are lowered. A change in these streamers will be preceded by a long blast on the siren located at the water tank connected to tower. With no streamer raised, the blast will indicate that the streamer is to be flown. A series of blast on the siren, after firing has begun will indicate that all ranges will cease firing immediately.

c. Each range will be operated under the senior officer in charge. Where pits are provided, the pits will be under the supervision of an officer. Range procedure will be followed as specified in training manuals, for the arm being fired.

d. Prior to firing, the officer in charge of a range will notify the pit officer who will order the streamer in pit to be raised when the pit is clear. Thereafter, no person will be allowed to stray from the pits, or leave the pits except by the authorized tunnels. Pit details will be instructed to operate and travel under the shelter.

e. An overlay will be furnished by Post Range Officer from time to time as to the location of the range guards. As the situation warrants, the location of these guards will change.

f. It will be the duty of the using troops to furnish one (1) non-commissioned officer and the guard for the range, and the duty of the organization (SA) Range Officer to ascertain that they are properly posted and instructed.

g. Ranges have been constructed to conform to Army Regulations for safety. Ranges will be used only for the purpose for which they were constructed (see paragraph 1). Special problems may be fired by arrangement with the Post Range Officer.

Authority NND 947030 By MD NARA Date 3/15/04

h. On all Combat Ranges and other Ranges beyond hearing distance of the siren at the water tank, the officer in charge of firing will communicate with the Leesburg Range Office to determine whether the Range Guards are posted and whether the Range is clear. At most of the Ranges, telephone communication is established with the Range Detachment. The officer in charge of firing will notify the Leesburg Range Detachment Office when firing is concluded each day.

i. The officer in charge of firing will be responsible that the range he uses is properly policed, targets are properly posted and replaced for the next day, and any repairs that cannot be made on the "spot" will be reported to the Range Detachment at the conclusion of the day's firing.

j. Combat Ranges 1-2-3-4-5-6 are designed for firing Infantry Squad and Platoon Problems with Caliber .30, ball ammunition. The safety limits are marked and the officer in charge of firing will see that all firing is within the safety limits.

k. These ranges will not be used for training areas or "dry run exercises" except by permission of the Post Range Officer.

l. No changes in the range installations will be made by troops using the ranges. No other than caliber 30 ammunition will be fired on combat ranges except by permission of the Post Range Officer.

m. The officer in charge of firing will inspect all pits before firing begins and if any are found to be unsafe he will have the necessary corrections made.

18. CARBINE TRANSITION FIRING will be conducted on Combat Ranges 2 and 5. Before the firing begins the officer in charge of firing will inspect all pits and if any are found to be unsafe he will have the necessary corrections made.

19. WOODS COMBAT COURSE: The officer in charge of firing will see that all possible precautions are taken to avoid accidents. Before giving the order to commence firing he will:

a. Ascertain that the range guard is posted.

b. That a red streamer is flying in the vicinity of the firing point.

c. That only M-2 ammunition or ammunition with a maximum range of 4000 yards is used.

d. That all personnel operating the targets are in the pits and understand the safety precautions.

e. That all explosive charges placed to represent enemy fire and all "Booby Traps" are prepared and exploded under the supervision of an officer.

f. That all troops are instructed in the safety angles of fire. The safety angle of fire is 35 degrees to the right and left of the long axis of the course.

g. The right and left sides and the finishing end of the course are marked by a single strand of barb-wire.

The officer in charge of firing will see that all problems are conducted within this enclosure and that all troops who have completed an exercise have been moved to the safety zone before the beginning of an exercise.

h. That all targets are repaired and that the range is in operating condition at close of firing.

i. That all personnel taking part in the exercise and all pit details wear the regulation steel helmet.

Authority NND 947030 By MD NARA Date 3/15/04

j. The officer in charge of firing will inspect all pits before firing begins and if any are found to be unsafe he will have the necessary corrections made.

20. INFILTRATION COURSES: The officer in charge of firing will see that all possible precautions are taken to avoid accidents. Before giving the order to commence firing he will:

a. Ascertain that the range guard is posted.

b. That a red streamer is flying in the vicinity of the firing point.

c. That machine guns have been properly laid and that the elevating and traversing stops are in their proper place to keep the fire at a minimum of 36 inches above the ground and within the bounds of the range.

d. That only M-2 ball ammunition or ammunition with a maximum range of 4000 yards is used. See par. 45d, AR 775-10, for regulations governing tracer ammunition.

e. That each gunner thoroughly understands the functions of the traversing and elevating safety stops.

f. That an officer is on the control tower at all times during firing and that he has proper means for immediately communicating with the gunner.

g. That all explosive charges placed to represent enemy fire, or "Booby Traps" be prepared and exploded under the supervision of an officer.

h. That all personnel taking part in the exercise and all pit detail wear the regulation steel helmet.

21. MOCK VILLAGE COURSE: The officer in charge of firing will see that all possible precautions are taken to avoid accidents. Before giving the order to commence firing he will:

a. Ascertain that the range guard is posted.

b. That a red streamer is flying in the vicinity of the firing point.

c. That only M-2 ammunition or ammunition with a maximum range of 4000 yards is used.

d. That all personnel operating the targets are in the pits and understand the safety precautions.

e. That an officer is on the control tower at all times during firing and that he has proper means of communication with all the pits from which targets are operated.

f. That all explosive charges placed to represent enemy fire and all "Booby Traps" are prepared and exploded under the supervision of an officer.

g. That all troops are instructed in the safety angles of fire. The safety angle of fire is 90 degrees to the right and left of the center line of the street.

h. That all targets are repaired and that the range is in operating condition at close of firing.

i. That all personnel taking part in the exercise and all pit details wear the regulation steel helmet.

j. That all pits be inspected before firing begins and if any are found to be unsafe he will have the necessary corrections made.

[redacted]
Authority NND 947030
By MD NARA Date 3/15/04

22. LIVE GRENADE COURTS: The Officer in charge of firing will:

a. Take all possible precautions to insure the greatest amount of safety to personnel.

b. See that all personnel not in trenches or behind masks are at least 250 yards from the impact area.

c. That all personnel in the trenches or behind masks wear the issue steel helmet.

d. That a guard is posted to prevent anyone from approaching within 250 yards of the impact area.

e. Designate an officer or non-commissioned officer with the necessary assistants to check for "duds".

f. Upon completion of firing, police the range and if any "duds" are not exploded they will be marked and a guard posted over them until arrangements are completed for their destruction. (See par. 10).

g. Before firing, a red streamer will be displayed from a pole erected for that purpose in rear of the center mask. This streamer can be drawn from the Post Range Officer on memo receipt.

REFERENCES:
FM 23-30 - AR 750-10 - TM 9-1900 - SNL-S-3.

23. SUB-MACHINE GUN RANGES, DISMOUNTED: The officer in charge of firing will:

a. Take all possible precautions to insure the greatest amount of safety to personnel.

b. See that all personnel not participating in the firing remain in the area immediately in rear of the firing positions.

c. That only the marked routes of approach to ranges are used in getting into ranges. (These ranges are close by other ranges and if other than marked roads are used men may wander into the danger area.)

d. These ranges have three firing points on each range. If adjacent firing points are being used, they will be used simultaneously. Men will advance from positions "A" to position "B" at a signal from the officer in charge of firing.

No scoring will be permitted when there is a man firing on an adjacent firing point.

e. At the close of firing for the day, targets and target material will be removed and stored in designated target house, the range will be thoroughly policed and any repairs that cannot be made will be reported to Assistant Range Officer - (Telephone Tie Line 12.).

24. SUB-MACHINE GUN RANGE, MOVING VEHICLE: The officer in charge of firing will:

a. Take all possible precautions to insure the greatest amount of safety to personnel.

b. See that all personnel not participating in the firing remain in the area immediately in rear of the firing positions.

c. That only the marked routes of approach to ranges are used in getting into ranges. (These ranges are close by other ranges and if other than marked roads are used men may wander into danger area.)

d. Vehicles will drive in the direction indicated by markers when firing.

e. No one will be permitted on the course after firing begins until the vehicle carrying the firing has completed the course and all weapons have been unloaded.

Authority NND 947030
By MD NARA Date 3/15/04

At the close of firing for the day targets and target materials will be removed and placed in designated target house, the range will be thoroughly policed, any repairs that cannot be made will be reported to Assistant Range Officer - (Telephone Tie Line 12.).

25. ANTI-TANK RANGE: Request will be made to Post Range Officer in same manner as for artillery range.

a. For the present time, only the following will be fired.

75mm sand loaded and armour piercing.
37mm armour piercing, (without windshields), sand loaded, and sub cal.
50 caliber machine gun.

b. The motor car and target car will be operated by personnel of the Range Detachment and under no circumstances by units firing. The car operator will set the car in motion and then report to officer in charge of firing that the range is clear and ready to be fired on.

c. A flag pole is available on the firing line. A red streamer will be flown when the range is being fired on. No firing will be permitted unless the red streamer is being flown. It will be the duty of the officer in charge of firing to cause the streamer to be hoisted and lowered. Before the car operator goes forward, the order cease firing and lower the flag will be given. Upon return from target car, the operator will report to officer in charge that range is clear and ready to be fired on. The officer in charge will order the flag to be hoisted and command begin firing.

d. The officer in charge of firing will furnish transportation for car operator to go to and from the target when adjustments are to be made on car and target.

e. There is a white post at each end of the firing line. Pieces that are to be fired will take up positions between these points.

f. Pieces that are merely for tracking purposes may be placed on an extension of the firing line.

g. There are two white poles 800 yards out with pieces of target cloth attached to the top which are to be used as right and left safety limits markers respectively.

h. The car is able to operate at two speeds, slow speed which is 5-15 miles per hour. Fast speed is from 5-25 miles per hour. The car operator will set the car at either speed the officer in charge of firing so desires. No other speed will be used except the above listed, without permission of the Post Range Officer.

26. TRANSITION RANGES: Before commencing to fire, the officer in charge of firing will inspect all pits and if any are found to be unsafe he will have the necessary corrections made.

27. RANGE SUPPLIES AND PROPERTY:

Ranges will be released to units when their authorized representatives have taken over the range property. This property will be maintained in good operating condition by the using unit. (Exception - broken targets, frames, etc., will be turned into the Range House for replacement.)

28. COMMUNICATION:

Phones for ranges will be drawn from the Assistant Range Officer. Phones may be exchanged for repair at Range Detachment.

29. CAMP AREA:

a. Requests for use of the Camp Area on the Small Arms Ranges will be submitted to the Post Range Officer.

Authority NND 947630 By MD NARA Date 3/15/04

b. When the Camp Area is assigned to an organization, the Commanding Officer of that organization or an officer designated by him will contact the Assistant Range Officer at Leesburg and will sign for all property on memo receipt. Obtain from the Assistant Range Officer a proposed administrative order to the using troops covering the interior economy of the camp.

c. Assignments in camp area will be made by Commanding Officer of using troops, and administrative arrangement for the camp area. Senior officer will command for coordination of installations.

d. Before departure, organization will:

(1) Roll sides of tents and loosen ropes.

(2) Stack all cots in mess halls for check.

(3) Scrub kitchen and mess halls.

(4) Clean ice box and leave open.

(5) Clean electric refrigerator; leave closed and connected.

(6) Skim grease trap.

(7) Remove all garbage.

(8) Scrub bathhouse.

(9) Scrub latrines, sprinkle lime in pits, and leave covers closed.

(10) Police area.

(11) Clean incinerator and haul rubbish to dump.

(12) Return property to Assistant Range Officer and get memo receipt.

e. When the Post Exchange is in operation in the camping area, the senior officer will issue orders regulating the hours and arranging for police and sanitary conditions. Post Exchange Officer should be informed of important changes or requests.

30. FACILITIES:

a. The following equipment and facilities for each company or similar unit is available:

(1) Mess hall and kitchen.
(2) Pyramidal tents.
(3) Cots, canvas, folding.
(4) One (1) bathhouse to three (3) mess buildings.
(5) One (1) latrine, pit type.
(6) Ice box and electric refrigerator.

b. The following equipment must be furnished by using troops:

(1) Field range.
(2) Cooking utensils.
(3) Mess kits, complete.
(4) Bedding.
(5) O. D. Blankets.

c. Water facilities are very limited. Arrangements must be made within organizations to conserve all that is possible and alternate the use of it between the kitchen and bathhouses when necessary. No water will be used for sprinkling streets.

d. During freezing weather the commanding officer of troops occupying the camp area will take all precautions to protect exposed water pipes.

Authority NND 947030
By MD NARA Date 3/15/04

31. SANITATION: The commanding officer of troops is responsible for sanitation and will appoint the senior medical officer as medical inspector for the camp and range.

32. RANGE FIRES:

a. The control of fires resulting from firing on the range is the responsibility of the officer in charge of firing.

When a fire on the range is observed, the officer in charge of firing on that range will immediately contact the Post Range Officer or his Assistant to determine the danger area.

If the fire is located inside a danger area, the Range Officer or the Assistant Range Officer will stop all firing in that area. The officer in charge of firing will then proceed to extinguish the fire.

b. Unit commanders in the vicinity of the fire will give assistance when called upon to do so.

c. During extremely dry weather when the danger of range fires is imminent, officers in charge of firing will inspect the impact areas of their ranges at the conclusion of each days firing.

By command of Brigadier General RICHART:

JOSEPH P. O'HARA
Major, AUS
Adjutant

ANALYSIS OF FORT JACKSON, SOUTH CAROLINA

GENERAL DESCRIPTION AND USE

Fort Jackson is located in the central part of South Carolina, 5 miles east of the city of Columbia (population 62,396). The reservation comprises an area of 60,217 acres of which 51,344 acres are Government-owned. From June 1940 to October 1944, a total of 8 Infantry Divisions received training for primary missions at this post. During the year 1942 the training of four Infantry Divisions was prosecuted at one time. Besides acting as a training post for infantry divisions, Fort Jackson has also been used for the training of miscellaneous tactical groups and service battalions.

REGIONAL FACTORS

Other nearby centers of population are: Sumter, 45 miles distant, (population 15,874), and Orangeburg, 50 miles distant (population 10,521). The proximity of Fort Jackson to the city of Columbia is very advantageous from the viewpoint of social outlets. The climate is moderate. The health of the troops is protected from mosquitoes by adequate drainage within the housing area, principal recreation areas, and for a one-mile strip surrounding these areas. Beyond the limits of the controlled area, mosquito breeding grounds are extensive and require the application of standard measures of malaria control. The area surrounding Fort Jackson is primarily an agricultural community.

POST DEVELOPMENT

In the cantonment area, based upon 80 square feet per man, there is available space for 19,714 men in mobilization type barracks. There have been housed 43,690 men in hutments and 2,198 in theater of operations type barracks. There are no permanent quarters. It would be desirable in the postwar period to convert the present hand fired space heaters and hot water heaters to automatic firing. Present housing conditions with respect to fire prevention are satisfactory.

The water supply system is constructed of permanent materials and is considered satisfactory for postwar use. The supply is from a dam on Gill Creek, treated in a water filtration plant, and is adequate and dependable.

The sewage disposal facilities are constructed of permanent materials and are considered very satisfactory and suitable for postwar use. Complete treatment is provided and therefore no nuisance is created.

Cold Storage facilities are adequate for postwar use.

The electric power is furnished by the South Carolina Gas and Electric Company. Service is excellent and supply adequate. No standby supply is provided. The last monthly billing of energy use was .7719 cents per KWH.

R E S T R I C T E D

DECLASSIFIED
Authority 803038 NRD
By CB NARA Date 3-24-04

Fort Jackson, South Carolina

Rail service is furnished by the Atlantic Coast Lines, the Southern Railway and the Seaboard Air Lines over jointly operated tracks. Switching operations within the warehouse area are increased due to the fact that ten to twelve warehouses must be served by a single track. Three general supply depots are within 150 miles of the camp.

Highway access adequately serves Fort Jackson. The roads and drainage within the post are satisfactory for postwar use.

The total cost of Fort Jackson to the Government since July 1, 1940, including land and construction, has been approximately $31,078,000.

TRAINING FACILITIES

The general soil characteristic of the reservation is sand and sandy loam. Water is absorbed quickly and troops can drill a few minutes after a normal rainfall.

All training aids, except small arms ranges, are located within a maximum of thirty minutes' marching time of the housing area.

Small arms ranges are located sixteen miles from the housing area. A tent camp sufficient to accommodate 6,000 troops is located within an average marching time of thirty minutes of all small arms ranges. Troops using these ranges train progressively and usually remain at the tent camp until all small arms training is completed. No loss in training time is incurred by the location of the ranges.

The artillery ranges afford excellent ground observation of impact area in open ground. Maximum range is 18,000 yards.

The maneuver areas include well proportioned open and wooded areas and are very suitable for training. The wooded areas are accessible to all types of motor and tracked equipment.

Sufficient drill fields are located near small units and allow 60% of the troop strength to use the areas at any one time. A division review field is also available.

There are two air strips located on the reservation for the operation of L-2 (Artillery Liaison) Planes. Land is available for expansion of these strips. There are two Army airports in the vicinity. One is the Columbia Army Air Base, approximately 18 miles from the post having 3 - 5,000' runways evaluated for 30,000 pounds capacity operation, 40,000 pounds limited operation. The second airport is Congaree, approximately 10 miles from Fort Jackson, having 3 - 4,500' runways, evaluated for 40,000 pounds capacity operation, 74,000 pounds limited operation.

Engineering training is available for floating and fixed bridges.

DECLASSIFIED
Authority NND 803038
By CB NARA Date 8-24-04

Fort Jackson, South Carolina

Tank deployment training facilities are satisfactory.

CONCLUSION

From an engineering standpoint, Fort Jackson may be considered satisfactory for postwar retention except in the matter of housing. There is a discrepancy of 13,136 between the available space in mobilization type barracks and the proposed strength of 32,850. Based upon the assumptions given in the attached appendix, the cost of providing permanent quarters for the officer complement, quarters for the first three grades of W.C.S.'s, additional barracks, and remodeling the existing mobilization type barracks for postwar use would be in the neighborhood of $55,000,000.

NND 803038
Authority
By CB NARA Date 8-4-04

APPENDIX A

Assumptions on Basis of Which Estimated Costs Were Made

In the absence of determined policy as to types of construction to be used, ace allocation for different kinds of structures, method of housing married ficers and top-grade non-commissioned officers, etc., the following assumptions ve been used in preparing the housing costs given in the preceding conclusion:

(1) That Theater of Operations construction, hutments, and tents would be disposed of, that only permanent or mobilization-type construction would be retained, and that mobilization-type construction would be improved to supply facilities suitable for permanent occupancy.

(2) That all new construction with the exception of extensions or additions to existing mobilization-type construction would be of permanent construction.

(3) That station hospitals, being normally of mobilization-type construction or better, would not usually require more than nominal expenditure for conversion to permanent use. (Estimates do not include this conversion cost.)

(4) That officer strength at a given post is roughly 5% of the total complement assigned to the post.

(5) That all officers at regular army stations and all regular army cadre officers serving as trainers at other types of posts would be provided family housing.(This applies to married officers only.)

(6) That all trainee officers will be provided bachelors' officers quarters. (National Guard and Reserve Camps would have no family quarters.)

(7) That top three grades of non-commissioned officers to be housed in family quarters comprise 2.2% of the total complement assigned to the post.

(Above percentages are based roughly on the Table of Organization for an Infantry Division and check fairly closely with the actual conditions of housing at seven pre-war permanent posts.)

(8) That existing housing given in "War Department Owned, Sponsored, and Leased Facilities" would accommodate only 75% of rated capacity, since capacities given in this publication (30 June 1945) are based on 60 square feet per man, while allocation approved for planning is 80 square feet per enlisted man. (Costs of new permanent family housing takes into account existing permanent family housing as given in Historical Records.)

Authority 803038 NND
By CB NARA Date 3-14-04

Based on the above assumptions and on the best available information, the following rough approximations of unit costs of housing were used:

(1) For remodeling mobilization type barracks and other related buildings, including necessary minimum improvements of roads, utilities, etc. . . . . $. 300.00 per S.M.

(2) For new permanent housing, replacing Theater of Operations structures, tents, and hutments, and including a proportional share of other facilities (buildings, utilities, etc.). . . . $ 2,000.00 per S.M.

(3) For new permanent officers' family housing (field and company grades averaged), including roads, utilities and other necessary miscellaneous community facilities, such as schools, club, etc. . . . . $10,320.00 per Officer

(4) For new permanent apartment quarters for bachelor officers, including same as above . . . . . $ 3,000.00 per Officer

(5) For new permanent family quarters for Warrant officers and top-grade N.C.O.'s, including roads, utilities and other miscellaneous community facilities such as schools, club, etc.. . $14,770.00 per man

REPRODUCED AT THE NATIONAL ARCHIVES

HEADQUARTERS
RANGE & TRAINING AIDS DIVISION
Fort Jackson, South Carolina

25 April 1947

SUBJECT: Construction of Ranges.

TO : Post Engineer, Fort Jackson, S.C.

1. Request the construction and rehabilitation of the following Ranges, to meet the training requirements set forth in the Military Training Program of Hq. Army Ground Forces, annex # 3 Sec. 2 Dated 1 Feb. 47, as follows.

2. Transition Range as in plan number OCE # 1600-200. This range is to consist of 6 #6 lanes, 4 #7 lanes, 1 #8 lane. The firing line is to be located at coordinates, 1008.40-1212.00, Map Ft. Jackson and Vicinity 1:25,000 compiled form reservation map Ft. Jackson, dated, 3 May 43.

3. Techinque of Fire Range, to be constructed in accordance with OCE plan # 1600-110, consisting of 4 panels, 5 targets per panel. The firing line to be located at coordinates, 1009.30-1214.60, Map Ft. Jackson and Vicinity S.C., 1:25,000 , Compiled from reservation map Ft. Jackson, dated, 3 May 43.

4. Field firing Range, to be constructed in accordance with OCE plan # 1600-140. Firing line to be located at coordinates 1009.35-1214.30. Map Fort Jackson and Vicinity S.C., 1:25,000, compiled from reservation map Ft. Jackson, dated 3 May 43.

5. Rehabilitation of existing hand grenade court located at coordinates 1008.35-1217.00. Map Fort Jackson and Vicinity S.C.,1:25,000, compiled from reservation map Fort Jackson, dated 3 May 43. Rehabilitation consists of replaceing sand bags, duck boards and other minor repairs.

6. Rifle Grenade Range, to be constructed in accordance with diagram, Figure 44, page 114, FM-23-30. To be located at coordinates, 1007.50-1216.50 Map Fort Jackson and Vicinity SC., 1:25,000, compiled from reservation map Ft. Jackson, dated, 3 May 43. Rocket Launcher Range can be combined in with the Rifle Grenade Range, with very little additional expense and materials.

7. It is necessary that the construction of these ranges be given top prority, as the 13 week Training cycle starts 5 May 47 and all ranges are used from the 5th. to the 8th. week of the Training cycle. Ranges must be completed prior to 23 June 47.

8. This request is based on the Training of approximately 10,000 troops.

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3.22.04
Reproduced at the National Archives

(1) The range is in proper mechanical condition for firing.

(2) The ambulance and qualified aid men are present.

(3) Range guards have been oriented and posted properly.

(4) The range has been scheduled and notice of firing placed in the Daily Bulletin.

(5) No situations have arisen that would make firing contrary to safety precautions.

7. During Use of Range by Using Units:

a. Range Supplies and Equipment: The Post Range Officer will furnish all requisite range supplies for specific ranges upon request for range supplies from the using unit.

b. On-the-spot Maintenance: The Post Range Officer will be responsible for continuous maintenance, during firing, of target frames, target devices and communication lines.

8. After Use of Range by Using Units:

a. Final Clearance: The Post Range Officer will be responsible for issuance of a written clearance of the range upon request by the using unit. Prior to the issuance of this clearance, he will personally, or by a commissioned officer or non-commissioned officer representative, ascertain that:

(1) The range proper is in an acceptable state of police.

(2) The condition of range facilities is the same as when accepted by the using unit.

(3) All non-expendable range supplies and equipment are turned in by the using unit and that expendable range supplies in excess of those used by the using unit are also turned in.

(4) The using unit has checked for range fires and duds.

b. Necessary Repair: The Post Range Officer will be responsible for making all necessary repairs. He will also be responsible for proper notification of the Post Engineer or Post Signal Officer for repairs of such nature as to require their aid.

Section III
Responsibilities of Officer in Charge of Firing

9. Before Using Range:

a. The Officer in Charge of Firing will be responsible for having personal knowledge of, and having the operation of ranges in compliance with, pertinent provisions of:

AR 750-10

Pertinent Technical Manuals and Field Manuals.

Chapter III below.

He will also be responsible for the dissemination of, and compliance with, the information contained in the pertinent provisions of the above references for all supervisory personnel.

b. The Officer in charge of firing will be responsible for notifying the Post Range Officer in the event firing is cancelled for any reason.

DECLASSIFIED
Authority NND 997000
By CO NARA Date 3-22-04

(2) On The Firing Line:

(a) The organization of personnel on the firing line will be so arranged as to adapt the using unit to the course to be fired.

(b) The organization of personnel on the firing line will be so arranged as to make the most efficient use of the time allotted.

(c) An officer will be present on the firing line at all times.

(d) Safety precautions will be followed at all times, including the following:

1. Weapons will be pointed "down range".

2. Weapons will be cleared and placed in the "safe" firing position when not in operation.

3. "Cease firing" will be given at any time when a condition arises which in anyway precludes the continuation of safe firing.,

4. Firing, limited to designated firing lines or areas and between designated limiting points, will be observed at all times.

5. No one will move from the firing line in the direction of the impact area until all weapons have been cleared and placed in the "safe" firing position.

6. No firing will be conducted when the scarlet streamer is not displayed on the range pole.

7. In case of an accident, such as the bursting of a barrel, or permanent damage to the weapon, the weapon will be left in the position in which the accident occured and the Ordnance Officer, Ft Jackson, notified.

8. If any serious malfunction of Ordnance equipment occurs on the range, such equipment will be turned over promptly to the Ordnance Officer without effort to repair it.

(3) Pits (where applicable):

(a) Organization:

1. Scheduling personnel as target operators in pits should be so arranged as to not interfere, or to cause an unnecessary break in firing.

2. Personnel should be rotated as frequently as is consistent with the efficient operation of the range in the performance of duties as target operators in the pits.

(b) Safety:

1. Each pit will have a red flag, which flag is to be waved during firing, only when for some necessitous reason or emergency (except on the KD range), a target operator must have the firing line "cease fire" in order to emerge from pit.

DECLASSIFIED
Authority NND 947000
By NARA Date 3-22-04

2. No target operator (s) will emerge from a pit or expose himself to fire until specific orders have been issued on the firing line to "cease fire" and "clear all weapons" and specific approval given to the target operator (s) to expose themselves.

3. The red flag will be exhibited from a prominent position in a pit during the entire time a target operator is exposed.

(4) Impact Area: Firing will be halted in the event:

(a) A range fire is detected on the range at any time. In which event the following procedure will be used:

1. Notify the Range Officer to obtain clearance to enter the impact area.

2. If the range fire is limited and clearance has been received extinguish fire with personnel and facilities available.

3. If the fire is large and clearance has been obtained or if possibility of its becoming large exists:

a. Use personnel and facilities available in attempt to prevent spread of fire, and if possible, extinguish it entirely.

b. Notify Post Range Officer that assistance will be required.

(5) Miscellaneous: All immediate repairs necessary will be reported to the Range Officer for action.

11. After Use of Range: The Officer-charge-of-firing will be responsible, upon completion of firing to:

a. Check for all range fires detected on the range, using the same procedure as in par 10 a (4) above, in the event one is discovered.

b. Check for, and report duds (where applicable) as follows:

(1) Appoint a limited number of responsible, experienced, non-commissioned officers to conduct a search for duds.

(2) Leave the suspected dud undisturbed.

(3) Mark the location by a dud marker (Note: Dud markers, 10" red discs with DUD marked in white letters, placed on 6 foot pole, are located in all target houses).

(4) Report the exact location by coordinates to the Post Ammunition Officer (tel 24). If Post Ammunition Officer indicates that he will investigate immediately, leave someone nearby to guide him to the exact location.

c. Police the entire range site for trash.

d. Conduct a search of all personnel for live ammunition.

e. Turn in all supplies, drawn specifically for range firing, to same agencies drawn from (See par 9 c, above).

f. Execute the following certificate (issued with all Ammunition) for all HE ammunition expended:

c. Upon completion of the record practice or examination, score cards or a report from examining boards will be transferred to the Headquarters of the unit, where the order of classification will be published----------".

CHAPTER - III
Detailed Information and Responsibilities for Specific Ranges

SECTION I

Machine Gun Range #1

12. Description:

a. Location: (1007.7 - 1214.9) See Annex #1.

b. Telephone Numbers: Tie Line 14 Ring 1.

c. Number of Firing Points: 60

d. Type Weapon Fired: Machine Gun Cal..30, Light (M1919A4)
Machine Gun Cal..30, Heavy (M1917A1)

e. Course to be fired on range: A or B (modified to 500" range).

f. Distance from gun position to target: 500 inches.

g. Safety Limits: See Annex #1.

h. Danger Area: See Annex #1.

DECLASSIFIED
Authority NND 947020
By NARA Date 3-22-07

i. Range Guard Positions: None necessary.

j. Available Range Facilities:

(1) Control Tower

(2) Covered Latrine

(3) Dry Firing Line with 60 Targets

(4) Mess Hall

(5) Scoring and Critique Tables

(6) Supply House

(7) Target House

k. Type Target: 500 inch Machine Gun.

13. Responsibilities of Post Range Officer:

a. Continuous responsibilities: The Post Range Officer is responsible for the maintenance of all range facilities mentioned in par 12 j, above.

b. Before Use of Range by Using Unit: The Post Range Officer is responsible for supplying using units with 500 inch Machine Gun targets and target frames.

14. Responsibilities of Officer-in-charge-of-firing:

a. Before Use of Range: The Officer-in-charge-of-firing will be responsible that:

(1) Both he and his supervisory personnel are thoroughly familiar with pars 110-122, FM 23-55, and AR 750-10.

(2) All firers have completed, as a minimum requirement, all mechanical training, gun drill and marksmanship, required by SOP 27 Hq 5th Inf Div. Requests for waiver of this prerequisite instruction will be submitted to this Headquarters ATTN: GNJDT, one week prior to actual firing.

(3) Prior to Firing:

(a) An officer will check headspace of each gun and make the proper adjustment.

(b) A cleaning rod and dry patch is run through the bore of each gun.

b. During Use of The Range:

(1) Operation of The Range:

(a) Behind the firing line (Opposite side of firing line from impact area): The Officer-in-charge-of-firing will be responsible that before removing a machine gun from its firing position, or from the firing line, each gun will be inspected, by an officer to see that it is unloaded. As part of this inspection, a cleaning rod will be passed completely through the barrel of each gun.

DECLASSIFIED
Authority NND 947030
By CO NARA Date 3-22-04

(b) On The Firing Line:

1. The most efficient organization, for this range consists of a breakdown into 5 equal sized orders as outlined below:

1 Order	Gunner	Wet Line
1 Order	Asst Gunner	Wet Line
1 Order	Observer	Wet Line
1 Order	Gunner	Dry Line
1 Order	Asst Gunner	Dry Line

2. Safety Precautions: The Officer-in-charge-of-firing will be responsible for the accomplishment of the following safety precautions: Note: The "Safe firing position" referred to in par 10 a (2) (d) 2 "Safety Precautions" will be considered to have been attained for the machine gun when:

a. A cleaning rod has been passed completely through the barrel.

b. A clearing block has been placed in the receiver of the gun.

(c) A clearing block should be inserted in the receiver of each gun during the time it is not being used to fire an exercise.

(d) All decisions as to actions to be taken on stoppages will be made by an officer.

c. After Use of Range: The Officer-in-charge-of-firing will be responsible that all trash accumulated in the trash bin is burned in the metal receptacles provided for that purpose.

SECTION II

ROCKET LAUNCHER RANGE

15. Description:

a. Location: (1007.7 - 1216.4).

b. Telephone Number: Tie Line 15, Ring 3.

c. Number of Firing Points: 24

12 Practice Ammunition
12 Service Ammunition

d. Type of Weapon Fired: Rocket Launcher, 2.36 inch M9 and M9A1.

e. Distance from Gun Position to Target: 100 Yards.

f. Safety Limits: See Annex #1.

g. Danger Area: See Annex #1.

h. Range Gaurd Positions: None Necessary.

i. Available Range Facilities:

(1) Range House.

(2) Dry Firing Line with 12 Targets.

(3) Control Tower.

DECLASSIFIED
Authority NND 997030
By NARA Date 3-22-04

f. After use of the range: The officer-in-charge-of-firing will be responsible that all trash has been policed.

SECTION IV

TRANSITION RANGE

21. Description:

a. Location (1008.7-1212.3)

b. Telephone Number - Tie Line 11.

c. Number of firing lanes: 15.

6 Lanes (1 through 6) - Table VI.
4 Lanes (7 through 10) - Table VII.
1 Lane (11) - Table VIII.
4 Lanes (12 through 15) - Table IX.

d. Course to be fired:

Table VI and VII - Par 69d FM 23-5
Table VIII - Par 69d FM 23-5, C2
Table IX - as follows:

PHASE LINES	TARGETS SINGLE	DOUBLE	TRIPLE	RANGE (YARDS)	SHOTS	TARGET	POSITION	SLING
2 - 3	2	1	0	5-70	4	E	Off Hand	None
3 - 4	0	1	2	5-70	8	E	Hip	None
4 - Final	2	3	0	5-70	8	E	Off Hand	None

(1) A single silhouette represents an enemy rifleman. A double silhouette represents an enemy automatic rifle team. A triple silhouette represents a machine gun.

(2) Targets will be exposed in sequence upon signal from the coach. Time of exposure of targets is as follows: (a) Single silhouettes, 3 Seconds. (b) Double silhouettes, 4 seconds. (c) Triple silhouettes, 5 seconds.

(3) Phase lines are placed after the 4th, 12th and 20th targets to assist in the enforcement of safety precautions.

e. Scoring and satisfactory scores:

TABLE	SCORING PROCEDURE	SATISFACTORY SCORES
Table VI & VII	Par 69e, (1) & (2), FM 23-5.	VII - 8
Table VIII	Par 69e (3), FM 23-5, C2	4
Table IX	1 for each target hit	8

f. Type of weapon fired: Rifle Cal .30, M1.

g. Distance from firing position to target:

Table VI - 200, 300, and 500 yards.

Table VII - 250, 300, 350, 400, 450 & 500 yards.

Table VIII - 100 yards.

Table IX - 5-70 yards.

DECLASSIFIED
Authority NND 947000 By NARA Date 3-22-04

h. Safety Limits: See Annex #1

i. Danger Areas: See Annex #1

j. Range Guard Positions:

POSITION	DUTIES
1008.6-1211.2	- Block all traffic moving into transition range danger area.
1009.1-1213.4	- Block all traffic moving Southeast on Hartsville Guards Road and all other traffic seen moving into transition range danger area.
1009.6-1211.3	- Block all traffic moving North into the transition range danger area.
1013.3-1210.1	- Block all traffic moving North along Telephone Road.
1014.5-1217.6	- Block all traffic moving South along Telephone Road.

k. Available range facilities:

(1) 6 Control towers

(2) Latrines

(3) 3 Bleachers (Capacity 50 each).

(4) Target House

(5) Work Tables

(6) Communication Arrangement (See Annex #2).

22. Responsibilities of Post Range Officer:

a. Continuous responsibilities: The Post Range Officer is responsible for the maintenance of all range facilities mentioned in K above.

b. Before use of range by using unit: The Post Range Officer is responsible for supplying using units with a sufficient number of [illegible] silhouettes, including those colored Red [illegible] yard firing, and also a sufficient number of target staves for the entire period of firing.

23. Responsibilities of Post Signal Officer:

a. Before use of range by using unit: The Post Signal Officer (Tel 10) will be responsible, upon requests by Regimental S-3's to advise the units as to use of cable facilities and to restore inoperative cable facilities.

b. During use of range by using unit: The Post Signal Officer will be responsible, upon request of Regimental S-3's, for repairing broken wire communication facilities.

c. After use of range by using unit: The Post Signal Officer will be responsible, upon request by the Post Range Officer, to make any necessary repairs.

24. Responsibilities of Officer in Charge of Firing:

DECLASSIFIED
Authority NND 947000
By CO NARA Date 3-22-04

a. Before Use of Range: The Officer in Charge of firing will be responsible that:

(1) Both he and supervisory personnel are thoroughly familiar with pars 34, 69d, e, f, g, 189-191b FM 23-5, C1 and 2, and AR 750-10, and SOP 24A.

(2) All firers have fired the rifle qualification Course "B" and also have received instruction in range estimation, assuming firing position and assault fire, required per SOP 24A, Hq 5th Inf Div. Requests for waiver of this prerequisite instruction will be submitted to this Hq, ATTN: GNJDT, one week prior to actual firing.

(3) Range Guards are posted in positions listed in 21 j above.

(4) When pits are filled with water they are bailed out prior to firing and that every third pit has a bucket available for any subsequent seepage into the pits.

(5) The first pit detail is familiarized with its duties and have at least one "dry run" prior to actual firing.

b. During use of Range: The Officer in charge of firing will be responsible for the overall operation of the range to include:

(1) Behind the firing line (opposite side of firing line from impact area).

(a) Only weapons that have been unloaded, locked, and have had a cleaning rod run through the bore, will be permitted to be removed from any firing point or firing line.

(b) Movement in rear of firing points by personnel undergoing this course, will be at a walk with rifles held at "Port Arms".

(2) On the firing line:

(a) Procedure for firing: As outlined in SOP 24A.

(b) Organization of firing line: As outlined in SOP 24A.

(d) Safety:

1. The safe firing position referred to in par 10 a (2) (d) 2, "Safety precautions" will be considered to have been attained when:

a. Rifle is locked.

b. Ammunition completely removed from rifle.

c. Bolt to rear.

d. A cleaning rod has been run through the bore of the rifle.

2. Safety Precautions: For Table IX.

The firer will be instructed prior to firing that targets are not more than 3 feet in size, targets will be on same level as ground, targets to front, right or left front only.

DECLASSIFIED
Authority NND 947030
By CO NARA Date 3-22-04

The Coach Cadre will:

Stay immediately in rear of firer.
Regulate speed of movement of firer.
Keep target operator well in rear of firer.
Determine that firer has unloaded his weapon before moving back to starting point.

(d) Communication: The firing point on each firing lane will maintain contact with the pits in its own lane by the use of field telephones.

(3) Pits:

(a) Organization: Pit details subsequent to the 1st order will be thoroughly instructed in their duties and also in safety precautions to be observed before being assigned to pits.

(b) Communication: Each lane within each of the 4 tables, will have its own integral communication net by which control will be exercised, as follows:

TABLE VI: The center pit at each of the three ranges (200, 300, 500 yds) will have a terminal for telephone communication to the firing point.

Communication between any of the three pits located at one of the three ranges may be established by use of whistles signals. Suggested signals are as follows:

"Attention" 4 short blasts

"Targets Up" 1 long blast

"Targets Down" 2 long blasts

"All Clear" 2 short blasts

TABLE VII: Each pit at each of the six different ranges (200, 250, 300, 350, 400, &450 yds) will have a terminal for telephone communications to the firing point.

TABLE VIII: The pit will have a terminal for telephone communication to the firing point.

(c) Scoring: Scoring will be accomplished by pit detail as follows:

TABLE VI: Flutter and lower target when hit then score.

TABLE VII: Same as above.

TABLE VIII: Score after command "Targets Down" is given.

TABLE IX: Not applicable (See par 21d & e, for scoring).

(d) Safety: See par 10, (2), (a) 2 "Safety".

e. After use of Range: The officer in charge of firing will be responsible:

(1) That all trash accumulated in trash bins is burned.

(2) That new targets are fastened on all staves and then stored in target house for the use of the next unit.

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3-22-07

5. See that there are no burs on the rings of the grenade launcher, and that the rings are free from grit.

6. Inspect frequently the wing nut on the clamp of the launchers M1, M2, and M8 to insure that it is tight.

7. Never place a grenade on the launcher unless it is intended to fire it immediately. Never fire service ammunition or standard blank ammunition when grenade is on the launcher.

8. If the hand grenade with the grenade projection adapter should accidently become armed after the removal of the safety pin, unlock the weapon and fire immediately as the grenade will explode in 4 to 5 seconds. Care should be taken not to strike the lever after the safety pin is removed as such action may cause the lever to spring from the grenade and allow the fuze to function.

9. Do not drop a grenade after the safety pin has been removed.

10. In the event the rifle grenade cartridge M3 or carbine grenade cartridge M6 does not fire and there are no additional M3 or M6 cartridges available., lock the weapon, replace the grenade safety pin, and remove the grenade.

11. Do not recover or tamper with live grenades, once fired, that fail to fire.

c. After use of the Range:

(1) Execute a certificate for all HE ammunition expended (see par 11f for example of certificate).

(2) Police all trash

SECTION VIII

PISTOL RANGE

34 Description:

a. Location (1008.8-1214.9)

b. Telephone Number Tie Line 14 Ring 4

c. Number of Firing Points: 10

d. Type weapon fired: Automatic pistol, Cal..45 M1911 or M1911A1 Colt Revolver, cal..45 M1917.

e. Courses to be fired as prescribed in pars 87-90 FM 23-35

f. Distance from firing line to targets: 15 and 25 yards.

g. Safety Limits: See Annex #1.

h. Danger Area: See Annex #1.

i. Range guard positions: None.

j. Available Range facilities.

Target House
Latrine (to be used in conjunction with latrine on MG Range #2).
Pistol Butts

DECLASSIFIED
Authority NND 947000
By CO NARA Date 3-22-04

35. Responsibilities of Post Range Officer:

a. Continuous responsibilities: The Post Range Officer is responsible for the maintenance of all range facilities mentioned in 34 j above.

b. Before use of range by using unit: The Post Range Officer is responsible for supplying using units with sufficient numbers of E&L type targets.

36. Responsibilities of officer in charge of firing:

a. Before use of range: The Officer in charge of firing will be responsible that:

(1) Both he and his supervisory personnel are throughly familiar with pars 13, 24, 25, 91, 96 FM 23-35 and AR 750-10.

(2) All firers have completed as a minimum requirement, all mechanical training and marksmanship training listed in FM 23-35. Requests for waiver of this instruction will be submitted to this headquarters ATTN: GNJDT one week prior to actual firing.

(3) All pistols have had safety devices tested per par 25.

All revolvers have had safety devices tested per par 64.

b. During use of range:

(1) Behind the firing line (opposite side of firing line from impact areas).

(a). Only weapons that have been unloaded, locked and have had a cleaning rod run through the bore will be permitted to be removed from the firing line.

(b). All weapons will be carried at the "Raise Pistol" position.

(2) On the firing line:

(a). Procedure for firing: As outlined in pars 94e FM 23-35.

(b). Organization: As outlined in par 94a and d FM 23-35.

(c). Safety: For pistol cal .45 M1911 or 1911A1.

1. When units carrying the pistol are first formed the officer or noncommissioned officer in charge causes the men to execute "Inspection Pistol".

2. The safe firing position referred to in par 10a (2) (d) 2. "Safety precautions" will be considered to have been attained when the weapon is unloaded, the magazine has been removed and the slide has been locked in the rearmost position with the slide stop.

3. Execute unload every time the pistol is picked up for any purpose. Never trust memory. Consider every pistol as loaded until it has been proven otherwise.

4. Always unload the pistol if it is to be left where someone else may handle it.

5. Always point the pistol up when snapping it after examination. Keep the hammer fully down when the pistol is not loaded.

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3-22-04

6. Never place the finger within the trigger guard until it is intended to fire or to snap for practice.

7. Never point the pistol at anyone.

8. Before loading the pistol, draw back the slide and look through the bore to see that it is free from obstruction.

9. On the range, do not insert a loaded magazine until the time for firing.

10. Never turn around at the firing point.

11. On the range, do not load the pistol with a cartridge in the chamber until immediate use is anticipated. If there is any delay, lock the pistol and only unlock it while extending the arm to fire. Do not lower the hammer on a loaded cartridge; the pistol is much safer cocked and locked.

12. In reducing a jam first remove the magazine.

13. To remove a cartridge not fired first remove the magazine and then extract the cartridge from the chamber by drawing back the slide.

For Revolver Cal..45:

14. The safe firing position referred to in par 10 a (2) (d) 2 "Safety precautions" will be considered to have been attained when the weapon is unloaded, the cylinder is opened and the safety has been placed in a safe position.

15. Execute unload every time the revolver is picked up for any purpose. Consider every revolver as loaded until proven otherwise.

16. Always unload the revolver if it is to be left where someone else may handle it.

17. Always point the revolver up when snapping it after examination. Keep the hammer fully down when the revolver is not loaded.

18. Never place the finger within the trigger guard until it is intended to fire or to snap for practice.

19. Never point the revolver at anyone. On the range do not snap for practice while standing back of the firing line.

20. Before loading, open the cylinder and look through the bore to see that it is free from obstruction.

21. Never turn around at the firing point.

23. On the range do not cock the revolver until immediate use is anticipated. If there is any delay, lower the hammer and recock it only when ready to fire.

24. If the revolver fails to fire, open the cylinder and unload if the hammer is down. If the hammer is cocked or partly cocked, a breakage has occurred. In this case hold the revolver at raise pistol and announce the fact to the officer in charge.

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3-22-04

25. To remove a cartridge not fired, open the cylinder and eject, first lowering the hammer if cocked.

(d) After Use of Range: The Officer in Charge of Firing will be responsible that all trash has been policed.

SECTION IX

ARTILLERY RANGE

37. Description:

a. Location: Gun Position (Center of Gun Position):

"A" - (1014.0-1211.3)
"B" - (1015.3-1214.8)
"C" - (1011.2-1210.4)

Impact Area (Center): (1019 - 1214)

b. Telephone Number: (Weir Tower) Tie Line 10.

c. Type Weapon Fired: 105mm and 155m Howitzer.

d. Safety Limits: See Annex #8.

e. Danger Area: See Annex #8.

f. Range Guard Positions: (See Annex #8)

For Impact Area: All road guards on the numbered road guard positions will prevent entry into the impact area.

When firing from gun position "A" the following additional guards will be posted in addition to impact area road guards: RG-A (1013.0-1210.0) allow only authorized traffic to proceed North along Telephone Road.

When firing from gun position "C" the following additional guard will be posted in addition to impact area road guards: RG-C (1011.2-1209.5) allow only authorized traffic to proceed North along Telephone Road.

When firing from gun position "B": Only impact area road guards will be posted.

38. Responsibilities of Officer in Charge of Firing:

a. Before Use of The Range: The Officer in Charge of Firing will be responsible that:

(1) Both he and his supervisory personnel are thoroughly familiar with Section I, Appendix I, FM 6-40 and FM 6-140, FM 6-75 (105mm Howitzer) FM 6-81 (155mm Howitzer) and AR 750-10.

(2) The following minimum number of personnel are designated:

1 Officer - Commanding Officer of Unit Firing.
1 Safety Officer at each Battery Position.
EM Range Guards as needed (See a.6. above).
1 EM Telephone Orderly.
2 EM First Aid Men.

(3) One (1) ambulance will be available during firing.

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3-22-04
Reproduced at the National Archives

(4) All firing personnel have completed training as outlined in FM 6-75 (for 105mm Howitzer) or FM 6-81 (for 155mm Howitzer).

(5) Post Range Guards (See Annex #8) at least thirty (30) minutes prior to scheduled firing time. Numbered range guards will be posted during all firing. Lettered range guards will be posted when corresponding lettered firing positions are being used.

(6) Instruct range guards as to their duties, i.e., allow no one to enter the impact area or gun position area without permission of the Range Officer or the Commanding Officer of unit firing.

(7) Raise the Red Flag, See Annex #8 , when range is clear for firing.

(8) Notify the Commanding Officer of unit firing when range is clear for firing.

(9) Entry into firing positions for the following gun positions will be as listed below;

"A" - From the South along Telephone Road.
"B" - From either of the following:

(a) From the North on the trail from Old Camden Road at coordinates (1015.4-1217.5).

(b) From the South on the Washington Light Infantry Road.

"C" - From the South along Hartsville Guards Road.

b. During Use of Range;

(1) The Officer in Charge of Firing will be in constant communication with the Observation Post (CO of Unit firing) and as near as practicable to his Range Guards.

(2) The Officer in Charge of Firing will be responsible that all safety requirements and precautions outlined in par 38 a (1) are complied with.

c. After Use of Range; The Officer in Charge of Firing will be responsible that;

(1) Range Guards are relieved.

(2) All trash has been policed.

(3) A certificate has been executed on all HE ammunition expended.

SECTION X

PISTOL RANGE "E"

39. Description;

a. Location; (1027.4-1212.5).

b. Telephone Number; Tie Line 14.

c. Number of Firing Points; 60.

d. Type Weapon Fired; Automatic Pistol Cal..45, M1911 or M1911A1, Colt Revolver, Cal..45, M1917.

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3-22-04

f. Distances from Firing Points to Targets: 15 & 25 yards.

g. Safety Limits: See Annex #1.

h. Danger Area: See Annex #1.

i. Range Guard Positions: None.

j. Available Range Facilities:

Target House
Latrine
120 Pistol Rests

40. Responsibilities of Post Range Officer:

Same as outlined in par 35.

41. Responsibilities of Officer in Charge of Firing:

Same as outlined in par 36.

SECTION XI

MACHINE GUN RANGE #2

42. Description:

a. Location: (1009.1-1214.7).

b. Telephone Number: Tie Line 14, Ring 2.

c. Number of Firing Points: 60.

d. Type Weapon Fired: MG Cal..30, Light, M1919A4; MG Cal..30, Heavy, M1917A1.

e. Courses to be Fired: A or B (Modified to 500 inch Range).

f. Distance from Firing Point to Targets: 500 inches.

g. Safety Limits: (See Annex #1).

h. Danger Area: (See Annex #1).

i. Range Guard Positions: None.

j. Available Range Facilities:

(1) Control Tower.
(2) Covered Latrine.
(3) Dry Firing Line with 10 Targets.
(4) Mess Hall.
(5) Scoring and Critique Tables.
(6) Supply House.
(7) Target House.

k. Type Target: 500 inch Machine Gun.

43. Responsibilities of Post Range Officer: As outlined in par 13.

44. Responsibilities of Officer in Charge of Firing: As outlined in par 14.

RANGE REGULATIONS FORT JACKSON

1. These regulations will be treated as Memorandum Receipt property and will be turned in to Post Range Officer prior to the units departure from this Post. The Post Range Officer is designated as accountable officer for these regulations and is charged with distribution to units using the range facilities at this Post. Individual sections will not be removed from these regulations; the book will be maintained as bound.

2. In case of revision, each newly revised page will indicate, at the top, the page that it rescinds. Such changes will be posted and the old copies removed from the files.

3. All officers will familiarize themselves with all pertinent sections of these regulations prior to conducting range firing on any range.

4. Unit commanders are responsible that all range firing is conducted in compliance with the instructions set forth herein.

a. All personnel of the company are notified of the Fire Alert status of the company.

b. All personnel (less not more than 15%) are immediately available to the company area at all times during the Fire Alert tour.

c. Not less than one (1) officer and four (4) non-commissioned officers are available on thirty (30) minutes notice for supervision in case of fire.

8. Instructions in case of fire:

a. In the event of a fire on the Fort Jackson reservation the Fire Alert Company will be alerted by the Fire Marshal. At the time of alerting, the Fire Marshal will furnish information to the Fire Alert Company as to the transportation being furnished to the Company.

b. The First Sergeant, (or the Charge of Quarters if after duty hours) will notify, by the most expeditious means, the Alert Officer and Non-commissioned Officers of the Alert, and will then proceed to form the company in readiness to move to the fire.

c. The Alert Officer, upon arrival in the company area will assume command of the company, and will hold the company in readiness pending instructions from the Fire Marshal. Troops will be issued any fire fighting equipment available in the company area such as picks, shovels, etc. Personnel will again be cautioned on the dangers of handling duds.

d. Once alerted and until released from alert, by the Fire Marshal, the Fire Alert Company will be under direct control of the Post Fire Marshal. The Post Fire Marshal will be responsible for the movement, and employment of this company in combating the fire.

e. At all times during the actual fighting of the fire, the Alert Officer and Non-commissioned Officers will be in the immediate vicinity of the men fighting the fire, and will exercise close supervision to prevent touching of duds by personnel.

SECTION III

AMMUNITION, EXPLOSIVES AND DUDS

9. Members of any command quartered in company or detachment areas will not have ammunition, grenades, shells, fuses, or any other explosive, live or otherwise, of any type, in their possession or secreted on the reservation. Such items may be in the possession of military personnel only when required in the performance of military duty. Unit Commanders will make frequent searches to insure compliance with the preceding regulation and will cause a search to be made of all EM after any use of ammunition or explosives.

10. Any enlisted man at this station who discovers the unauthorized presence of explosives referred to above will immediately report such to the unit commander. No one will molest, touch, or in any manner handle such explosives whenever found except as follows:

DECLASSIFIED
Authority NND 947000
By CO NARA Date 3-22-04

a. When required in performance of military duty.

b. When small arms ammunition (caliber .22, .30, .45, and .50) is discovered, the finder will collect and carry same openly to unit commander for disposition.

11. No one will procure, secure or retain in their possession any explosive, dud of any type or any part thereof as a souvenir of for their own personal use, unless specifically authorized in writing by a commissioned officer to have such items.

12. Duds:

a. It is the responsibility of all unit commanders to orient their troops in the danger of handling duds. Specifically:

(1) Teach men the importance of leaving DUDS ALONE.

(2) "Policing the Area" does NOT mean picking up duds.

(3) HE impact areas are OFF LIMITS except as outlined in (4) and (5) below.

(4) The Officer-in-charge of firing will be responsible for appointing experienced non-commissioned officers from within his own unit to check the impact area for all duds upon completion of firing. The non-commissioned officers so appointed will be the sole persons from the firing unit authorized to enter the impact area from the time the firing unit has fired its first live round until it has been cleared by Range Headquarters.

(5) For Weapons Demonstration Range: The only authorized personnel to enter the impact area are demonstrators and non-commissioned officers appointed by Officer-in-charge of firing as in (4) above.

b. In the event a dud is found, the site will be marked and the Range Officer, Fort Jackson will be notified as follows:

(1) Location of Dud (coordinates if possible)

(2) Type of Dud

(3) Number of Duds

(4) Person making report (Name, rank and organization)

c. All ranges and impact areas will be "Off Limits" to all unauthorized personnel, ie., any personnel not firing on the range or not a member of the permanent Range Detachment.

DECLASSIFIED
Authority NND 997000
By CO NARA Date 3-22-04

b. On-the-spot Maintenance: The Post Range Officer will be responsible for continuous maintenance, during firing, of target frames, target devices and communication lines.

17. After Use of Range by Using Units:

a. Final Clearance: The Post Range Officer will be responsible for issuance of a written clearance of the range upon request by the using unit. Prior to the issuance of this clearance, he will determine by inspection that:

(1) The range proper is in an acceptable state of police.

(2) The condition of range facilities is the same as when accepted by the using unit.

(3) All expendable and non-expendable range supplies and equipment are turned in by the using unit.

(4) The using unit has extinguished all range fires and has disposed of any known duds.

b. Necessary Repair: The Post Range Officer will be responsible for making all necessary repairs. He will be responsible for making the necessary work order requests to the Post Engineer or Post Signal Officer for repairs of such a nature as to require their aid.

SECTION III

Responsibilities of Officer-in-Charge of Firing

18. Before Using Range:

a. The Officer-in-Charge of firing will be responsible for the operation of ranges in compliance with pertinent provisions of:

SR 385-310-1
Pertinent Technical Manuals and Field Manuals
Chapter III below

He will also be responsible for the dissemination of the information contained in the pertinent provisions of the above references for all supervisory personnel.

b. The Officer-in-charge of firing will be responsible for notifying the Post Range Officer if, for any reason, firing is cancelled.

c. Safety Precautions: The Officer-in-charge of firing will be responsible that all personnel on the range have received a course of instruction in the weapon(s) to be fired and that they are familiar with:

(1) The safety features of the weapon(s) to be fired.

(2) The danger areas and safety limits.

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3-22-04
Reproduced at the National Archives

(2) On the Firing Line:

(a) The organization of personnel on the firing line will be so arranged as to adapt the using unit to the course to be fired.

(b) The organization of personnel on the firing line will be so arranged as to make the most efficient use of the time allotted.

(c) An officer will be present on the firing line at all times.

(d) Safety precautions will be followed at all times, including the following:

1. Weapons will be pointed "down range".

2. Weapons will be cleared and placed in the "safe" firing position when not in operation.

3. "Cease firing" will be given at any time when a condition arises which in anyway precludes the continuation of safe firing.

4. Firing, limited to designated firing lines or areas and between designated limiting points, will be observed at all times.

5. No one will move from the firing line in the direction of the impact area until all weapons have been cleared and placed in the "safe" firing position and then not until order to do so has been given by the Officer-in-charge of the firing line.

6. No firing will be conducted when the scarlet streamer is not displayed on the range pole.

7. In case of an accident, such as the bursting of a barrel, or permanent damage to the weapon, the weapon will be left in the position in which the accident occurred and the Ordnance Officer, Fort Jackson, notified.

8. If any serious malfunction of Ordnance equipment occurs on the range, such equipment will be turned over promptly to the Ordnance Officer without effort to repair it.

(3) Pits (where applicable):

(a) Organization:

DECLASSIFIED
Authority NND 947000
By CO NARA Date 3-22-04

(5) Miscellaneous: All immediate repairs necessary will be reported to the Range Officer for action.

20. After Use of Range: The Officer-in-charge of firing will be responsible, upon completion of firing to:

a. Check for all range fires detected on the range, using the same procedure as in par 8 and 19 a (4) above, in the event one is discovered.

b. Check for, and report duds (where applicable) as follows:

(1) Appoint a limited number of responsible, experienced, non-commissioned officers to conduct a search for duds.

(2) Leave the suspected dud undisturbed.

(3) Mark the location by a dud marker (Note: Dud markers, 10" red discs with DUD marked in white letters, placed on 8 foot pole, are located in all target houses).

(4) Report the exact location by coordinates to the Post Range Officer. If Post Range Officer indicates that he will investigate immediately, leave someone nearby to guide him to the exact location.

c. Police the entire range site for trash and brass.

d. Conduct a search of all personnel for live ammunition.

e. Turn in all supplies, drawn specifically for range firing, to same agencies drawn from (See par 9 c, above).

f. Execute the following certificate (issued with all ammunition) for all HE ammunition expended:

C E R T I F I C A T E

(Battery_____, _____, Field Artillery Bn)

(Company_____, _____, Infantry)

_____
(Date)

I certify that the following information, concerning quantities of ammunition listed below, is true and correct to the best of my knowledge and belief:

TYPE	ISSUED	EXPENDED	TURNED IN	DUDS	LOCATION OF DUDS

_____
(Signature)

_____
(Name Typed)

_____
(Rank and Organization)

DECLASSIFIED
Authority NND 947020
By NARA Date 3-22-04

10. Sand bag walls at least 20 inches thick or equivalent protection are provided for coaches, officer-in-charge of throwing, assistant instructors, or nonparticipants in instruction.

11. Practice hand grenades are practically free from hazard when properly used but they require the same degree of care in handling and operation as the standard live grenades.

12. The practice grenade may be thrown a safe distance by the average thrower, but personnel should take cover for the purpose of training. The steel helmet should be worn. Although there is practically no danger involved, personnel should remain at a safe distance.

13. Practice grenades that fail to function (duds) will not be recovered until at least 10 minutes have elapsed, and should be handled by experienced personnel.

c. After Use of the Range:

(1) Execute certificate for all HE Ammunition expended (See par 20 f) for example of certificate.

(2) Police all trash, dummy grenades, and all component parts of practice grenades.

d. Dummy Grenade Court: Dummy grenade court will be used to familiarize men with the throwing positions.

e. Rear Area Training Area: Rear Area training area is to be used for instruction in nomenclature and characteristics of grenades only. No demonstrations in throwing practice or live grenades will be conducted in this rear training area.

SECTION II

PISTOL RANGE # 1 AND PISTOL RANGE "E"

24. Description:

a. Location:

Pistol Range # 1 - (1008.8 - 1214.9)
Pistol Range "E" - (1027.4 - 1212.5)

b. Telephone Number:

Pistol Range # 1 - Tie Line 14, Ring 3
Pistol Range "E" - None

c. Number of Firing Points:

Pistol Range # 1 - 20. See Annex # 7
Pistol Range "E" - 60. See Annex # 8

DECLASSIFIED
Authority NND 997000
By CO NARA Date 3.22.04

d. Type Weapon Fired: Automatic pistol, Cal. .45 M1911 or M1911A1
Colt Revolver, Cal. .45 M1917

e. Courses to be Fired: As prescribed in pars 87-90, FM 23-25

f. Distance from firing line to targets:

Pistol Range # 1 - 15, 25 & 50 yards
Pistol Range "E" - 15 & 25 yards

g. Safety Limits: See Annex # 1

h. Danger Area: See Annex # 1

i. Range guard positions: None

j. Available Range facilities:

Pistol Range # 1 - Target House
Latrine (to be used in conjunction with latrine on MG Range # 2).
Pistol Rests

Pistol Range "E" - Target House
Latrine
120 Pistol Rests

25. Responsibilities of Post Range Officer:

a. Continuous responsibilities: The Post Range Officer is responsible for the maintenance of all range facilities mentioned in 24j above.

b. Before use of range by using unit: The Post Range Officer is responsible for supplying using units with sufficient number of E&L type targets.

26. Responsibilities of Officer-in-charge of firing:

a. Before use of range: The Officer-in-charge of firing will be responsible that:

(1) Both he and his supervisory personnel are thoroughly familiar with pars 13, 24, 25, 91, 96 FM 23-35, SR 385-310-1, and par 1-20 of these range regulations.

(2) All firers have completed as a minimum requirement all mechanical training and marksmanship training listed in FM 23-35.

(3) All pistols have had safety devices tested per par 25 FM 23-35.

(4) All revolvers have had safety devices tested per par 64 FM 23-35.

b. During use of range:

(1) Behind the firing line (opposite side of firing line from impact areas).

DECLASSIFIED
Authority NND 947000
By CO NARA Date 3.22.04

(a) Only weapons that have been unloaded, locked and cleared by the officer-in-charge of firing, will be permitted to be removed from the firing line.

(b) All weapons will be carried at the "Raise Pistol" position.

(2) On the firing line:

(a) Procedure for firing: As outlined par 94 e, FM 23-35.

(b) Organization: As outlined in par 94 a and d, FM 23-35.

(c) Safety. For pistol and revolver.

1. Execute unload every time the pistol or revolver is picked up for any purpose. Consider every revolver as loaded until proven otherwise.

2. Always unload the pistol or revolver if it is to be left where someone else may handle it.

3. Always point the pistol or revolver up when snapping it after examination. Keep the hammer fully down when the weapon is not loaded.

4. Never place the finger within the trigger guard until it is intended to fire or to snap for practice.

5. Never turn around at the firing point while you hold a pistol or revolver in your hand.

6. Never point the revolver or pistol at anyone. On the range do not snap for practice while standing back of the firing line.

For Pistol Cal. .45 M1911 or M1911A1 only

7. When units carrying the pistol are first formed, the officer or non-commissioned officer-in-charge causes the men to execute "Inspection Pistol".

8. The safe firing position referred to in par 19 a (2) (d) "Safety precautions" will be considered to have been attained when the weapon is unloaded, the magazine has been removed and the slide has been locked in the rear position by the [illegible] slide stop.

DECLASSIFIED
Authority NND 947020
By NARA Date 3.22.04

9. Before loading the pistol, draw back the slide and look through the bore to see that it is free from obstruction.

10. On the range do not insert a loaded magazine until the time for firing.

11. On the range do not load the pistol with a cartridge in the chamber until immediate use is anticipated. If there is any delay, lock the pistol and unlock it only while extending the arm to fire. Do not lower the hammer on a loaded cartridge; the pistol is much safer cocked and locked.

12. In reducing a jam, first remove the magazine.

13. To remove a cartridge not fired, first remove the magazine and then extract the cartridge from the chamber by drawing back the slide.

For Revolver Cal. .45

14. The safe firing position referred to in par 19 a (2) (d) 2 "Safety precautions" will be considered to have been attained when the weapon is unloaded, the cylinder is opened and the safety has been placed in a safe position.

15. Before loading, open the cylinder and look through the bore to see that it is free from obstruction.

16. On the range do not cock the revolver until immediate use is anticipated. If there is any delay, lower the hammer and recock it only when ready to fire.

17. If the revolver fails to fire, open the cylinder and unload if the hammer is down. If the hammer is cocked or partly cocked, a breakage has occurred. In this case hold the revolver at "Raise Pistol" and announce the fact to the officer-in-charge.

18. To remove a cartridge not fired, open the cylinder and eject, first lowering the hammer if cocked.

(d) After Use of Range: The Officer-in-charge of firing will be responsible that all trash has been policed and burned and that all brass has been collected and disposed of in accordance with par 108, AR 775-10.

DECLASSIFIED
Authority NND 947000
By CO NARA Date 3-22-04

SECTION III

DISMOUNTED SUB-MACHINE GUN RANGE # 1

27. Description:

a. Location: (1017.4 - 1212.2) See Annex # 1.

b. Telephone Numbers: Tie Line 10 Ring 2.

c. Number of Firing Points: 3 (See Annex # 19).

d. Type Weapon Fired: Sub-Machine Gun M3A1 Cal. .45, Thompson Sub-Machine Gun Cal. .45 M1928A1

e. Course to be fired on range: See par 53-57 FM 23-40 and FM 23-41.

f. Safety Limits: See Annex # 1.

g. Danger Area: See Annex # 1.

h. Range Guard Positions:

(1) Position: Guard at junction of Timmonsville Guard Road and Range Road. Coordinates (1018.2 - 1211.4).

Instructions: Allow no travel to proceed North on Timmonsville Guard Road into impact area.

(2) Position: Guard at Weston Pond Road and Hwy # 262. Coordinates (1015.7 - 1210.4).

Instructions: To allow no traffic to proceed North on Weston Pond Road from Hwy # 262.

(3) Position: Guard at junction of Washington Light Infantry Road and Hwy # 262. Coordinates (1015.3 - 1210.4).

Instructions: To allow no traffic to proceed North on Washington Light Infantry Road from Hwy # 262.

i. Available Range Facilities:

(1) Covered Latrine

(2) 3 Target Houses

(3) Target frames, target assemblies and levers.

j. Type Target: E, F and Trapezoid.

28. Responsibilities of Post Range Officer:

a. Continuous responsibilities: The Post Range Officer is responsible for the maintenance of all range facilities mentioned in par 27 i, above.

DECLASSIFIED
Authority NND 947000
By CO NARA Date 3-22-04

b. Before Use of Range by Using Unit: The Post Range Officer is responsible for supplying using units with targets listed in paragraph 27 j above, target frames and paste.

29. Responsibilities of Officer-in-charge of firing:

a. Before Use of Range: The Officer-in-charge of firing will be responsible that:

(1) Both he and his supervisory personnel are thoroughly familiar with par 53-57, FM 23-40, FM 23-41, SR 385-310-1 and par 1-20 of these range regulations.

(2) All firers have completed, as a minimum requirement, all mechanical training, gun drill and marksmanship required by FM 23-40 and FM 23-41.

(3) Prior to Firing:

(a) An officer will check each gun and make sure that each weapon is functioning properly.

(b) A cleaning rod and dry patch is run through the bore of each gun.

b. During Use of the Range:

(1) Operation of the Range:

(a) Behind the firing line (Opposite side of firing line from impact area): The Officer-in-charge of firing will be responsible that before removing a sub-machine gun from the firing points, or from the firing line, each gun will be inspected, by an officer to see that it is unloaded. As part of this inspection, a cleaning rod will be passed through the bore of each gun.

(b) On the Firing line:

1. Safety Precautions: The Officer-in-charge of firing will be responsible for the accomplishment of the following safety precautions: Note: The "Safe firing position" referred to in par 19 (2) (d) 2 "Safety Precautions" will be considered to have been attained for the sub-machine gun when:

a. The bolt has been opened.

b. A cleaning rod has been passed through the barrel.

(c) All decisions as to actions to be taken on stoppages will be made by an officer.

c. After Use of Range: The Officer-in-charge of firing will be responsible that all trash accumulated in the trash bin is burned in the metal receptacles provided for that purpose, that proper disposition has been made of all brass and that the targets have been prepared for use by the next unit.

DECLASSIFIED

Range # 2 - (1009.1 - 1214.7).

b. Telephone Number:

Range # 1 - Tie Line 14, Ring 1.
Range # 2 - Tie Line 14, Ring 2.

c. Number of Firing Points:

Range # 1 - 60. See Annex # 5.
Range # 2 - 60. See Annex # 6.

d. Type Weapon Fired: Machine Gun Cal. .30, Light (M1919A4)
Machine Gun Cal. .30, Heavy (1917A1)

e. Course to be Fired: A or B.

f. Distance from gun position to target: 500 and 1000 inches.

g. Safety Limits: See Annex # 1.

h. Danger Area: See Annex # 1.

i. Range Guard Positions: None necessary.

j. Available Range Facilities:

(1) Control Tower
(2) Covered Latrine
(3) Dry Firing Line with 60 Targets
(4) Mess Hall
(5) Scoring and Critique Tables
(6) Supply House
(7) Target House

k. Type Target: 500 or 1000 inch Machine Gun.

31. Responsibilities of Post Range Officer:

a. Continuous Responsibilities: The Post Range Officer is responsible for the maintenance of all range facilities mentioned in par 30 j, above.

b. Before Use of Range by Using Unit: The Post Range Officer is responsible for supplying using units with 500 and 1000 inch Machine Gun targets and target frames.

32. Responsibilities of Officer-in-charge of firing:

a. Before Use of Range: The Officer-in-charge of firing will be responsible that:

DECLASSIFIED
Authority NND 947000
By NARA Date 3-22-01

(1) Both he and his supervisory personnel are thoroughly familiar with pars 110-122, FM 23-55, SR 385-310-1 and par 1-20 of these range regulations.

(2) All firers have completed, as a minimum requirement, all mechanical training, gun drill and marksmanship required by FM 23-55.

(3) Prior to Firing:

(a) An officer will check headspace of each gun and make the proper adjustment.

(b) A cleaning rod and dry patch is run through the bore of each gun.

b. During Use of the Range:

(1) Operation of the Range:

(a) Behind the firing line (Opposite side of firing line from impact area): The Officer-in-charge of firing will be responsible that before removing a machine gun from its firing position, or from the firing line, each gun will be inspected, by an officer to see that it is unloaded. As part of this inspection, a cleaning rod will be passed through the bore of each gun.

(b) On the Firing Line:

1. The most efficient organization, for this range consists of a breakdown into 5 equal sized orders as outline below.

1 Order Gunner	Wet Line
1 Order Asst Gunner	Wet Line
1 Order Observer	Wet Line
1 Order Gunner	Dry Line
1 Order Asst Gunner	Dry Line

2. Safety Precautions: The Officer-in-charge of firing will be responsible for the accomplishment of the following safety precautions: Note: The "Safe firing position" referred to in par 19 a (2) (d) 2 "Safety Precautions" will be considered to have been attained for the machine gun when:

a. A cleaning rod has been passed through the bore.

b. A clearing block has been placed in the receiver of the gun.

(c) A clearing block should be inserted in the receiver of each gun during the time it is not being used to fire.

(d) All decisions as to actions to be taken on stoppages will be made by an officer.

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3-22-04

c. After Use of Range: The Officer-in-charge of firing will be responsible that all trash accumulated in the trash bin is burned in the metal receptacles provided for that purpose and that all brass has been collected and disposed of in accordance with par 108, AR 775-10.

SECTION V

.50 CAL. MACHINE GUN 1000" RANGE

33. Description:

a. Location: Center of Firing Line (1029.7 - 1216.3)

b. Telephone Number: TL 18 R 3

c. Number of Firing Points: 12

d. Type of Weapon: .50 Cal. Machine Gun, ground or vehicle mount

e. Safety Limits: See Annex # 1

f. Danger Areas: See Annex # 1

g. Range Guard Position:

(1) Position: Guard at junction of Pilgrim Church Road and Range Road. Coordinates (1029.7 - 1216.4)

(2) Instructions: To allow no traffic to proceed West on Pilgrim Church Road from Range Road

h. Available Range Facilities:

Target frames

34. Responsibilities of Post Range Officer:

a. Continuous Responsibilities: The Post Range Officer is responsible for the maintenance of all range facilities mentioned in par 33 h, above.

b. Before use of Range by Using Unit: The Post Range Officer is responsible for supplying using units with targets, target frames, and paste.

35. Responsibilities of Officer-in-charge of firing:

a. Before Use of Range: The Officer-in-charge of firing will be responsible that:

(1) Both he and his supervisory personnel are thoroughly familiar with safety regulations for weapon being fired, SR 385-310-1 and par 1-20 of these range regulations.

(2) All firers have completed, as a minimum requirement, all mechanical training, gun drill and marksmanship, required by FM 23-65.

DECLASSIFIED
Authority NND 947020 By CO NARA Date 3-22-04

(2) On the firing line:

(a) Procedure for firing:

Rifle - as outlined in FM 23-5.
Carbine - as outlined in FM 23-7.
BAR - as outlined in FM 23-15.

(b) Organization of the firing line:

Rifle - as outlined in FM 23-5.
Carbine - as outlined in FM 23-7.
BAR - as outlined in FM 23-15.

(c) Safety:

1. The "Safe Firing Position" referred to in par 19 a (2) (d) 2 "Safety Precautions" will be considered to have been attained when:

Weapon is locked.
Ammunition is completely removed from the weapon.
Bolt is open.
A cleaning rod has been run through the bore of the weapon.

2. Weapons will be checked daily by an officer prior to firing to determine that chambers and bores are free from obstruction.

(d) Communication: Control of the pits will be maintained by telephone communication from the firing line.

All request for marking and disking targets will be transmitted via telephone.

(3) Pits:

(a) Personnel in the pit details will stay on the concrete walk between the target frames and the revetment at all times when firing is in progress.

c. After Use of the Range:

(1) Brass will be policed daily after the use of the range.

(2) All trash accumulated will be policed daily.

SECTION VII

RIFLE TRANSITION RANGE # 1

39. Description:

a. Location (1008.7 - 1212.3)

DECLASSIFIED
Authority NND 947000
By NARA Date 3-22-04

b. Telephone Number - Tie Line 11.

c. Number of firing lanes: 15.

6 lanes (1 through 6) - Table VI.
4 lanes (7 through 10) - Table VII.
1 lane (11) - Table VIII.
4 lanes (12 through 15) - Table IX.

d. Course to be fired:

Table VI and VII - Par 69d FM 23-5
Table VIII - Par 69d FM 23-5, C2
Table IX - as follows:

PHASE LINES	TARGETS SINGLE	DOUBLE	TRIPLE	RANGE YARDS	SHOTS	TARGET	POSITION	SLING
2 - 3	2	1	0	5-70	4	E	Off Hand	None
3 - 4	0	1	2	5-70	8	E	Hip	None
4 - Final	2	3	0	5-70	8	E	Off Hand	None

(1) A single silhouette represents an enemy rifleman. A double silhouette represents an enemy automatic rifle team.
A triple silhouette represents a machine gun.

(2) Targets will be exposed in sequence upon signal from the coach. Time of exposure of targets is as follows: (a) Single silhouettes, 3 seconds. (b) Double silhouettes, 4 seconds. (c) Triple silhouettes, 5 seconds.

(3) Phase lines are placed after the 4th, 12th and 20th targets to assist in the enforcement of safety precautions.

e. Scoring and satisfactory scores:

TABLE	SCORING PROCEDURE	SATISFACTORY SCORES
Table VI & VII	Par 69e, (1) & (2), FM 23-5	VI not applicable VII - 8
Table VIII	Par 69e (3), FM 23-5 C2	1 - 4
Table IX	For each target hit - 1 Pt	8

f. Type of weapon fired: Rifle Cal. .30, M1.

g. Distance from firing position to target:

Table VI - 200, 300, and 500 yards.
Table VII - 250, 300, 350, 400, 450 and 500 yards.
Table VIII - 100 yards.

DECLASSIFIED
Authority NND 947000
By CO NARA Date 3-22-04

h. Safety Limits: See Annex # 1

i. Danger Areas: See Annex # 1

j. Range Guard Positions:

(1) # 1 - Junction Ancrum Ferry Road and Hartsville Guard Road (1009.1 - 1213.4)

(a) Instructions:

1. Allow no one to enter Hartsville Guard Road.

2. Instruct all personnel travelling on Ancrum Ferry Road not to turn South between Range Road and Telephone Road.

(2) # 2 - Junction Ancrum Ferry Road and Telephone Road (1013.1 - 1214.3)

(a) Instructions:

1. Instruct personnel travelling on Telephone Road not to turn West between Ancrum Ferry Road and Hwy 262.

2. Instruct all personnel travelling on Ancrum Ferry Road not to turn South between Range Road and Telephone Road.

(3) # 3 - Junction Telephone Road and Hwy 262 (1013.3 - 1210.1)

(a) Instructions:

1. Instruct personnel travelling on Telephone Road not to turn West between Hwy 262 and Ancrum Ferry Road.

(4) # 4 - Junction Catawba Rifles and Range Road (1008.6 - 1211.7)

(a) Instructions:

1. Instruct personnel travelling on Range Road not to turn East between Catawba Rifles Road and Ancrum Ferry Road.

2. Allow no one to enter Catawba Rifles Road.

(5) # 5 - Junction Ancrum Ferry Road and Range Road (1008.3 - 1213.2)

(a) Instructions:

1. Instruct personnel travelling on Range Road not to turn East between Ancrum Ferry and Semmes Roads.

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3-22-04

(6) # 6 - Junction Semmes Road and Range Road (1008.6 - 1211.2)

(a) Instructions:

1. Instruct personnel travelling on Semmes Road not to turn North between Range Road and Telephone Road.

2. Instruct personnel travelling on Range Road not to turn East between Semmes Road and Anerum Ferry Road.

(7) # 7 - Junction Semmes Road and Hartsville Guard Road (1011.2 - 1209.3)

(a) Instructions:

1. Instruct personnel travelling on Semmes Road and Hwy 262 not to turn North between Range Road and Telephone Road, except that personnel may travel on Hartsville Guard Road not further than 1500 yards North of Hwy 262.

k. Available range facilities:

(1) 7 Control Towers
(2) 1 Latrine
(3) 1 Set of Bleachers
(4) 2 Target Houses
(5) Work Tables
(6) Mess Area
(7) Communication Arrangement (See Annex # 21).
(8) Table Model of Range

40. Responsibilities of Post Range Officer:

a. Continuous Responsibilities: The Post Range Officer is responsible for the maintenance of all range facilities mentioned in k (above).

b. Before Use of Range by Using Unit: The Post Range Officer is responsible for supplying using units with a sufficient number of type "E" Silhouettes, including those colored Red for 500 yard firing, and a sufficient number of target staves for the entire period of firing.

41. Responsibilities of Post Signal Officer:

a. Before Use of Range by Using Unit: The Post Range Officer will be responsible for instructing the Unit Range Officer in the use of permanent type telephone system. On request from the Post Range Officer, the Post Signal Officer will make the necessary repairs to these facilities.

42. Responsibilities of Officer-in-Charge of Firing:

a. Before Use of Range: The Officer-in-Charge of firing will be responsible that:

DECLASSIFIED
Authority NND 947030
By CO NARA Date 3-22-04

(1) Both he and supervisory personnel are thoroughly familiar with pars 34, 69d, e, f, g, 189-191b FM 23-5, C1 and 2, and SR 385-310-1 and Annex # 24 as well as par 1-20 of these range regulations.

(2) All firers have fired the rifle qualification Course "B" and have received instruction in range estimation, assuming firing position and assault fire required by Annex 24.

(3) One day prior to firing the Unit Range Officer makes a check of the range facilities, supplies and communications to insure that the range is in proper condition for firing. Any deficiencies will be reported to the Post Range Officer promptly so that repairs can be made prior to firing.

(4) Range Guards are posted in psoitions listed in 39 j above.

(5) When pits are filled with water, they are bailed out prior to firing and that every third pit has a bucket available for any subsequent seepage into the pits.

(6) The pit details are familiarized with their duties and have at least one "dry run" prior to actual firing.

b. During Use of Range: The Officer-in-charge of firing will be responsible for the overall operation of the range to include:

(1) Behind the firing Line (Opposite side of firing line from impact area).

(a) Only weapons that have been unloaded, locked, and cleared by an officer will be permitted to be removed from any firing point or firing line.

(b) Movement in rear of firing points by personnel undergoing this course will be at a walk with rifles held at "Port Arms".

(c) Any minor repairs on table model targets and table 9 will be done by using unit.

(2) On the Firing Line:

(a) Procedure for firing: As outlined in Annex 24.

(b) Organization of firing line: As outlined in Annex 24.

(c) Safety:

1. The safe firing position referred to in par 19 a (2) (d) 2, "Safety precautions" will be considered to have been attained when:

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3-22-04

a. Rifle is locked.

b. Ammunition completely removed from rifle.

c. Bolt is open.

d. A cleaning rod has been run through the bore of the rifle.

2. Safety Precautions: For Table IX.
The firer will be instructed prior to firing that targets are not more than 3 feet in size, targets will be on same level as ground, targets to front, right or left front only.
The Coach Cadreman will;
Stay immediately in rear of firer.
Regulate speed of movement of firer.
Keep target operation well in rear of firer.
Determine that firer's weapon is unloaded and bolt is open before moving back to starting point.

(d) Communication: The firing point on each firing lane will maintain contact with the pits in its own lane by the use of field telephones.

(3) Pits:

(a) Organization: Pit details subsequent to the first order will be thoroughly instructed in their duties and in safety precautions to be observed while operating the pits.

(b) Communication: Each lane within each of the 4 tables will have its own integral communication met by which control will be exercised. as follows;

TABLE VI: The centerpit at each of the three ranges (200,300,500 yds) will have a terminal for telephone communication to the firing point.
Communication between any of the three pits located at one of the three ranges may be established by use of whistles signals.
Suggested signals are as follows:
"Attention" 4 short blasts
"Targets Up" 1 long blast
"Targets Down" 2 long blasts
"All Clear" 2 short blasts

TABLE VII: Each pit at each of the six different ranges (200,250, 300, 350, 400 & 450 yds) will have a terminal for telephone communications to the firing point.

TABLE VIII: The pit will have a terminal for telephone communication to the firing point.

DECLASSIFIED
Authority NND 947000
By CO NARA Date 3-22-04

(c) Red silhouette targets used at 500 yds will be scored and pasted on the backside so as to not deface the red front.

(d) Scoring: Scoring will be accomplished by pit detail as follows.

TABLE VI: Flutter and lower target when hit, then score.
TABLE VII: Same as above.
TABLE VIII: Score after command "Targets Down" is given.
TABLE IX: Not applicable (see par 39 d & e, for scoring).

(e) Safety: See par 19 (2) (d) 2 "Safety".

c. After Use of Range: The Officer-in-Charge of firing will be responsible:

(1) That all trash accumulated in trash bins is burned.

(2) That new targets are fastened on all staves and then stored in target house for the use of the next unit.

SECTION VIII

RIFLE AND CARBINE TRANSITION RANGE # 1 AND # 2

43. Description:

a. Location:

(1) Range # 1 (1029.8 - 1216.6)
(2) Range # 2 (1028.2 - 1218.8)

b. Telephone Numbers:

(1) Range # 1 - TI 21 R1
(2) Range # 2 - TI 21 R2

c. Number of firing lanes:

(1) Range # 1: 10

6 lanes (1 thru 6) Table 6 - M-1
Table 4 - Carbine
4 lanes (7 thru 10) Table 7 - M-1
Table 5 - Carbine

(2) Range # 2: 6

4 lanes (1 thru 4) Table 6 - M-1
Table 4 - Carbine
2 lanes (5 thru 6) Table 7 - M-1
Table 4 - Carbine

DECLASSIFIED
Authority NND 947000
By CO NARA Date 3-22-04

(5) Red flag is taken down upon completion of firing.

(6) All trash around gun position is policed upon completion of firing.

SECTION XIII

4.2 MORTAR RANGE # 1 AND # 2

57. Description:

a. Location:

(1) Range # 1 - Firing line coordinates (1009.4 - 1214.1) to (1009.3 - 1214.3)

(2) Range # 2 - Firing line coordinates (1022.45 - 1218.45) to (1022.20 - 1218.75)

(3) Impact Area - (See Annex # 1)

b. Telephone Number:

(1) Range # 1 - Tie line 14, Ring 4

(2) Range # 2 - None

c. Type of Weapon: 4.2" Chemical Mortar. (See FM 23-92 and TC 3 DA 28 Feb 50)

d. Maximum Range:

(1) Range # 1 - No weapon will be fired at a range greater than 1800 yards.

(2) Range # 2 - No weapon will be fired at a range greater than 2000 yards.

e. Targets: Natural terrain features. Drums and 6' x 6' target frames may be put out.

f. Observation Position:

(1) 4.2" Mortar Range # 1 - Control tower above firine line.

(2) 4.2" Mortar Range # 2 - Bunker # 17, coordinates (1022.4 - 1218.9).

g. Available facilities for 4.2" Mortar Range # 1:

Control tower
Stands capable of seating approx 1200
Latrine
Two target houses

h. Safety Limits: (See Annex # 1)

i. Danger Areas: (See Annex # 1)

j. Range Guard Positions:

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3-22-01

(1) 4.2" Mortar Range # 1: -

(a) # 1 - Junction Ancrum Ferry Road and Range Road (1009.1 - 1213.3).

1. Instructions:

a. Instruct personnel travelling on Ancrum Ferry Road not to turn North between Range Road and Telephone Road.

b. Instruct personnel travelling on Range Road not to turn East between Ancrum Ferry and Camden Roads.

(b) # 2 - Junction Ancrum Ferry and Telephone Roads (1013.1 - 1214.3).

1. Instructions:

a. Instruct personnel travelling on Ancrum Ferry Road not to turn North between Telephone Road and Range Road.

b. Instruct personnel travelling on Telephone Road not to turn West between Ancrum Ferry and Old Camden Roads.

(c) # 3 - Junction Old Camden Road and Telephone Road (1014.5 - 1217.5).

1. Instructions:

a. Instruct personnel travelling on Telephone Road not to turn West between Old Camden Road and Ancrum Ferry Road.

b. Instruct personnel travelling on Old Camden Road not to turn South between Telephone Road and Range Road.

(d) # 4 - Junction Old Camden Road and Range Road (1007.6 - 1215.1).

1. Instructions:

a. Instruct personnel travelling on Old Camden Road not to turn South between Range Road and Telephone Road.

b. Instruct personnel travelling on Range Road not to turn East between Old Camden Road and Ancrum Ferry Road except that personnel firing on ranges may enter those Ranges.

(2) 4.2" Mortar Range # 2: Five Range Guards will be posted at points indicated in Annex # 1 at 30 minutes prior to scheduled firing time.

(a) # 1 Guard will prevent any travel from going Northeast on Division Road.

DECLASSIFIED
Authority NND 947030
By NARA Date 3.22.04

(b) # 2 Guard will prevent travel from going South on Colonel Creek Road into the impact area.

(c) # 3 Guard will prevent any travel from going on Messers Pond Road from turning South on the road into the impact area.

(d) # 4 Guard will prevent any traffic from going West on Division Road into the impact area.

(e) # 5 Guard will prevent any traffic on Chavers PondRoad from going West into the impact area.

The officer-in-charge of firing will make sure the temporary road block is in position at junction of highway # 262 and Colonel Creek Road, coordinates (1025.9 - 1211.8). The officer-in-charge of firing will be responsible that any additional range guards necessary to insure that safety measures are observed are posted on approaches into the danger area.

k. Safety: The provisions of SR 385-310-1 and FM 23-92 will govern all firing. In case of conflict, SR 385-310-1 will govern all firing.

58. Responsibilities of Officer-in-Charge of Firing:

a. In addition to his responsibility for the posting of necessary range guards, the officer-in-charge of firing will be responsible that:

(1) Range guards are instructed as to their duties, i.e., allow no one to enter the impact area or gun position area without permission of the range officer or the commanding officer of the unit firing.

(2) Both he and his supervisory personnel are thoroughly familiar with the provisions of SR 385-310-1, and par 1-20 of the Fort Jackson Range Regulations.

(3) Red flag is predominantly displayed in the vicinity of the gun positions when range is cleared for firing.

(4) The Commanding Officer of the unit firing is notified when range is cleared for firing.

(5) Range guards are relieved and red flag is taken down upon completion of firing.

(6) All trash around gun position is policed upon completion of firing.

b. The officer-in-charge of firing will be responsible for the control of fires and the protection of personnel against duds on the Mortar Range in accordance with par 8 Sec II and Sec III of Chapter I of these regulations.

(1) The officer-in-charge of firing will warn all personnel of the danger of "duds" in the area.

DECLASSIFIED
Authority NND 947030
By CO NARA Date 3-22-04

(a) Duds discovered on the range will be plainly marked so they can be seen for a distance of 100 yards. These duds will not be moved or tampered with except by authorized personnel.

(b) The location of any duds will be reported to the Post Range Officer. Reports will show type, location and map coordinates and the name, rank, organization and telphone number of any person familiar with dud locations.

(2) The control of fires resulting from firing on the Mortar Range is the responsibility of the officer-in-charge of firing.

(a) When a fire on the Mortar Range is observed, the officer-in-charge of firing will immediately stop the firing and extinguish the fire.

(b) If the fire is located inside a danger area other than that of the Mortar Range, the officer-in-charge of firing will contact the Post Range Officer and report its location. The Post Range Officer will stop all firing in that area until the fire is extinguished.

(c) If a fire gets out of control of the using unit, the Post Range Officer and Post Engineer will be notified of that fact immediately.

(d) The officer-in-charge of firing will inspect the target area at the conclusion of each day's firing and extinguish all fires.

SECTION XIV

ROCKET LAUNCHER RANGE

59. Description:

a. Location: (1007.7 - 1216.4).

b. Telephone Number: Tie Line 15, Ring 3.

c. Number of Firing Points: 24

12 Practice Ammunition
12 Service Ammunition

d. Type of Weapon Fired: Rocket Launcher, 2.36 inch M9 and M9A1.

e. Distance from Gun Position to Target: 100 Yards.

f. Safety Limits: See Annex # 1.

g. Danger Area: See Annex # 1.

h. Rocket Launcher Range Guard Positions:

(1) # 1 - Boyden Arbor Road at (1007.0 - 1216.2)

DECLASSIFIED
Authority NND 947000
By CO NARA Date 3-22-04

(2) Danger Area: See Annex 11

(3) Safety Limits: See Annex 11

f. Range Guards: Range guards will be posted at points indicated in Annex 11 at least 30 minutes prior to scheduled firing time. The Officer-in-charge of firing will be responsible that any additional range guards necessary to insure that safety measures are observed are posted on approaches into the danger area. If the Artillery Range is in use at the same time that the Tank Range is being used, guard positions # 1, 2 and 3 of the Tank Range are not necessary. Temporary road blocks will be picked up at the KD Range Detachment and placed into position as indicated on Annex 11.

g. Safety: The provisions of SR 385-310-1 and the provisions of the appropriate Field Manuals will govern all firing. In case of conflict, SR 385-310-1 will govern.

69. Responsibilities of the Officer-in-Charge of Firing:

a. In addition to his responsibility for the posting of necessary range guards, the Officer-in-charge of firing will be responsible that:

(1) Range guards are instructed as to their duties, i. e., allow no one to enter the impact area or gun position area without permission of the range officer or the commanding officer of the unit firing.

(2) Both he and his supervisory personnel are thoroughly familiar with the provisions of SR 385-310-1 and par 1-20 of the Fort Jackson Range Regulations.

(3) Red flag is predominantly displayed in the vicinity of the gun positions and Weir Tower when range is cleared for firing.

(4) The Commanding Officer of the unit firing is notified when range is cleared for firing.

(5) Temporary road blocks have been placed in position and that same are returned to the KD Range Detachment upon completion of firing.

(6) Range guards are relieved and red flag is taken down upon completion of firing.

(7) All trash around gun position is policed upon completion of firing.

SECTION XVIII

ARTILLERY RANGE

70. Description:

a. Location: Gun Position Area - See Annex 12
Impact Area - See Annex 12

DECLASSIFIED
Authority NND 997030
By CO NARA Date 3-22-07

b. Telephone Number: (Weir Tower) Tie Line 10

c. Type Weapon Fired: 105mm and 155mm Howitzer and Rifles

d. Safety Limits: See Annex 12

e. Danger Area: See Annex 12

f. Range Guard Positions: See Annex 12

For Impact Area: All road guards on the numbered road guard positions will prevent entry into the impact area.

For Telephone Road: Two guards will be posted in addition to impact area road guards. RG-#2 (1013.0 - 1210.0) will allow only authorized traffic to proceed North along Telephone Road. RG-#11 (1011.2 - 1209.5) will allow only authorized traffic to proceed North along Telephone Road.

71. Responsibilities of Officer-in-charge of Firing:

a. Before Use of the Range: The Officer-in-charge of firing will be responsible that:

(1) Both he and his supervisory personnel are thoroughly familiar with Section 1, Appendix 1 FM 6-40 and FM 6-140, FM 6-75 (105mm Howitzer); FM 6-81 (155mm Howitzer); FM 6-90 plus C1 (155mm Gun); SR 385-310-1 and par 1-20 of these regulations.

(2) The following minimum number of personnel are designated:

1 Officer - Commanding Officer of Unit Firing.
1 Safety Officer at each Battery Position
EM Range Guards as needed (See par 68f above).
1 EM Telephone Orderly.
2 EM First Aid Men.

(3) One (1) ambulance will be available during firing.
(4) All firing personnel have completed training as outlined in FM 6-75 (for 105mm Howitzer) or FM 6-81 (for 155mm Howitzer) and FM 6-90 (for 155mm Gun).

(5) Three days prior to day of firing an overlay of the firing plan to include gun positions, proposed targets and type and number of weapons to be used will be sent to the Post Range Officer.

(6) Range Guards have been posted (See Annex 12).

(a) At least thirty (30) minutes prior to scheduled firing time. Numbered range guards will remain posted during all firing.

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3-22-04

(b) Instruct range guards as to their duties, i. e., allow no one to enter the impact area or gun position area without permission of the Range Officer or the Commanding Officer of unit firing.

(7) Temporary road blocks have been received from the KD Range Detachment Area and have been placed in position prior to firing as indicated on Annex 12.

(8) Raise the red flag on Weir Tower. (See Annex 12), when range is clear for firing.

(9) Notify the Commanding Officer of unit firing when range is clear for firing.

(10) Entry into firing positions area will be as listed below:

(a) From Hwy 262 North on Telephone Road.

(b) From Old Camden Road South on Telephone Road.

(c) East to West on Ancrum Ferry Road.

(11) Before moving personnel into impact area for setting up targets or before moving personnel up to observation posts, clearance will be made with Post Range Officer in order that firing on Tank Range can be halted until impact area of this range has been cleared of personnel.

b. During Use of Range:

(1) The Officer-in-charge of firing will be in constant communication with the Observation Post (CO of unit firing) and as near as practicable to his Range Guards.

(2) The Officer-in-charge of firing will be responsible that all safety requirements and precautions outlined in par 38 a (1) are complied with.

c. After Use of Range: The Officer-in-charge of firing will be responsible that:

(1) Range Guards are relieved and that temporary blocks have been returned.

(2) All trash has been policed.

(3) A certificate has been executed on all HE ammunition expended.

SECTION XIX

AIR-TO-GROUND RANGE REGULATIONS

72. The purpose of these regulations is to govern the use of the Air-to-Ground Range and to prescribe safety precautions to be observed in its use.

INSTRUCTIONS ON THE PROCEDURE

IN THE USE OF

RIFLE TRANSITION RANGE # 1 (12 Hrs)

1. OBJECTIVE:

a. To give the individual soldier practice in searching for targets, in estimating ranges, in setting his sights rapidly, and in firing an accurate shot quickly.

b. To emphasize the necessity for the continued application of the principles of rifle marksmanship in firing at field targets.

c. To give the individual soldier practice in assault firing.

2. TEXT REFERENCES:

FM 23-5, C1, 2 & 3
FM 23-7, C4
SR 385-310-1
ATP 21-1
Range Regulations, Fort Jackson

3. PROCEDURE:

a. Period 1 (2 Hours):

(1) Subject: Range Estimation.
(2) Text References: FM 23-5, pars 120-124.
(3) Equipment: Blackboard; Range Chart; Paper and pencil for each trainee; Chart - Factors effecting estimation by eye.
(4) Area: Range Estimation Course.
(5) Procedure: Explain the importance of estimating range accurately. Explain each of the methods employed in estimating ranges (Use of tracers, observation of fire, estimation by eye). Conduct the practical work exercises described in FM 23-5, par 124.

b. Period 2 (1 Hour):

(1) Subject: Setting Sights Rapidly; Stoppages; Immediate action.
(2) Text Reference: FM 23-5, pars 35-38, 66.
(3) Area: Out-of-doors.
(4) Procedure: Review sight setting and changes. Explain the importance of setting sights rapidly. Conduct practical exercises in setting sights rapidly. Review stoppages and immediate action.

c. Period 3 (1 Hour):

(1) Subject: Assuming Positions Rapidly; Assault Fire.
(2) Text References: FM 23-5, pars 65c, 138.
(3) Equipment: Type "E" and "F" silhouette targets. 2 EE8 telephones; Blackboard; whistles.
(4) Area: Out of Doors.
(5) Procedure: Review firing positions; Conduct explanation, demonstration and practical work in assuming positions rapidly. Conduct practical exercises requiring soldiers to estimate ranges, set sights, assume a firing position, and simulate firing at silhouette targets which are exposed for brief intervals. Explain, demonstrate, and conduct practical work in assault fire position procedure.

ANNEX #24

d. Period 4 (8 Hours):

(1) Subject: Transition Firing.
(2) Text References: FM 23-5, C1 and 2, pars 69d-g, 189, 191e.
(3) Personnel: Officer personnel requirements in sub par below are for ideal conditions. Minimum number for firing this range are:

Table VI and VII - 1 Officer
Table VIII - 1 Officer
Table IX - 1 Officer

(a) Table VI:
Officers: Two (2) Range Officers
Cadremen: Six (6) Asst Range Officers(Scorers)
Trainees: Fifty-four (54) Target Operators; two (2) ammunition bearers; one (1) Latrine Orderly; Six (6) Coaches

(b) Table VII:
Officers: Two (2) Range Officers
Cadremen: Four (4) Asst Range Officers
Trainees: Two (2) Target Operators; One (1) ammunition bearer; Four (4) Coaches

(c) Table VIII:
Officers: One (1) Range Officer
Cadremen: Four (4) Asst Range Officers
Trainees: Two (2) target operators; One (1) ammunition bearer; Four (4) Coaches

(d) Table IX:
Officers: One (1) Range Officer
Cadremen: Four (4) Asst Range Officers(Coaches)
Trainees: Four (4) target operators, One (1) ammunition bearer.

(e) Stations 1, 1A, 2 3, 4, 5, and 6:

One Orientation and Critique Non-commissioned officer for each station. Use table model of range.

(4) Equipment:

(a) Table VI; 72 targets
26 EE8 telephones
54 red flags
18 whistles
18 buckets suitable for bailing water.

(b) Table VII; 32 targets
27 telephones
2 whistles
24 red flags
8 buckets suitable for bailing water.

(c) Table VIII; 4 targets
2 telephones
1 red flag
1 bucket suitable for bailing water.

(d) Table IX; 1 red flag
16 clips adapted to hold 4 rounds.

(e) Station # 1 - Sight Blackening Equipment (Unit responsibility).
2 - Blackboards
3 - Blackboards
4 - Blackboards
5 - Blackboards and cleaning materials (Unit Responsibility)
1A - Clips of dummy ammunition.

Authority NND 947000
By CO NARA Date 3-22-04

(5) Area: Transition Range.

(6) Procedure: (See Annex # 3).

For Firing Line and Stations in Rear of Firing Line:

(a) Pit detail and coaches will precede firing personnel to the range by 40 minutes.

(b) Equipment Area: Direct troops to remove and align packs and excess equipment. Direct firing personnel to Station # 1.

(c) Station # 1: Review Safety Regulations in general and those peculiar to the Transition Range (FM 23-5, par 191). Orient soldiers on the course to be fired. Direct twelve (12) trainees to Table VI (6 wet firing and six (6) dry firing).

(d) Table VI: Conduct firing of Table VI as prescribed in Annex # 1. Require the dry firers to follow the course simultaneously with the actual firers. Direct personnel to Station # 2. Present score sheets to Critique Officer.

(e) Station # 2: Critique Firing. Direct personnel who display noted deficiencies to Station # 1A for additional instructions. Orient personnel on Table VII. Direct personnel to Table VII. Present scorers with score sheets.

(f) Table VII: Conduct firihg of Table VII as prescribed in Annex # 1. Require dry dirers to fire the course simultaneously with the actual firers. Direct personnel to Station #3. Present score sheets to Critique Officer.

(g) Station #3: Critique Firing. Direct personnel who failed to qualify to Station # 1A for further instruction. Orient personnel on Table VIII. Direct personnel to Table VIII. Present scorers with score sheets.

(h) Table VIII: Conduct firing of Table VIII as prescribed in Annex # 1. Require firer to "stand fast" between shots. No dry firing will be done. Direct personnel to Station # 4. Present score sheets to Critique Officer.

(i) Station # 4: Critique firing. Direct personnel who failed to qualify to Station # 1A. Orient personnel on Table IX. Direct personnel to Table IX. Present scorer (coach) with score sheets.

(j) Table IX: Conduct firing of Table IX as prescribed in Annex #1, (also see Annex # 4). No dry firing will be done. Direct personnel to Station #5. Present score sheets to Critique Officer.

(k) Station # 5: Critique firing. Direct personnel who failed to qualify to Station # 1A. Inspect rifles and search men for live ammunition. Require men to clean rifles. Inspect rifles for cleanliness. Direct men to Station # 6.

(l) Station # 6: Orient men on duties of target operators or coaches. Relieve target operators or coaches of a complete lane when sufficient personnel arrives.

(m) Station # 1A: (This Station may be incorporated with Station # 1 if desired)
Concurrent instruction will be presented on: Rapid setting of sights. Assuming firing position quickly. Rapid loading. Immediate action. Firing from sitting and kneeling positions. Firing

DECLASSIFIED
Authority NND 947020
By CO NARA Date 3-22-01

from "off-hand" and "hip-firing" positions. Officer in charge of training will replace men in flow when he believes them able to qualify.

For Pits:

(n) Tables VI, VII and VIII:
The officer in charge of the control tower for each table will:

Supervise instruction of pit detail.
Supervise drawing of targets and red flags.
Demonstrate the operation of a pit to include target operation and communication.
Supervise the installation of the pit detail in their respective pits.
Conduct sufficient number of dry runs to insure both efficient and safe operation.

(o) Table IX - The range officer in charge of this Table will orient and supervise the operation of this detail. Upon completion of firing this exercise, and upon signal by the coach, the target operator will assist in scoring and pasting the hits with the coach.

4. MISCELLANEOUS:

a. Targets are fastened to staves and are operated by men protected in individual pits.

b. At firing points for Tables VI and VII, the following men are the only authorized personnel at each point.

1 Firer (Dry Run) 1 Firer (wet) 1 Telephone Operator
1 Coach (dry run) 1 Coach (wet) 1 Asst Range Officer

c. Coaches:

(1) The coaches in Tables VI and VII will set-off the sights of all men under their control sufficiently to require an adjustment. This adjustment will be accomplished by the firer after he has taken his firing position.
(2) The coach will enforce safety regulations.
(3) The coach will observe firing technique.
(4) The coach will note errors on the score sheet.
(5) The coach will observe dry firers (where applicable) and make any necessary corrections.

d. During Table VIII and IX, "Battle Sights" will be set and left there during the entire course.

e. Pits: Pits will not be used as latrines.
Pits will be policed at the completion of each day's firing.

f. Scores: Score sheets (See Annex #2) will be reproduced by units concerned.

ANNEX # 1

TO

INSTRUCTION ON THE PROCEDURE IN
THE USE OF RIFLE TRANSITION RANGE # 1

1. Courses:

Table VI:

RANGE (YARDS)	TIME	SHOTS 1	TARGET 2	POSITION	SLING
200	60 Secs	5	3E	Kneeling or Sitting From Standing	Loop
300	60 Secs	5	3E	Prone from Standing	Loop
500	60 Secs	5	3E	Prone from Standing	Loop

1. The rifle is to be loaded with a partial clip containing five rounds.
2. Targets should be approximately five yards apart and as near the prescribed range as terrain permits.

Table VII:

RANGE 1 (YARDS)	TIME SECONDS	SHOTS 2	TARGET	POSITION	SLING
	120	10	6E	Prone from Standing	Loop

1. Two targets between ranges of 200 and 300 yards, two targets between 300 and 400 yards, and two between 400 and 500 yards. Each pair of targets will be staggered and separated in depth from 25 to 50 yards.
2. The rifle is to be loaded initially with a partial clip of two rounds and reloaded with a full clip.

TABLE VIII:

RANGE (Yards)	Time 1 Seconds	Shots 2	TARGET	POSITION	SLING
100	3 Secs per Round	5	E	Standing	None

1. Target will be exposed for 3 second period during which rifle will be brought to the shoulder and round fired.
2. Rifle is locked and loaded before start of exercise.
3. Rifle is held at the ready and brought to the shoulder for firing each round.

TABLE IX:

PHASE LINES	TARGETS SINGLE	DOUBLE	TRIPLE	RANGE (YARDS)	SHOTS	TARGET	POSITION	SLING
2-3	2	1	0	5-70	4	E	Off-hand	None
3-4	0	1	2	5-70	8	E	Hip	None
4-Final	2	3	0	5-70	8	E	Off-hand	None

DECLASSIFIED
Authority NND 997000
By CO NARA Date 3.22.04

Annex 1 to Instruction on the Procedure in the Use of Rifle Transition Range # 1 (contd)

a. A single silhouette represents an enemy rifleman.
A double silhouette represents an enemy automatic rifle team.
A triple silhouette represents an enemy machine gun.

b. Targets will be exposed in sequence upon signal from the coach.
Time of exposure of targets is as follows: (a) Single silhouettes, 3 seconds. (b) Double silhouettes, 4 seconds. (c) Triple silhouettes, 5 seconds.

c. Phase lines are placed after the 4th, 12th, and 20th targets to assist in the enforcement of safety precautions. (See Annex # 1.)

d. Firer starts from the prone position, with rifle locked, 4 rounds in the rifle, and two, 8 round clips in his belt.

e. On signal from the range officer, the firer rises and moves down the lane on the alert. As targets are exposed the firer fires one round at each silhouette between phase lines two and three from the "Off Hand" position. He then reloads and fires from the "Hip" firing position at each silhouette between phase lines three and four. He reloads again and fires from the "Off Hand" position at each silhouette between the fourth and final base lines.

f. A coach accompanies each firer, to insure control, to assist the range officer and to critique the firer at the end of his firing.

g. Safety Precautions:
The firer will be instructed prior to firing that targets are not more than 3 feet high, targets will be on same level as ground, targets to front, right or left front only.

2. Scoring:

a. Table VI:
For each target hit . . . . . 1 Point
For each unexpended round if all targets are hit. . . . 1 Point

b. Table VII: For each target hit
Between 200 and 300 Yards . . . . . 1 Point
Between 300 and 400 Yards . . . . . 2 Points
Between 400 and 500 Yards . . . . . 3 Points
For each unexpended round if all targets are hit. . . 3 Points

c. Table VIII:
For each target hit . . . . . 1 Point

d. Table IX:
For each target hit . . . . . 1 Point
For each unexpended round if all targets are hit. . . . 1 Point

e. Satisfactory Scores:

Table	Satisfactory Score
VI	Not applicable
VII	8
VIII	4
IX	8

April 10, 1951

HEADQUARTERS 31ST INFANTRY DIVISION
Office of The AC of S, G-2
Fort Jackson, S. C.

DDACB 10 April 1951

1. INTELLIGENCE TRAINING:

a. Twenty-One (21) officers and one hundred eight (108) enlisted men, division intelligence personnel, are currently attending Intelligence Courses at The Army General School, Fort Riley, Kansas and other service schools. Quotas have been approved for three (3) officers and fifty (50) enlisted men to attend intelligence courses at The Army General School commencing 25 April 1951.

b. All Division personnel are currently receiving Intelligence Training in accordance with appropriate ATP's.

c. A Division Intelligence School will be conducted during Unit Training Cycle, 11 June to 20 August 1951 inclusive.

2. AGGRESSOR:

a. Uniforms: There are approximately four hundred (400) AGGRESSOR Uniforms, complete with all accessories currently available for issue. Requisition for eleven hundred (1100) additional uniforms has been approved. 31st Division Quartermaster will coordinate issue of all AGGRESSOR Uniforms through the AC of S, G-2.

b. Simulation Equipment and Ammunition: Simulation Equipment and Ammunition have been requisitioned for use in AGGRESSOR Training.

c. AGGRESSOR Training:

(1) All AGGRESSOR training will be supervised and coordinated by AC of S, G-2.

(2) The AGGRESSOR Team from AGGRESSOR Headquarters, Fort Riley, Kansas, will present a demonstration for 31st Infantry Division 29 April - 5 May 1951 inclusive.

3. CLEARANCES:

Immediate Access clearances for access to TOP SECRET matter have been processed for the General Staff. Interim clearances for access to Secret matter have been processed for two hundred (200) officers and enlisted men of this division. Seven hundred eighty-five (785) Personal History Forms of division personnel have been processed to date. Cryptologic Clearance Requests have been processed for twenty-five (25) officers and enlisted men.

CONDENSED TRAINING REPORT

1. Pre-cycle (cadre) training was completed on March 3rd and on March 5th this division started basic training with a strength of approximately 21,000; all fillers having been received in time to start on schedule. Training progressed according to Master Training Program for National Guard Divisions, dated October 1950, until 23 March, when we were directed to complete PCR qualifications in 14 weeks. A revised schedule was issued and all units are now in the 6th week of basic training.

2. FACTORS AFFECTING TRAINING:

a. SHORTAGE OF TRAINED PERSONNEL:

(1) As of 10 April 1951 this division had 416 officers and 660 enlisted men in attendance at service schools off the post. 385 enlisted men are attending schools on the post. It is believed the handicap created by this situation will be more than repaid when these school trained personnel return to the division.

b. INSUFFICIENT TRAINING AREAS:

(1) While much has been said about securing additional maneuver area the fact remains that we are reaching that stage of training where more maneuver area is required than is now available. The leasing of the proposed strip South of the reservation will remedy this situation.

c. FACILITIES:

(1) A definite shortage exists in transition ranges, close combat ranges and combat in cities courses. The division has initiated action to construct two additional close combat ranges with its own forces and thus solve one problem. By firing Saturdays and Sundays we can complete transition firing. But we cannot complete combat in cities fighting in the required time unless given priority on the course.

(2) There is a shortage of class room space, ordnance shop facilities and storage space.

(3) The original Field Artillery range was inadequate. Current negotiations with post may correct this situation.

(4) There is no range available for AAA firing, nor 90MM tank firing.

DECLASSIFIED
Authority 54 7030
By CS NARA Date 3/23/07

HEADQUARTERS 31ST INFANTRY DIVISION
Office of AC of S, G-4
Fort Jackson, South Carolina

10 April 1951

SUBJECT: Supply Status, 31st Infantry Division

TO : Chief of Staff

1. One of the major problems is lack of Tactical Vehicles, especially for the 31st Division Artillery, in connection with Service Practice RSOP's being conducted. A letter has been written to the Commanding General, Ft. Jackson, South Carolina, in reference to this subject.

2. Division Artillery is authorized 100% TO&E on 155 and 105 Howitzers, which are on requisition, but is only authorized 30% on Prime Movers for said weapons. A letter was written to Commanding General, Ft. Jackson, requesting 100% TO&E for Tractors, High speed, 13 Ton M5A3, Prime Movers, also. Post has submitted requisitions on above basis.

3. Bayonets are issued on basis of one (1) per Rifle M-1 up to full TO&E strength, and one (1) per ten (10) men for balance of fillers. It is recommended that Bayonets be issued on the basis of one (1) per Rifle M-1 authorized. Knives, Bayonet M-4 are authorized on basis of one (1) per ten (10) Carbines. It is recommended that knives be issued on a basis of one (1) per Carbine.

4. Suspenders and Combat Packs are in short supply. General Sullivan called Army Field Forces to ascertain status of these items, during his visit with the 31st Division last week. General Sullivan indicated that these items would be available at an early date.

5. There has been a critical shortage of Combat Boots, but it is believed that each individual within the Division has at least one (1) pair of issue footwear. Said supply is improving gradually.

6. Steel Helmets were in short supply, but POst received 6,000 yesterday, which should practically complete requirements of the 31st Division.

7. The 31st Division is vitally in need of class room facilities. A letter has been written to Commanding General, Ft. Jackson, requesting ten (10) assembly tents be issued this Division for said purpose.

DECLASSIFIED
Authority 94-7020
By CSMRA Date 8/23/07

8. As mentioned in Par 1, lack of vehicles within the Division is one of the shortages that affect training, but this Division has received copies of Shipping Documents, covering 132, 2½ Ton, 6x6, M-34 Trucks, and a copy of a telephone conversation which indicates an additional allotment of 238 Trucks.

9. With exception of aforementioned items, the supply status of the Division as a whole is satisfactory.

Clifford P Morrison

CLIFFORD P MORRISON
Lt. Col. GSC
AC of S G-4

DECLASSIFIED
Authority 54 7030
By CSKRA Date 8/23/07

REDUCED TABLE OF ORGANIZATION

The 31st Division is organized under the reduced strength Table of Organization for an Infantry Division. This Division has approximately 50% overstrength in enlisted men. There are 416 officers away at Army Field Forces' Schools. It was determined that it would be far better to have the Division weak in the beginning and strong in the end as a policy, and therefore a determined effort was made to fill every available quota. Naturally with a reduced T/O strength in officers, further reduced by officers attending school, the problem of training has placed a tremendous burden on those officers remaining. They have accepted this challenge willingly.

It is recommended that an Infantry Division be allowed the full T/O strength in officers. The following list contains the minimum number of officers which should be restored to the T/O in the event the full T/O is not allowed:

Division Headquarters - 3 Capt. Assistants for the G-2 and G-3 Sections, 1 Lt. Postal Officer.

QM Co - 1 Lt. Platoon Leader.

Signal Co - 1 Lt.,Message Center.

Div. Arty. Hq. - 1 Capt. Liaison

AA AW Bn Hq. - 1 Capt. Adjutant

AA AW Btrys - 2 Lts. each

Engineer Bn. Hq. - 1 Capt. and 3 Lts. (Adjutant, Assistant S-2, Assistant S-4 Liaison Officer).

Engineer Co. - 1 Platoon Leader

155 MM FA Firing Btrys - 1 Lt. each.

105 MM FA Btrys - 1 Lt. each Firing Btry.

Infantry Bn. Hq. - 1 Capt. Adjutant and 1 Lt. Motor Officer.

Infantry Tank Co. - 2 Lts. Platoon Leaders.

Tank Bn. Hq. - 1 Capt. Adjutant

Tank Bn. Companies - 2 Platoon Leaders each.

Appendix C: Interview Records

Interview Record

Project:	Military Munitions Response Program - Site Inspection
Site:	Fort Jackson, SC
Contract No.:	DACW41-02-D-0003
Delivery Order:	DA02
Date:	16 June 2004
Interview By:	Susan Burtnett/Leigh Blake
Person Interviewed:	Mark Dutton, Natural Resource Specialist Fort Jackson Wildlife Office

Discussion:

Mark Dutton provided information regarding cultural resources at Fort Jackson. He provided GIS maps showing archeological/cultural resource sites (both eligible and ineligible sites).

The maps showed cemeteries located at the installation. Other than a cemetery located north of the Hand Grenade Court No. 2 and the Rifle Grenade Range NR2 in the Weston Lake Area (on the east side of Washington Light Infantry Road), no cultural resources were identified in the other that operational areas evaluated as part of the HRR.

Duded areas were also shown on the maps. These areas are noted so the natural resource staff were aware of the areas at the installation where they are not allowed to enter due to the potential to encounter UXO.

In the Cantonment Area, the area adjacent to Chestnut Road was not surveyed because it was determined to be too disturbed to do a routine cultural resources survey. The forested areas in the Cantonment Area (i.e., the areas where the 600-Yard, 1000-Yard and Machine Gun Ranges and Live Hand Grenade Court 2 are located) have been surveyed. Mark noted that everything east of Chestnut Road has been surveyed, except for areas were structures have been constructed and an irregular shaped area south/southeast of Hilton Field that was shown as duded on an archeological inventory map dated 1990. (Note: this area is not shown as duded on any other maps reviewed.)

The majority of the area near and including Fort Jackson Flight Club (FJFC) was surveyed, with the exception of the duded area adjacent to and east of the FJFC. No potentially eligible or eligible sites were found (surveyed).

The Weston Lake Area, including the areas where the CTT sites (the Mortar Range, Submachine Gun Area, and Hand Grenade Court No 2) are located, has been surveyed. The only cultural resource site identified was the Brazelle cemetery located north of the Rifle Grenade Range NR2. The Rifle Grenade Range NR2 was not surveyed because it is shown as duded on installation maps. The installation maps actually show 3 separate duded areas identified as Rifle Grenade/Hand Grenade/Rifle Grenade in this area.

Interview Record

Project:	Military Munitions Response Program - Site Inspection
Site:	Fort Jackson, SC
Contract No.:	DACW41-02-D-0003
Delivery Order:	DA02
Date:	16 June 2004
Interview Made By:	Susan Burtnett/Leigh Blake
Person Interviewed:	Lahiri Estaba, IRP Manager Fort Jackson Environmental Department

Discussion:

Lahiri Estaba provided information regarding Fort Jackson's Installation Restoration Program (IRP) and the sites located near the MMRP ranges/sites where environmental investigations (soil/groundwater sampling) have been conducted. He also provided copies of relevant IRP documents for the team's use.

SWMU 1 (Sanitary Landfill No. 3) and SWMU 34 (Building 2183, Vehicle Wash Pad and Oil Water Separator) are located east/northeast of the Cantonment Area MMRP sites/ranges. In addition, background soil (surface and near-surface) samples were collected near this area. B-6 was obtained approximately ½ mile north of the 1000-Yard Range along Chestnut Road and B-5 was obtained approximately ½ mile south of the 1000-Yard Range.

There are no IRP sites near the FJFC (nothing within at least 5 miles).

SWMU 17 (Inchon OB/OD) is located approximately 5 miles east of the Mortar Range and Submachine Gun Area. Two phases of RFI have been completed and conditional approval has been received from the State. Mr. Estaba noted that the reports have good general soils and groundwater information.

SWMU 21 (Inactive Range 17 Landfill) is also located approximately 5 miles east of the Mortar Range and Submachine Gun Area. Groundwater monitoring has been conducted at this site.

There are no IRP sites west of Weston Lake (i.e., nothing near the Hand Grenade Court No. 2 and Rifle Grenade Range NR2).

Interview Record

Project:	Military Munitions Response Program - Site Inspection
Site:	Fort Jackson, SC
Contract No.:	DACW41-02-D-0003
Delivery Order:	DA02
Date:	June 16, 2004
Interview Made By:	Susan Burtnett/Leigh Blake
Person Interviewed:	John Maitland, Lead Forester Fort Jackson Forestry Office

Discussion:

Mr. Maitland was familiar with the areas where the MMRP sites/ranges are located, especially the sites west of the Weston Lake Area. He provided historical aerial photographs of the different sections of the installation where the MMRP sites/ranges are located (from the Forestry Office aerial photograph collection). During a follow-up site visit in July, relevant portions of the aerial photographs were copied and they served as a primary source of site-specific information for the HRR.

The area east/southeast of the Cantonment Area sites/ranges has been logged and replanted with pines at least once in the past.

Recently, slash pines have been planted at and east/southeast of the FJFC.

The sites/ranges located west of Weston Lake (the Hand Grenade Court No. 2 and Rifle Grenade Range NR2) have been surface cleared. Recently, the Rifle Grenade Range NR2 was logged (the area south of the cemetery was logged).

Mr. Maitland noted that there were inconsistencies in how the hand grenade and rifle grenade ranges are shown on the installation maps over the years. The team talked with him about the different ways the ranges are shown. The CTT Inventory identified one range (Rifle Grenade Range NR2), but the previous installation maps show three separate ranges in this area.

The CTT Inventory map shows the Hand Grenade Court No. 2 by Fire Break 12. Mr. Maitland did not remember anything in that area. He noted that is has been logged twice. Slash pine has been planted (Slash pine plantation in the 1970s) and the soil has been significantly disturbed down to at least one foot. This is also the case at the Rifle Grenade Range NR2 where logging has taken place.

Based on review of the aerials, it doesn't look like there was any range activity north of Fire Break 9. The area north of Fire Break 9 has been planted with slash pine, as well.

Interview Record

Project:	Military Munitions Response Program - Site Inspection
Site:	Fort Jackson, SC
Contract No.:	DACW41-02-D-0003
Delivery Order:	DA02
Date:	17 June 2004
Interview Made By:	Susan Burtnett/Leigh Blake
Person Interviewed:	SSGT Mark Wood Fort Jackson Range Control

Discussion:

SSGT Wood escorted the data collection team during a limited visual survey of several of the ranges. These included:

- Fort Jackson Flight Club (FJFC)
- Hand Grenade Court No. 2
- Rifle Grenade Range NR2

SSGT Wood provided general descriptions of current uses in the vicinity of these ranges. He noted that the FJFC is used by a club for flying remote controlled model airplanes. The area near the Rifle Grenade Range NR2 has Red Cockaded Woodpecker habitat. He did not have knowledge of historical range use since he has been at Fort Jackson for only the last 3 years.

Interview Record

Project:	Military Munitions Response Program - Site Inspection
Site:	Fort Jackson, SC
Contract No.:	DACW41-02-D-0003
Delivery Order:	DA02
Date:	18 June 2004
Interview By:	Susan Burtnett/Leigh Blake
Person Interviewed:	Jim McCracken, NEPA Coordinator Fort Jackson Environmental Department

Discussion:

Jim McCracken provided information regarding the past use of other than operational ranges in the Cantonment Area, the Fort Jackson Flight Club, and the Weston Lake Area.

Cantonment Area
The ranges used during the time period when the installation was Camp Jackson were discussed. These included the 1000-Yard, 600-Yard, 300-Yard, and Machine Gun Ranges. Mr. McCracken noted that the Baseball Field and Soccer Field were constructed in the area where these ranges were located in approximately 1980. The elementary school was constructed later.

Fort Jackson Flight Club (FJFC)
There were several ranges that existed in the area of the FJFC. In addition to the machine gun range, there was a 40mm range north of the area currently used by the FJFC.

Weston Lake Area
The Mortar Range, Submachine Gun Area, Rifle Grenade Range NR2, and Hand Grenade Court No. 2 were discussed. The team noted that the Rifle Grenade Range NR2 is shown differently depending on the map reviewed.

Mr. McCracken noted that there was a long wall located behind the commissary, behind the officer housing area, that he had been told may have been used as a range. Note: the team walked this area on a return site visit in July. The team walked along the wall and noted no bullet holes in the concrete or other visual signs of use as a range. The team did note that the area east of the wall was planted with bamboo at some time in the past. The bamboo plants were well established.

Mr. McCracken provided the data collection team with a map showing the Cantonment Area (Cantonment Area, Fort Jackson, SC, Sheet 1 of 3, September 1945, Army Map SVC, War Department). He also noted that an area located south of Hilton Field was shown on a 1990 map, but this area was not identified on any other maps.

Interview Record

Project:	Military Munitions Response Program - Site Inspection
Site:	Fort Jackson, SC
Contract No.:	DACW41-02-D-0003
Delivery Order:	DA02
Date:	18 June 2004
Interview By:	Susan Burtnett/Leigh Blake
Person Interviewed:	Jim Wyatt, Range Control Officer Fort Jackson Range Control

Discussion:

Mr. Wyatt provided maps and other documents (including range sketches) regarding the MMRP ranges/sites. The team discussed the historical range uses and range locations in the following areas:

Cantonment Area:
Mr. Wyatt noted that the area where the Live Hand Grenade Court 2 is located was used for Field Fortification training in the 1970s and 1980s. As such, the area has been significantly disturbed since its use as a hand grenade court.

The team discussed the 300-Yard Range that was identified on archival documents obtained as part of the HRR. Mr. Wyatt agreed that this appears to be an additional range used in the Cantonment Area in the early 1900s.

FJFC:
Mr. Wyatt provided information regarding use of this area as the Saint Lo Range and Salerno Range. The Saint Lo Range was used in 1965 as a combat indoctrination (C/I) range, not as a machine gun range. Later it was converted to the machine gun range. The Salerno Demonstration Range was depicted on a range sketch provided by Mr. Wyatt.

Weston Lake Area:
Mr. Wyatt agreed with the team that the Hand Grenade Court No. 2 and Rifle Grenade Range NR2 are inconsistently shown on installation maps. Review of historical maps and aerial photographs with Mr. Wyatt indicated that hand and rifle grenade use occurred east of Washington Light Infantry Road in the areas where these sites are located.

Historical photographs were reviewed by Mr. Wyatt. Mr. Wyatt noted that he was at Fort Jackson from 1956 – 1966.

He noted that in 1958 training at the installation was moved north so it was centrally located. Everything to the east was closed and the direction of fire was directed that way.

Interview Record

Project:	Military Munitions Response Program - Site Inspection
Site:	Fort Jackson, SC
Contract No.:	DACW41-02-D-0003
Delivery Order:	DA02
Date:	28 July 2004
Call Made By:	Leigh Blake
Person Called:	Jim Murphy (803) 751-5614 Fort Jackson Engineering Office

Discussion:

During a telephone conversation, Leigh Blake spoke to Jim Murphy about the 1957 Basic Information for Master Plan, Range, and Training Areas Map (June 1, 1957) that he provided to the team during the Phase 3 CTT Inventory data collection site visit. The map legend on the copy of the map that the data collection team had obtained is faded in several areas. We needed clarification on the missing information for the HRR. Mr. Murphy stated that he would look for the map to see if he could find a better copy.

Note: Ms. Blake followed up with a call to the Fort Jackson Museum (Ms. Bessie Williams and Mr. Fred DeMag) where she was able to obtain the missing information by telephone as museum personnel looked at the copy of the map and helped interpret/convey the missing information. Ms. Williams and Mr. DeMag were also helpful during the site visit in providing historical documents and maps for review while the team was at the Fort Jackson Museum.

Interview Record

Project:	Military Munitions Response Program - Site Inspection
Site:	Fort Jackson, SC
Contract No.:	DACW41-02-D-0003
Delivery Order:	DA02
Date:	30 July 2004
Call Made By:	Leigh Blake
Person Called:	Tom Peel (803) 751-7261 Fort Jackson Real Property Office

Discussion:

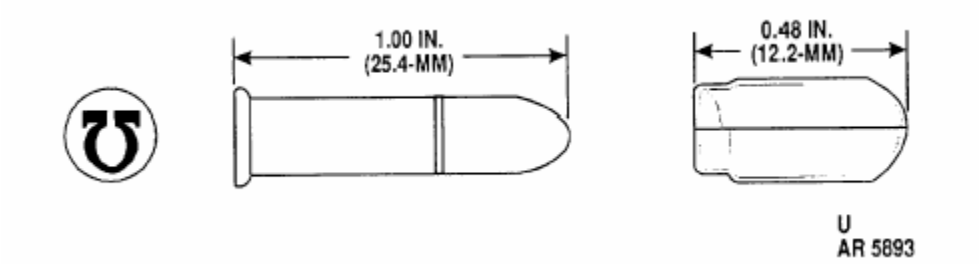
During a telephone conversation, Leigh Blake spoke to Tom Peel about Real Property records for range use and range closure dates. Mr. Peel stated that Leigh would need to speak with Jim Wyatt at Range Control for that information. He stated that he did not have information on ranges.

Mr. Peel noted that there have been no property boundary changes associated with the team's area of interest.

Appendix D: Munitions Technical Data Sheets

Ordnance Technical Data Sheet

.22 Caliber Small Arms



Nomenclature: .22 Caliber Small Arms Ammunition
Ordnance Family: Small Arms
DODIC: A086
Filler: None
Filler weight: None
Item weight: 416 g (416 grain)
Diameter: 5.58 mm (.22 in)
Length: 25.40 mm (1 in)

Usage: Sub-caliber Rifle M2A1; Caliber .22 Rifle; Remington Models 40X and M513T; Steven's Model 416-2; Winchester Models 52 and 75; Machine Gun Trainers M3 and M4; pistols for gallery practice and training purposes. The cartridge is intended for use against small game for survival purposes.

Description: BALL Cartridge. The cartridge is identified by a plain bullet tip.

Reference: Army Technical Manual, TM 43-0001-27

Ordnance Technical Data Sheet

U.S. Carbine Cartridge, .30 Caliber, Ball

Nomenclature: U.S. Carbine Cartridge, .30 Caliber, Ball
Ordnance Family: Small Arms
DODIC: Not Provided
Filler: None
Filler weight: None
Item Weight: Not Provided
Diameter: 7.62 mm (.30 in)
Length: 42.67 mm (1.68 in)

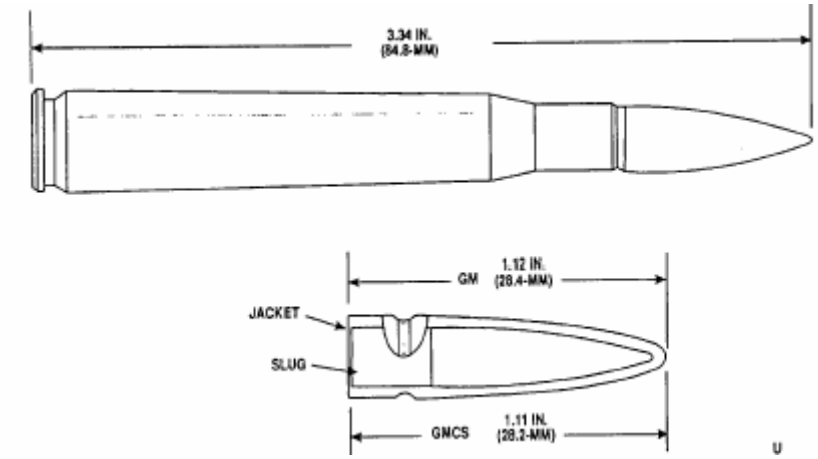
Usage: Standard general purpose small arms ammunition for the M-1 and M1A1 Carbine. The maximum range is 2,012 meters or 2,200 yards.

Description: BALL Cartridge. Ball ammunition is unpainted; tracer ammunition has the tip painted either orange or red.

Reference: Army Technical Manual, TM-9-1300-200.

Ordnance Technical Data Sheet

.30 Caliber Small Arms



Nomenclature:	.30 Caliber Small Arms Ammunition
Ordnance Family:	Small Arms
DODIC:	A212
Filler:	None
Filler weight:	None
Item weight:	26.96 g (416 grains)
Diameter:	7.62 mm (.30 in)
Length:	84.80 mm (3.34 in)

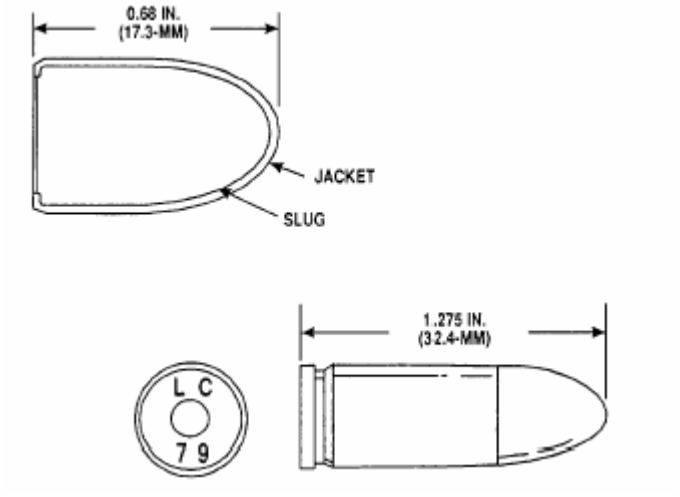
Usage: Machine Guns, Caliber .30, M37, M1919A4 and M1919A6; Rifle, Caliber .30, M1. The cartridge is intended for use against personnel or unarmored targets.

Description: BALL Cartridge. The cartridge is identified by a plain bullet tip.

Reference: Army Technical Manual, TM 43-0001-27

Ordnance Technical Data Sheet

Cartridge Ball .45 Caliber M1911



Nomenclature:	Cartridge Ball .45 Caliber M1911
Ordnance Family:	Small Arms
DODIC:	Not Provided
Filler:	None
Filler weight:	None
Item weight:	332 gr (11.32 oz)
Diameter:	11.43 mm (.45 in)
Length:	32.4 mm (1.275 in)

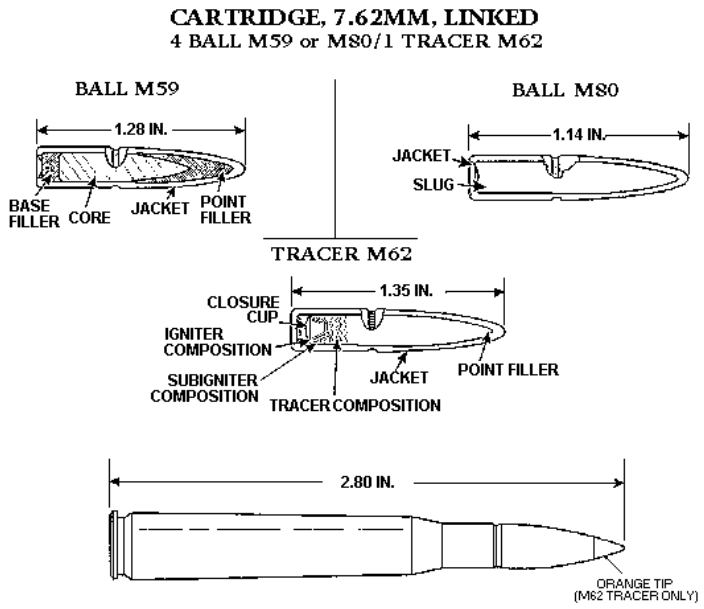
Usage: Submachine Gun, Caliber .45 M3A1; Pistol Caliber .45, M1911A1. The cartridge is intended for use against personnel.

Description: BALL Cartridge. The cartridge is identified by a plain bullet tip.

Reference: Army Technical Manual, TM-0001-27

Ordnance Technical Data Sheet

7.62MM Small Arms



Nomenclature:	7.62MM Small Arms Ammunition
Ordnance Family:	Small Arms
DODIC:	A138
Filler:	None
Filler weight:	None
Item weight:	376.5 g (13.2 oz)
Diameter:	7.62 mm (.3085 in)
Length:	71.12 mm (2.80in)

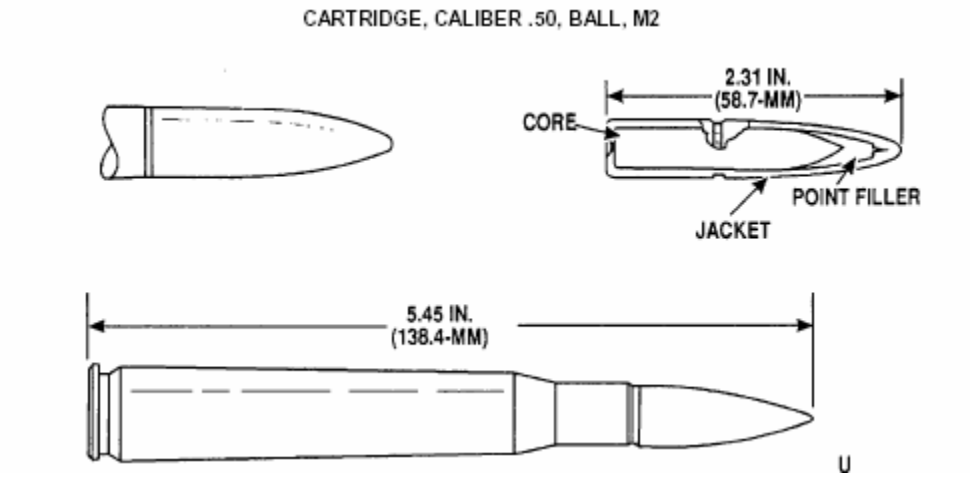
Usage: This cartridge is intended for use against personnel and unarmored targets.

Description: Full metal jacketed bullet and brass cartridge case. Center fired NATO standard small arms.

Reference: ORDATA Online; MIDAS; Army Technical Manual, TM-9-1306-200

Ordnance Technical Data Sheet

.50 Caliber Small Arms



Nomenclature:	.50 Caliber Small Arms Ammunition
Ordnance Family:	Small Arms
DODIC:	A552
Filler:	None
Filler weight:	None
Item weight:	117.50 g (.25 lb)
Diameter:	12.70 mm (.50 in)
Length:	138.40 mm (5.45 in)

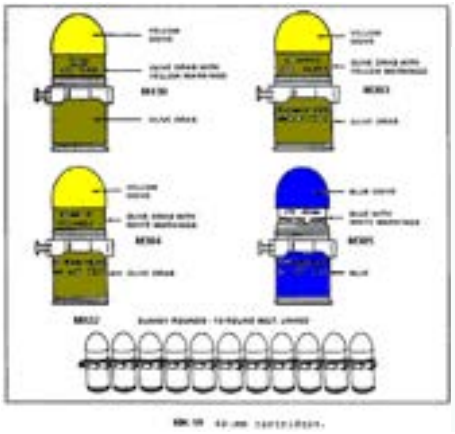
Usage: Machine Guns, Caliber .50, M2 and M85. The cartridge is intended for use against personnel or unarmored targets.

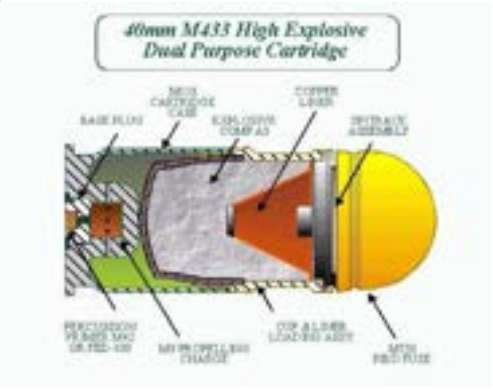
Description: BALL Cartridge. The cartridge is identified by a plain bullet tip.

Reference: Army Technical Manual, TM 43-0001-27

Ordnance Technical Data Sheet

40MM Grenade





Nomenclature: 40MM Grenade
Ordnance Family: Projectile
DODIC: B564
Filler: Explosive Composition A5
Filler weight: ± 57.00 g (2.011 oz)
Item weight: 340 g (11.99 oz)
Diameter: 40 mm (1.57 in)
Length: 79 mm (3.11 in)
Maximum Range: 400 m (437 yds)
Fuze: M550 (Impact Fuze)

Usage: Light Support Weapon. Providing capability for anti-personnel, anti-vehicle, anti-material, and training depending on type of round selected.

Description: The projectiles are olive drab with anodized gold ogives. The M383 has white markings; the M384 and M677 have yellow markings.

Filler Description: Composition A is a wax coated, granular explosive consisting of TDX and plasticizer wax. It is normally used as a bursting charge.

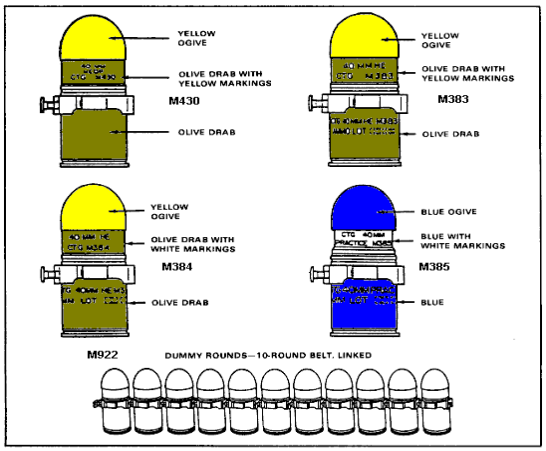
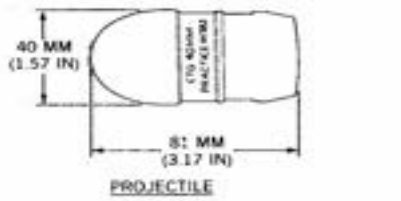
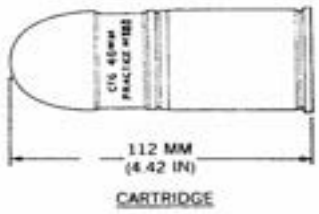
Ordnance Technical Data Sheet

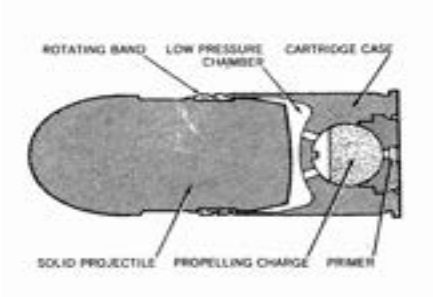
40MM Grenade Practice



MK-19 40-mm cartridges.







Nomenclature:	40MM Grenade Practice
Ordnance Family:	Projectile
DODIC:	B564
Filler:	None
Filler weight:	None
Item weight:	340 g (11.99 oz)
Diameter:	40 mm (1.57 in)
Length:	79 mm (3.11 in)
Range:	50 – 400 m (164 – 1312 ft)
Maximum Range:	400 m (437 yds)
Fuze:	None

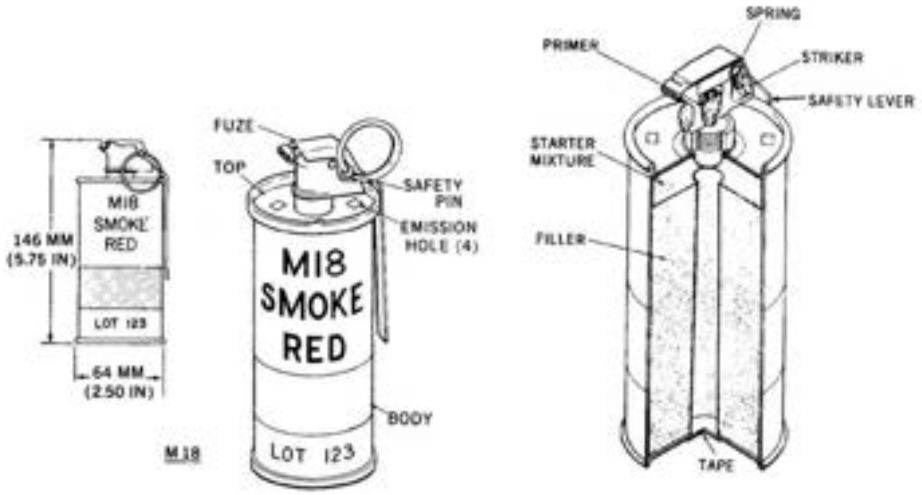
Usage: Light Support Weapon; In-service Training/Familiarization.

Description: The projectile is anodized blue with black markings.

Reference: ORDATA Online

Ordnance Technical Data Sheet

U.S. Grenade, Hand, Smoke, M18



Nomenclature:	U.S. Grenade, Hand, Smoke, M18
Ordnance Family:	Grenades
DODIC:	G955
Filler:	Smoke Mix, Colored
Filler weight:	326.03 g (11.5 oz)
Item weight:	539.00 g (19.01 oz)
Diameter:	64.00 mm (2.52 in)
Length:	146.00 mm (5.748 in)
Maximum Range:	Not Provided
Fuze:	Pyrotechnic, delay-igniting fuze (2 second delay)

Usage: The M18 is a hand-thrown smoke grenade that emits red, yellow, or violet smoke for 50 to 90 seconds. The M18 may also emit green smoke. These grenades use a pyrotechnic, delay-igniting fuze that provides an approximate 2 second delay.

Description: The M18 grenade may be olive drab with a light green band around the lower body and nomenclature and smoke color stenciled in light green, or light green and stenciled with the color of the smoke. The top of the grenade is painted the color of the smoke.

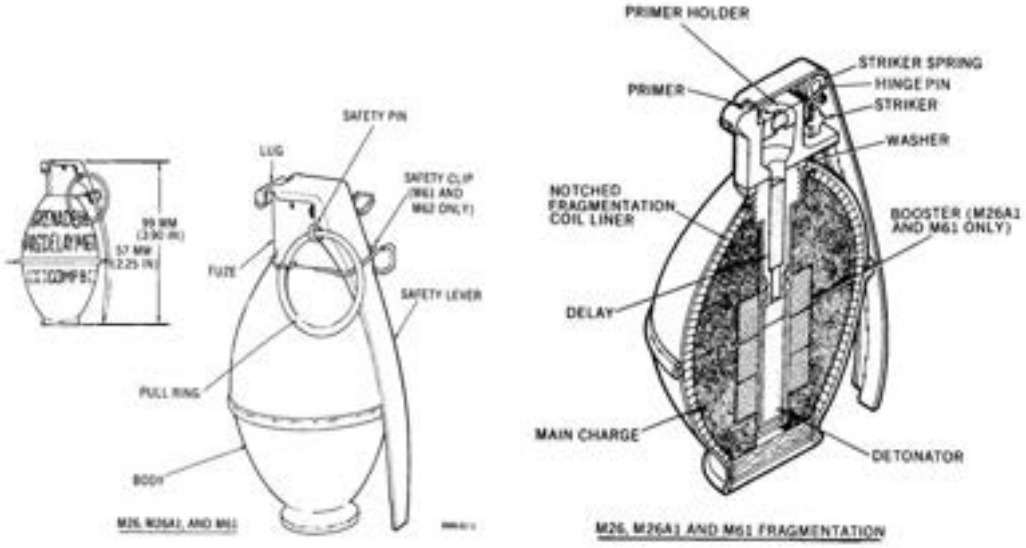
Ordnance Technical Data Sheet

U.S. Grenade, Hand, Frag, M26, M26A1, M61



Nomenclature:	Hand Grenade, Frag, M26, M26A1, and M61
Ordnance Family:	Grenades
DODIC:	G890
Filler:	Composition B
Filler weight:	164.43 g (5.8 oz)
Item weight:	453.60 g (15.98 oz)
Diameter:	57.00 mm (2.52 in)
Length:	99.00 mm (3.187 in)
Maximum Range:	40.00 m (43.7 yds)
Fuze:	Powder train time delay

Usage: The M26, M26A1, and M61 are fragmentation (frag), antipersonnel, delay-detonating hand grenades that have a notched fragmentation coil liner.

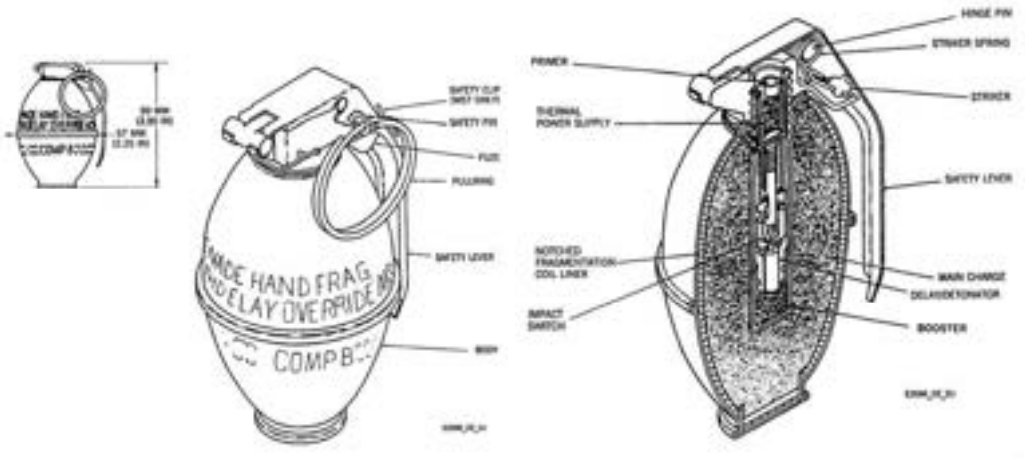
Description: The M26, M26A1, and M61 grenades are painted olive drab, with yellow markings stenciled on the body.

Filler (Main Charge) Description: Composition B consists of a mixture of TNT (trinitrotoluene) and RDX (cyclotrimethylenetrinitramine, cyclonite, and hexogen). It is used as a burster in Army projectiles, rockets, hand grenades, and landmines.

Reference: ORDATA Online

Ordnance Technical Data Sheet

U.S. Grenade, Hand, Frag, M26A2, M57



Nomenclature:	U.S. Grenade, Hand, Frag, M26A2 and M57
Ordnance Family:	Grenades
DODIC:	Not Provided
Filler:	Composition B
Filler weight:	155.93 g (5.5 oz)
Item weight:	454.00 g (16.01 oz)
Diameter:	57.00 mm (2.244 in)
Length:	99.00 mm (3.898 in)
Maximum Range:	40.00 mm (43.7 yds)
Fuze:	Powder Train Time-delay

Usage: These are fragmentation (frag), antipersonnel, delay-detonating, impact-actuated hand grenades that have a notched fragmentation coil liner.

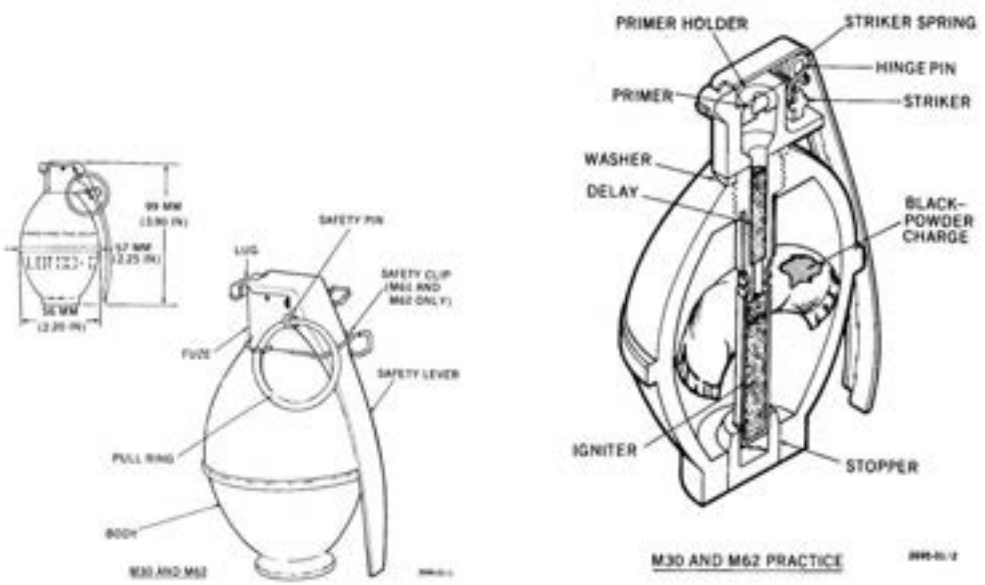
Description: The grenade is olive drab with markings stenciled in yellow. The safety lever is red. The word "IMPACT" is embossed on newer models and may or may not be stenciled in black on older models.

Filler (Main Charge) Description: Composition B consists of a mixture of TNT (trinitrotoluene) and RDX (cyclotrimethylenetrinitramine, cyclonite, and hexogen). It is used as a burster in Army projectiles, rockets, hand grenades, and landmines.

Reference: ORDATA Online

Ordnance Technical Data Sheet

U.S. Grenade, Practice, M30 and M62



Nomenclature:	U.S. Grenade, Practice, M30 and M62
Ordnance Family:	Grenades
DODIC:	G810
Filler:	Black Powder (Witness Charge Only)
Filler weight:	1.00 g (.03527 oz)
Item weight:	454.00 g (16.01 oz)
Diameter:	57.00 mm (2.244 in)
Length:	99.00 mm (3.898 in)
Maximum Range:	40.00 mm (43.7 yds)
Fuze:	Powder Train Time-delay

Usage: The M30 and M62 are standard, practice, delay-detonating hand grenades. The M30 is the practice version of the M26 and M26A1 grenades; the M62 is the practice version of the M61 grenade.

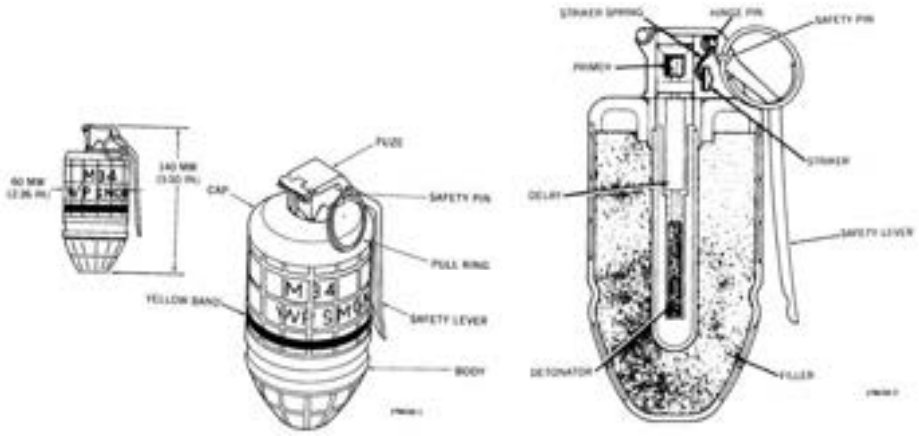
Description: The M30 and M62 grenades are blue, with a brown band around the body or neck. Markings, if any, are stenciled in white.

Filler (Witness Charge) Description: Black powder is a low explosive composed of potassium nitrate or sodium nitrate, charcoal, and sulfur. It is very sensitive to heat, friction, or spark. It was used in safety fuses and practice munitions. It is no longer used as a propellant or bursting charge.

Reference: ORDATA Online

Ordnance Technical Data Sheet

U.S. Grenade, Hand, Smoke, WP, M34



Nomenclature:	U.S. Grenade, Hand, Smoke, WP, M34
Ordnance Family:	Grenades
DODIC:	G937
Filler:	Smoke Mix (White Phosphorus)
Filler weight:	425.25 g (15 oz)
Item weight:	680.00 g (23.99 oz)
Diameter:	60.00 mm (2.362 in)
Length:	140.00 mm (5.512 in)
Maximum Range:	Not Provided
Fuze:	Powder Train Time-delay

Usage: This is a hand-thrown, bursting, smoke-producing grenade. It may also be launched by ground or by airborne grenade launchers.

Description: The grenade is painted light green or gray, with one yellow band around the circumference. Nomenclature is stenciled in light red or yellow. The fuze is olive drab with black markings.

Filler Description: White phosphorus (WP) is a white to light yellow, wax-like, luminous substance (phosphorescent in the dark). On ignition, it produces a yellow-white flame and dense white smoke. When dispersed by ammunition as small particles, it ignites spontaneously on exposure to air and continues to burn on contact with solid materials, even when embedded in human flesh. It is used in bursting-type projectiles, artillery and mortar shells, grenades, rockets, and bombs.

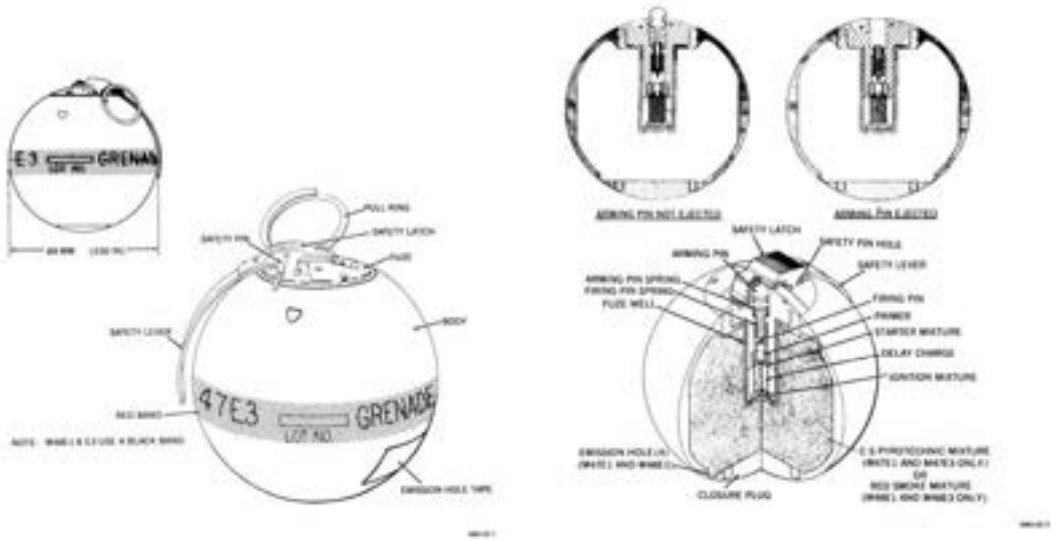
Ordnance Technical Data Sheet

U.S. Grenade, Hand, Red Smoke, M48E1 (Obsolete) and M48E3



Nomenclature:	U.S. Grenade, Hand, Red Smoke, M48E1 and M48E3
Ordnance Family:	Grenades
DODIC:	G932
Filler:	Smoke, Red/Pyrotechnic Mix
Filler weight:	142.00 g (5.009 oz)
Item weight:	390.00 g (13.76 oz)
Diameter:	89.00 mm (3.504 in)
Length:	Not provided
Maximum Range:	Not provided
Fuze:	Powder Train Time-delay

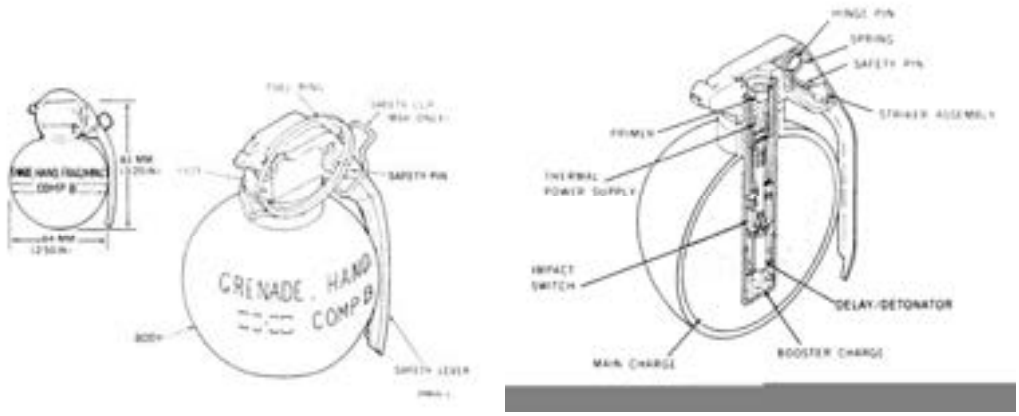
Usage: The M48E1 and M48E3 produce a red-smoke cloud used for training. These are the training grenades for the M47E1 and M47E3.

Description: The M48E1 and M48E3 are painted light green, with a black band and markings stenciled in black.

Reference: ORDATA Online

Ordnance Technical Data Sheet

U.S. Grenade, Hand, Frag, M59 and M68



Nomenclature:	U.S. Grenade, Hand, Frag, M59 and M68
Ordnance Family:	Grenades
DODIC:	G882
Filler:	Composition B
Filler weight:	198.45 g (7 oz)
Item weight:	397.00 g (14 oz)
Diameter:	64.00 mm (2.52 in)
Length:	81.00 mm (3.198 in)
Maximum Range:	Not Provided
Fuze:	Powder Train Time-delay

Usage: These are fragmentation (frag), antipersonnel, impact-activated hand grenades. They use the M217 fuze with a self-destruct delay-detonating feature.

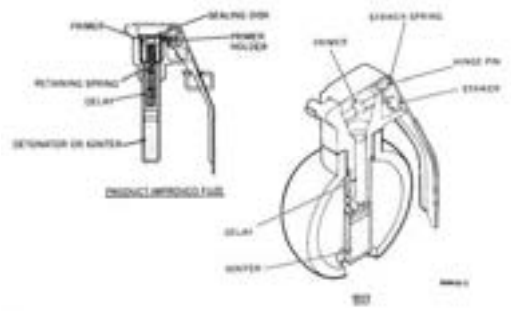
Description: The grenades are olive drab, with markings stenciled in yellow. The fuzes are olive drab with black stenciling.

Filler (Main Charge) Description: Composition B consists of a mixture of TNT (trinitrotoluene) and RDX (cyclotrimethylenetrinitramine, cyclonite, and hexogen). It is used as a burster in Army projectiles, rockets, hand grenades, and landmines.

Reference: ORDATA Online

Ordnance Technical Data Sheet

U.S. Grenades, Hand, Practice, M69



Nomenclature: U.S. Grenades, Hand, Practice, M69
Ordnance Family: Grenades
DODIC: G918
Filler: None
Filler weight: None
Item weight: 397.00 g (13.37 oz)
Diameter: 64.00 mm (2.52 in)
Length: 90.00 mm (3.543 in)
Maximum Range: Not Provided
Fuze: Powder Train Time-delay

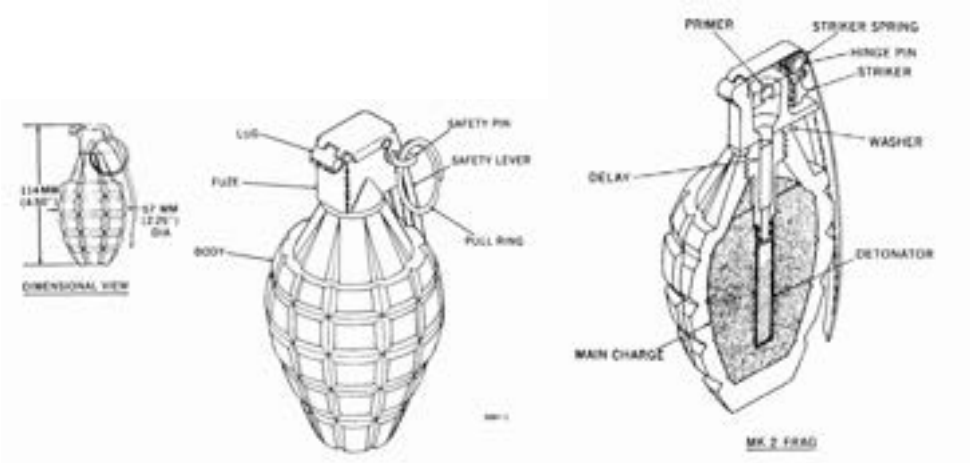
Usage: The M69 is a standard-delay practice version of the M33 and M67 grenades. The M33 and M67 are fragmentation (frag), antipersonnel (apers), delay-detonating hand grenades.

Description: The M69 is blue with a brown band around the body or neck.

Reference: ORDATA Online

Ordnance Technical Data Sheet

MK 2 Grenade, Hand, Antipersonnel



Nomenclature:	MK 2 Grenade, Hand, Antipersonnel
Ordnance Family:	Grenade
DODIC:	G890
Filler:	Flaked TNT
Filler weight:	± 56.70 g (2 oz)
Item weight:	589.68 g (1.3 lbs)
Diameter:	57.00 mm (2.244 in)
Length:	114.00 mm (4.88 in)
Maximum Range:	10.00 m (10.44 yds)
Fuze:	Not Provided

Usage: Fragmentation (frag), antipersonnel, delay-detonating hand grenade.

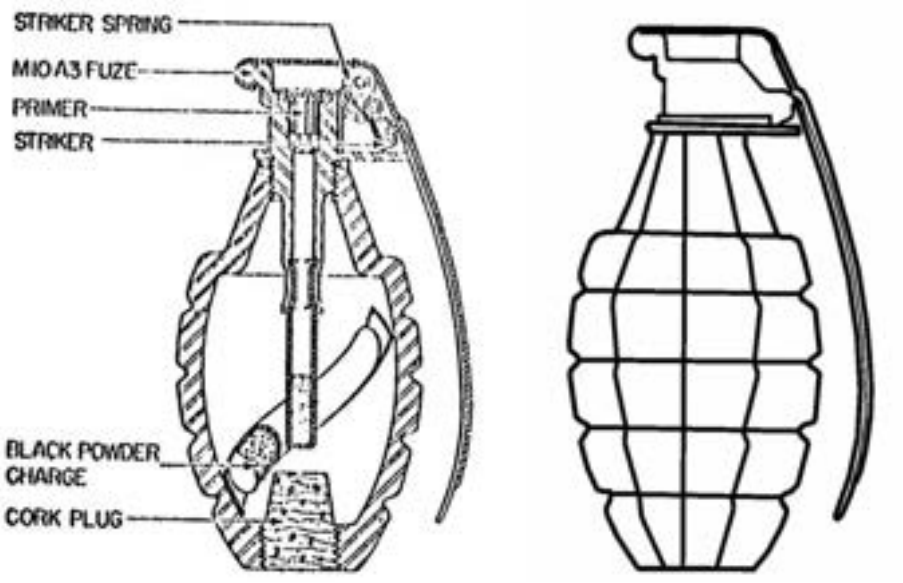
Description: The MK 2 grenade is painted olive drab, with a yellow band around the top of the fuze well. The grenade is referred to as the "Pineapple" because its shape and external serrations resemble a pineapple.

Filler Description: TNT (2, 4, 6-trinitrotoluene), in a pure state, is crystalline and nearly white, resembling a light brown sugar. In a refined form, it is one of the most stable high explosives. It is also used as a constituent of other explosives, including Amatol, Pentolite, Tetrytol, Tritonal, Picratol, and Composition B.

Reference: ORDATA Online, Army Field Manual FM 3-23.30

Ordnance Technical Data Sheet

U.S. Grenade, Practice, MK II (2)



Nomenclature:	U.S. Grenade, Practice, MK II (2)
Ordnance Family:	Grenades
DODIC:	G915
Filler:	Black Powder (Witness Charge Only)
Filler weight:	28.35 g (1 oz)
Item weight:	580.61 g (20.48 oz)
Diameter:	57.17 mm (2.25 in)
Length:	114.30 mm (4.5 in)
Maximum Range:	Not Provided
Fuze:	Powder Train Time-delay

Usage: This grenade consists of a fragmentation body with a filing hole in the base, an Igniting Fuze M206, a small charge of black powder, and a cork plug that is placed in the filling hole. Extra fuzes, charges, and plugs are supplied separately, so that the grenade body can be reused.

Description: The body is light blue.

Filler (Witness Charge) Description: Black powder is a low explosive composed of potassium nitrate or sodium nitrate, charcoal, and sulfur. It is very sensitive to heat, friction, or spark. It was used in safety fuses and practice munitions. It is no longer used as a propellant or bursting charge.

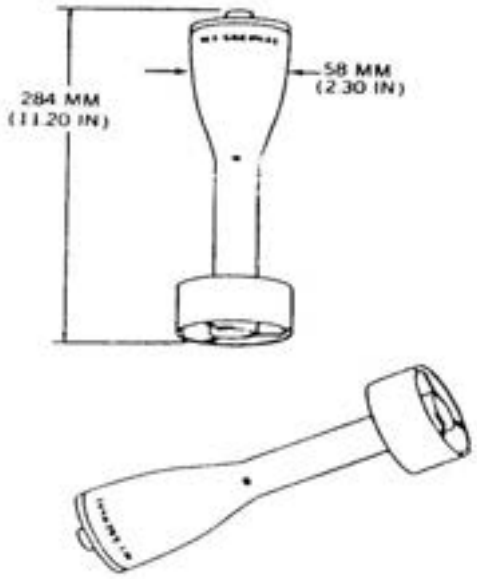
Ordnance Technical Data Sheet

U.S. Grenade, Rifle, M9



Nomenclature:	U.S. Grenade, Rifle, M9
Ordnance Family:	Grenades
DODIC:	Obsolete
Filler:	TNT
Filler weight:	113.40 g (4 oz)
Item weight:	557.00 g (19.68 oz)
Diameter:	58.00 mm (2.283 in)
Length:	284.00 mm (11.18 in)
Maximum Range:	Not Provided
Fuze:	Point-detonating Fuze

Usage: The M9 is an earlier model of the M9A1. It has the same tail assembly, but the head is acorn-shaped and equipped with a point-detonating fuze. The shrouded fin assembly aids in stabilization. It is slightly less sensitive than the M9A1. The safety pin of the M9 is located in the base of the grenade body instead of in the stabilizer tube. The pull ring is secured to the body with adhesive tape.

Description: The grenade is painted olive drab.

Filler (Main Charge) Description: TNT (2, 4, 6-trinitrotoluene), in a pure state, is crystalline and nearly white, resembling a light brown sugar. In a refined form, it is one of the most stable high explosives. It is also used as a constituent of other explosives, including Amatol, Pentolite, Tetrytol, Tritonal, Picratol, and Composition B.

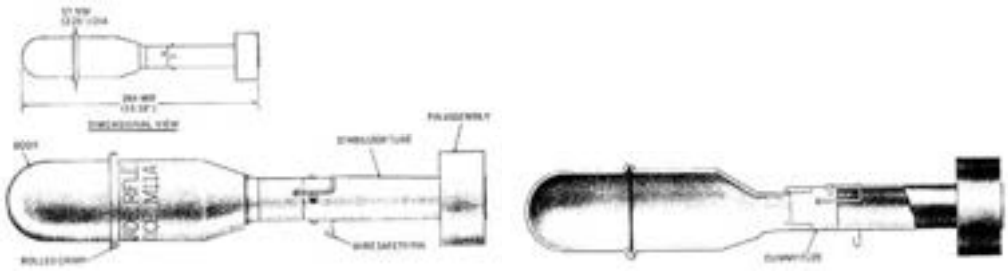
Ordnance Technical Data Sheet

U.S. Grenade, Practice, Inert, M11 Series



Nomenclature: U.S. Grenade, Practice, Inert, M11 Series
Ordnance Family: Grenades
DODIC: G980
Filler: None
Filler weight: None
Item weight: 558.00 g (19.68 oz)
Diameter: 57.00 mm (2.244 in)
Length: 284.00 mm (11.18 in)
Maximum Range: Not Provided
Fuze: N/A

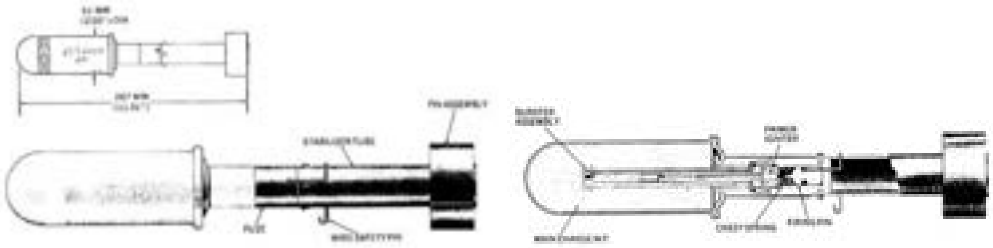
Usage: Rifle-projected grenades, except for the M11 Series, contain a simple impact inertia, base detonating fuze. The M11 Series practice grenade contains a dummy fuze that only has a safety pin hole.

Description: The grenades are painted blue or black, with white markings.

Reference: ORDATA Online

Ordnance Technical Data Sheet

U.S. Grenade, Rifle, Smoke, HC, M20



Nomenclature: U.S. Grenade, Rifle, Smoke, HC, M20
Ordnance Family: Grenades
DODIC: Not Provided (obsolete)
Filler: Smoke Mix, HC
Filler weight: 306.00 g (10.79 oz)
Item weight: 712.00 g (25.12 oz)
Diameter: 51.00 mm (2.008 in)
Length: 287.00 mm (4.3 in)
Maximum Range: Not Provided
Fuze: Impact Inertia, Base Detonating Fuze

Usage: These are rifle-projected grenades that, except for the M11 series, contain a simple impact inertia, base detonating fuze.

Description: The painting and markings for each grenade are either light gray or light green with yellow markings.

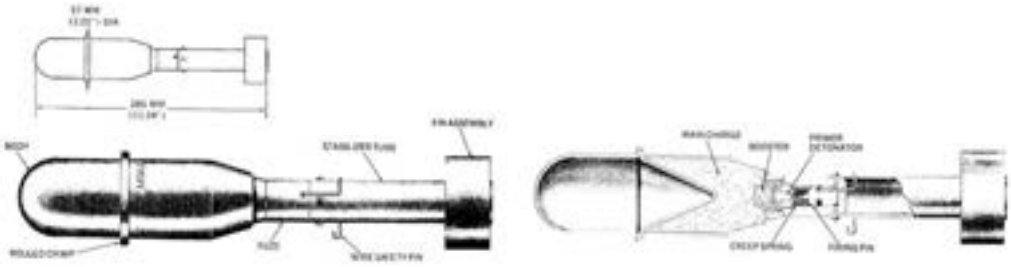
Ordnance Technical Data Sheet

U.S. Grenade, Rifle, HEAT, M9A1 and M9A2



Nomenclature:	U.S. Grenade, Rifle, HEAT, M9A1 and M9A2
Ordnance Family:	Grenades
DODIC:	Not Provided (Obsolete)
Filler:	Pentolite
Filler weight:	113.40 g (4 oz)
Item weight:	558.00 g (1.23 lbs)
Diameter:	57.00 mm (2.244 in)
Length:	285.00 mm (11.22 in)
Maximum Range:	Not Provided
Fuze:	Impact Inertia, Base Detonating Fuze

Usage: These are rifle-projected High Explosive Anti-Tank (HEAT) rifle grenades that contain a simple impact inertia, base detonating fuze.

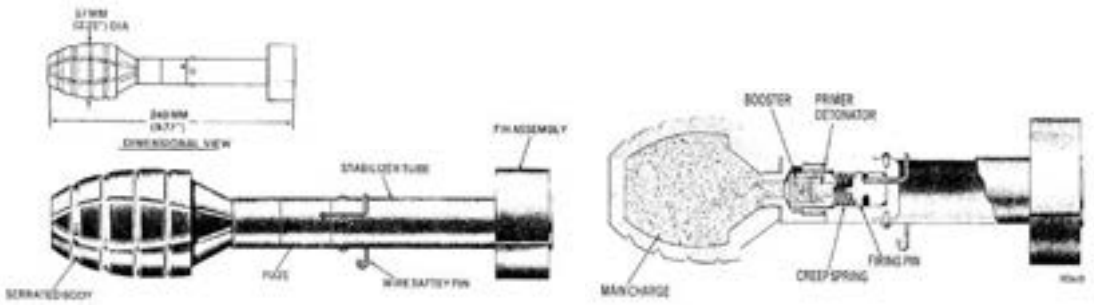
Description: The grenades are olive drab or black with yellow markings.

Filler (Main Charge) Description: Pentolite is composed of explosives, including TNT.

Reference: ORDATA Online

Ordnance Technical Data Sheet

U.S. Grenade, Rifle, Fragmentation, M17



Nomenclature:	U.S. Grenade, Rifle, Fragmentation, M17
Ordnance Family:	Grenades
DODIC:	Obsolete
Filler:	Flaked TNT
Filler weight:	22.00 g (.776 oz)
Item weight:	667.00 g (23.53 oz)
Diameter:	57.00 mm (2.244 in)
Length:	248.00 mm (9.764 in)
Maximum Range:	120 m (131 yds)
Fuze:	Impact Inertia, Base Detonating Fuze

Usage: These are rifle-projected grenades that contain a simple impact inertia, base detonating fuze.

Description: The painting and markings for each grenade are olive drab, with yellow markings.

Filler (Main Charge) Description: TNT (2, 4, 6-trinitrotoluene), in a pure state, is crystalline and nearly white, resembling a light brown sugar. In a refined form, it is one of the most stable high explosives. It is also used as a constituent of other explosives, including Amatol, Pentolite, Tetrytol, Tritonal, Picratol, and Composition B.

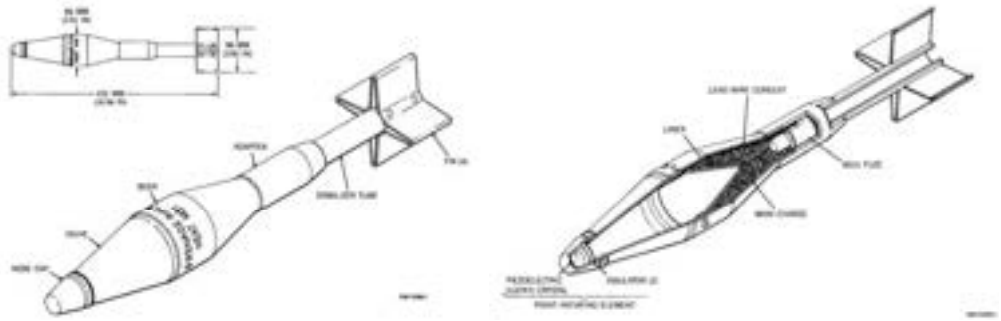
Ordnance Technical Data Sheet

U.S. Grenade, Rifle, HEAT, M31



Nomenclature:	U.S. Grenade, Rifle, HEAT, M31
Ordnance Family:	Grenades
DODIC:	G970
Filler:	Composition B
Filler weight:	280.67 g (9.9 oz)
Item weight:	708.00 g (24.97 oz)
Diameter:	66.00 mm (2.598 in)
Length:	431.00 mm (16.97 in)
Maximum Range:	200 m (218.7 yds)
Fuze:	Point-initiating Base-detonating Fuze, M211

Usage: This is a fin-stabilized high-explosive antitank rifle grenade that has an integral setback-armed, point-initiating base-detonating fuze (M211) that contains a piezoelectric crystal and an electric detonator.

Description: The grenade is painted olive drab and the markings are in yellow. The practice version is painted blue with white markings.

Filler (Main Charge) Description: Composition B consists of a mixture of TNT (trinitrotoluene) and RDX (cyclotrimethylenetrinitramine, cyclonite, and hexogen). It is used as a burster in Army projectiles, rockets, hand grenades, and landmines.

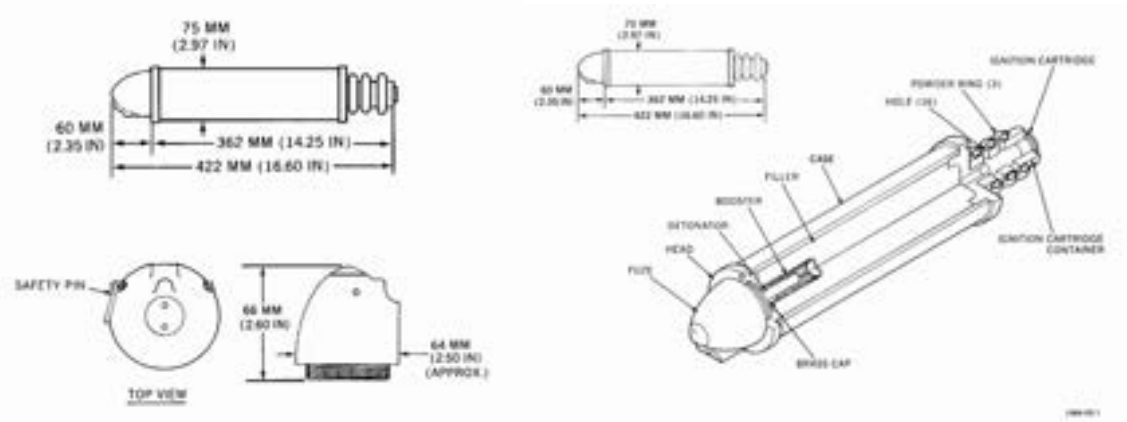
Ordnance Technical Data Sheet

3-Inch Stokes Mortar



Nomenclature:	Mortar, 3-inch Stokes, WP, MK 1 and Practice MK 1
Ordnance Family:	Projectile
DODIC:	Not Provided (obsolete)
Filler:	White Phosphorus (plasticized)
Filler weight:	1.10 kg (2.425 lbs)
Item weight:	5.70 kg (12.57 lbs)
Diameter:	75 mm (2.953 in)
Length:	362 mm (14.25 in)
Maximum Range:	731 m (800 yds)
Fuze:	MK VI Setback-armed, Impact-inertia Fired, All-ways Acting

Usage: The Stokes is a mortar-fired, white phosphorus (WP), or practice cartridge. The WP cartridge is used for screening and against personnel.

Description: The WP case is painted blue-gray with yellow stenciling; the practice case is painted dark blue with white stenciling. The heads of the cases are stamped with the name and mark number of the case, lot number of unfilled cases, inspector's stamp, and initials or symbol of the manufacturer of the metal parts. The cases are stenciled to show the caliber and type, mark number, filler, lot number, and the date and place loaded.

Filler Description: WP is a white to light yellow, wax-like, luminous substance (phosphorescent in the dark). On ignition, it produces a yellow-white flame and dense white smoke. When dispersed by ammunition as small particles, it ignites spontaneously on exposure to air and continues to burn on contact with solid materials, even when embedded in human flesh. It is used in bursting-type projectiles, artillery and mortar shells, grenades, rockets, and bombs.

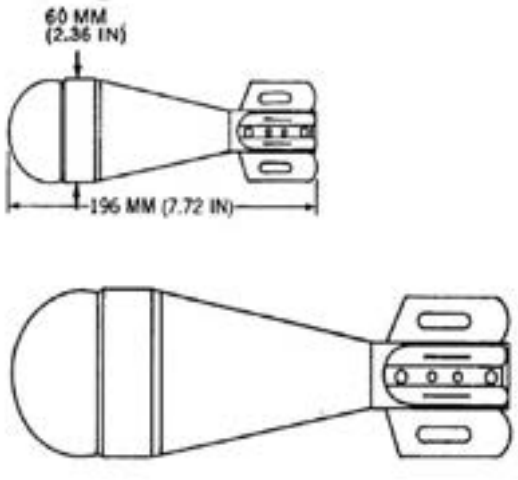
Ordnance Technical Data Sheet

U.S. Projectile, 60MM, Mortar, Drill, M69



Nomenclature: U.S. Projectile, 60MM, Mortar, Drill, M69
Ordnance Family: Projectile
DODIC: Not Provided
Filler: None
Filler weight: None
Item weight: 2.1 kg (4.63 lbs)
Diameter: 60.00 mm (2.36 in)
Length: 196.00 mm (7.27 in)
Maximum Range: 301.00 m (330 yds)
Fuze: None

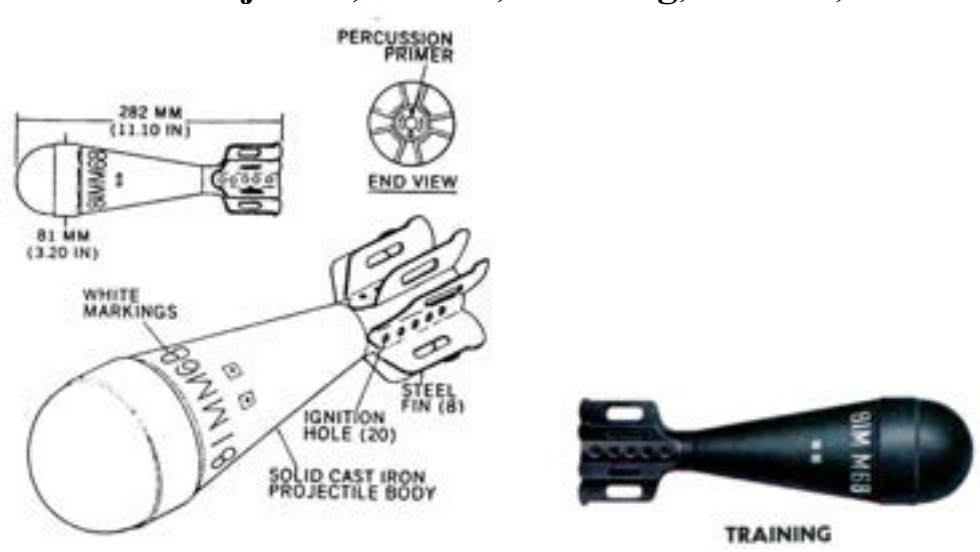
Usage: These projectiles are completely inert and simulate service projectiles for use in training, handling, loading, display, and instruction.

Description: Current projectiles are painted blue, earlier manufactured projectiles are painted black.

Reference: ORDATA Online

Ordnance Technical Data Sheet

U.S. Projectile, 81MM, Training, Mortar, M68



Nomenclature:	U.S. Projectile, 81MM, Training, Mortar, M68
Ordnance Family:	Projectiles
DODIC:	C228
Filler:	None
Filler weight:	None
Item weight:	4.89 kg (10.78 lbs)
Diameter:	81.00 mm (3.189 in)
Length:	282.00 mm (11.1 in)
Maximum Range:	301.00 m (330 yds)
Fuze:	None

Usage: This is an Army, fin-stabilized, mortar-fired projectile used for training on the loading and firing of the mortar weapon system.

Description: Currently manufactured projectiles are painted blue, earlier manufactured projectiles are painted black.

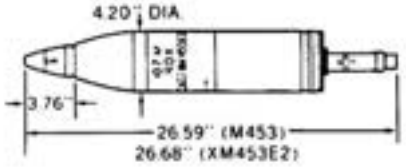
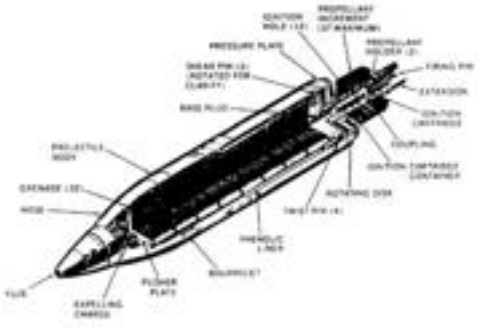
Ordnance Technical Data Sheet

U.S. Cartridge, 4.2-IN (107MM), HE, XM453E2 and M453





Nomenclature: 4.2 Inch (107MM), HE, XM453E2 and M453
Ordnance Family: Projectiles
DODIC: Not Provided
Filler: RDX
Filler weight: 680.40 g (1.5 lbs)
Item weight: 14.06 kg (31 lbs)
Diameter: 107.00 mm (4.2 in)
Length: 675.00 mm (26.57 in)
Maximum Range: Not Provided
Fuze: Mission Dependent

Usage: The general appearance, dimensions, and arrangement of the XM453E2 and M453 4.2-inch (107mm) HE cartridges are shown in the figure above. When the XM453E2 cartridge was type classified, it was designated M453.

Description: The projectile is painted olive drab with markings stenciled in yellow. The identifying features of the cartridges are shown in the figure.

Filler Description: RDX is composed of Cyclotrimethylenetrinitramine, Cyclonite, and Hexogen. It is very stable and is considered the most powerful and brisant of the military high explosives. Although rarely used alone, it is often used in/with other explosives. RDX forms the base for Composition A, B, and C; HBX; H-6; and Cyclotol.

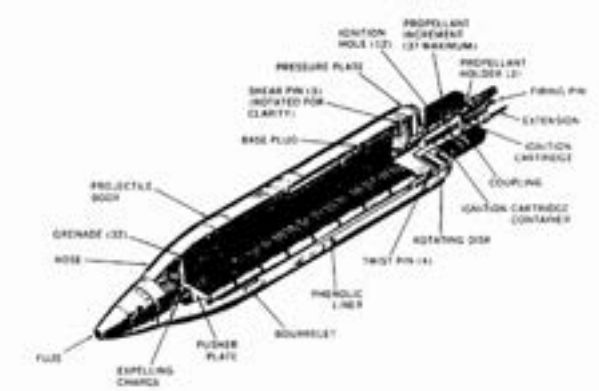
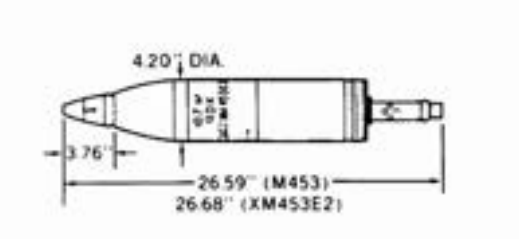
Ordnance Technical Data Sheet

U.S. Cartridge, 4.2-IN (107MM)





Nomenclature:	U.S. Cartridge, 4.2 Inch (107MM)
Ordnance Family:	Projectiles
DODIC:	Not Provided
Filler:	RDX
Filler weight:	680.40 g (1.5 lbs)
Item weight:	14.06 kg (31 lbs)
Diameter:	107.00 mm (4.2 in)
Length:	675.00 mm (26.57 in)
Maximum Range:	3,658 m (4,000 yds)
Fuze:	Mission Dependent

Usage: These are Army, spin-stabilized, mortar-fired, high explosive projectiles.

Description: The complete round consists of a projectile body, fuze, and tail assembly. The projectile body is painted olive drab with yellow markings.

Filler Description: RDX is composed of Cyclotrimethylenetrinitramine, Cyclonite, and Hexogen. It is very stable and is considered the most powerful and brisant of the military high explosives. Although rarely used alone, it is often used in/with other explosives. RDX forms the base for Composition A, B, and C; HBX; H-6; and Cyclotol.

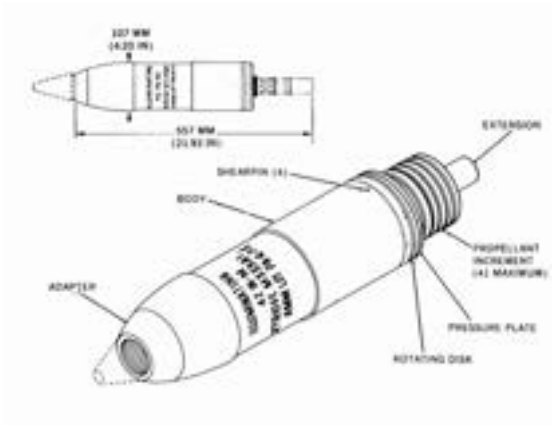
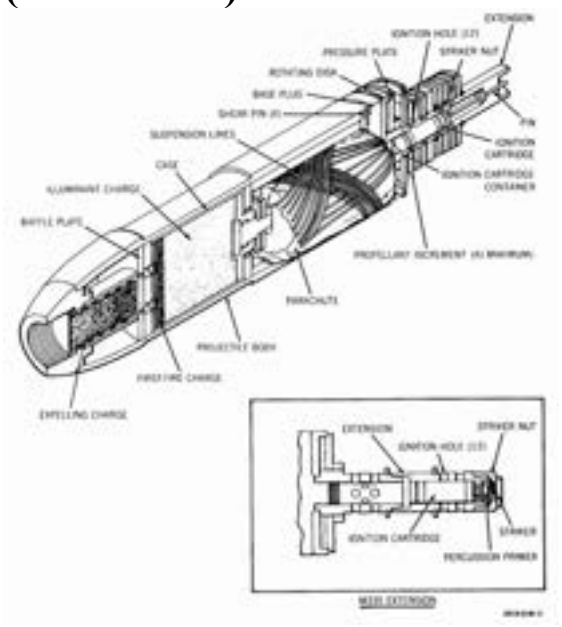
Ordnance Technical Data Sheet

U.S. Cartridge, 4.2-IN (107MM), Illuminating, M335, M335A1, and M335A2 (M335A1E1)





Nomenclature:	Stokes 4.2 inch (107mm) Mortar, Illuminating, M335
Ordnance Family:	Projectile
DODIC:	C706
Filler:	Illuminant Mix
Filler weight:	1.60 kg (3.527 lbs)
Item weight:	11.80 kg (26.01 lbs)
Diameter:	107.00 mm (4.213 in)
Length:	577.00 mm (21.93 in)
Maximum Range:	Not provided
Fuze:	Not provided

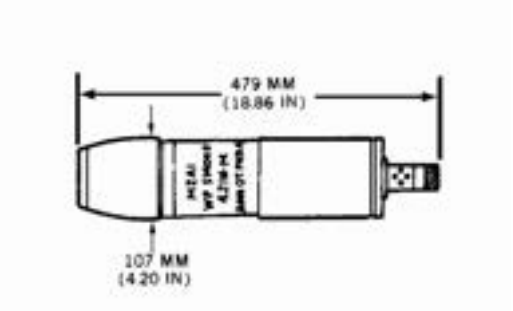
Usage: These are Army, spin-stabilized projectiles containing a base-ejected, parachute suspended illuminant charge. They are fired from mortars when illumination is required.

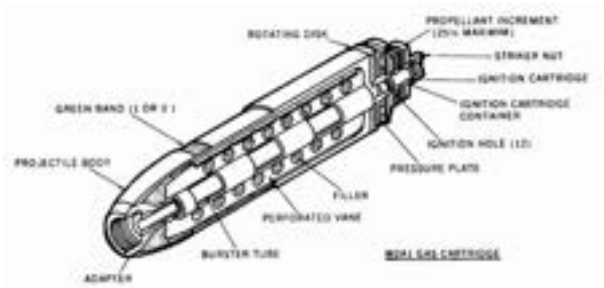
Description: Cartridges have either white projectile bodies with black identification markings or are painted gray with one white band and white identification markings.

Reference: ORDATA Online

Ordnance Technical Data Sheet

U.S. Cartridge, 4.2-Inch (107MM), Smoke, WP, M2, M2A1





Nomenclature: Stokes 4.2-inch Mortar, Smoke (WP)
Ordnance Family: Projectile
DODIC: C708
Filler: Smoke Mix (White Phosphorus)
Filler weight: 3.40 kg (7.496 lbs)
Item weight: 11.30 kg (24.91 lbs)
Diameter: 107.00 mm (4.2 in)
Length: 479.00 mm (18.86 in)
Fuze: Not Provided

Usage: These are Army spin-stabilized projectiles fired from mortars to produce screening or spotting smoke and incendiary effects. The projectiles are filled with white phosphorus (WP), some obsolete M2-series smoke cartridges have a substitute filler of titanium tetrachloride (FM) or sulfur trioxide-chlorsulfonic acid (FS).

Description: Currently manufactured projectiles have light green projectile bodies with one yellow band and light red identification markings. Earlier manufactured projectiles have gray bodies with one yellow band and yellow markings.

Filler Description: WP is a white to light yellow, wax-like, luminous substance (phosphorescent in the dark). On ignition, it produces a yellow-white flame and dense white smoke. When dispersed by ammunition as small particles, it ignites spontaneously on exposure to air and continues to burn on contact with solid materials, even when embedded in human flesh. It is used in bursting-type projectiles, artillery and mortar shells, grenades, rockets, and bombs.

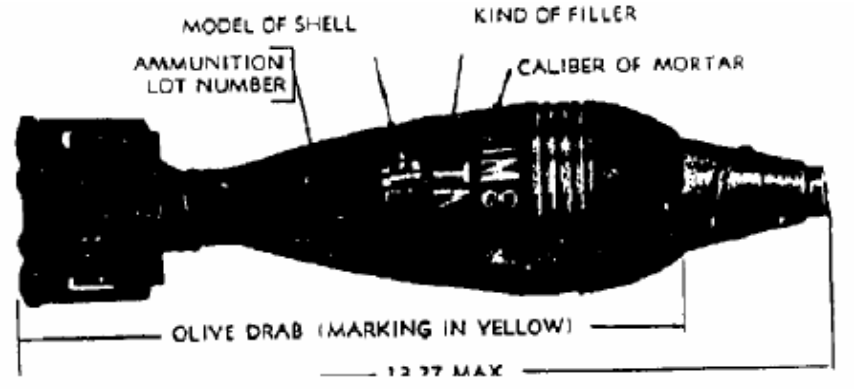
Ordnance Technical Data Sheet

U.S. Projectile, 81MM, HE, M43A1



Nomenclature:	81MM, HE, Mortar
Ordnance Family:	Projectile
DODIC:	C225
Filler:	TNT
Filler weight:	553.39 kg (1.22 lbs)
Item weight:	3.20 kg (7.055 lbs)
Diameter:	81 mm (3.189 in)
Length:	337.06 mm (13.27 in)
Maximum Range:	2,400 m (2,625 yards)
Fragmentation Distance:	612.3 m (2,009 ft)
Fuze:	Various

Usage: The shell was originally adapted as the light shell for the 81mm mortar. It is designed for use against light targets, such as machine gun nests, barbed wire entanglements, and personnel in the open.

Description: The body is olive drab with yellow markings. The body, filler, adapter, and bakelite fuze well cup are exactly the same as in the M43. The fuze used is the Point-detonating Fuze M52, which has a super quick action. Due to the light weight and blunt nose of this shell, very little penetration can be obtained. This shell is designed to produce fragments as its primary function against personnel in the open and against barbed wire entanglements. Fragments to be effective must be above ground. A super quick fuze is used to burst the shell above ground. The body of the shell is constructed of forged steel.

Filler Description: TNT (2, 4, 6-trinitrotoluene), in a pure state, is crystalline and nearly white, resembling a light brown sugar. In a refined form, it is one of the most stable high explosives. It is also used as a constituent of other explosives, including Amatol, Pentolite, Tetrytol, Tritonal, Picratol, and Composition B.

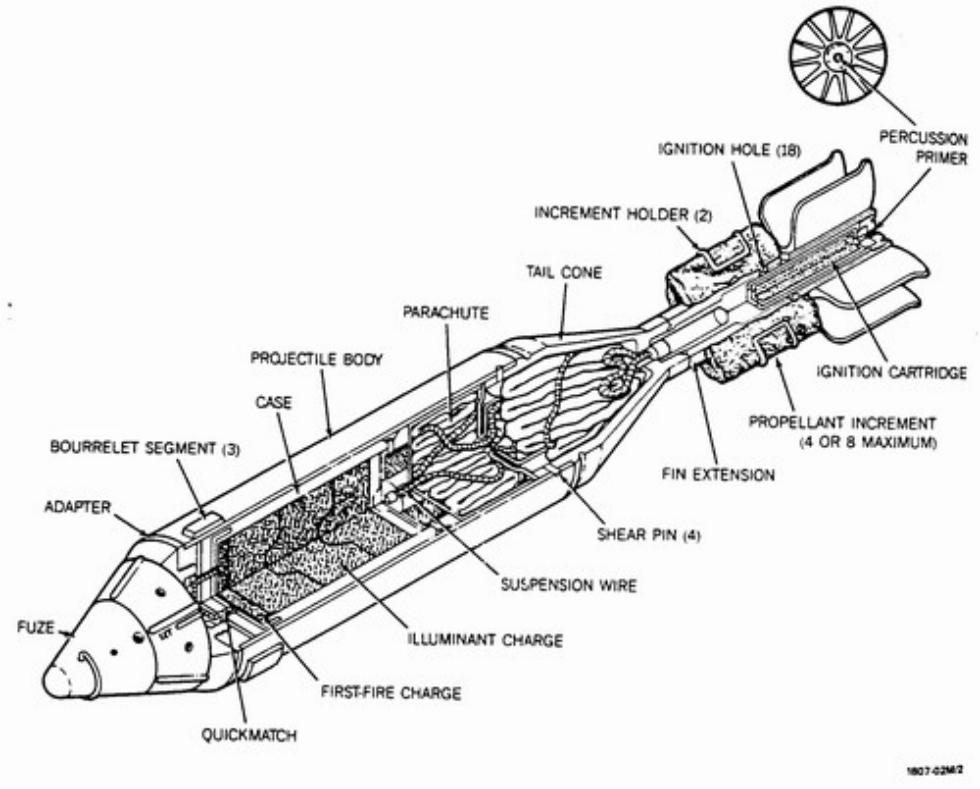
Ordnance Technical Data Sheet

81MM Mortar



Nomenclature:	81MM (3.18in) Mortar
Ordnance Family:	Projectile
DODIC:	C225
Filler:	Round Dependent (Illuminant Charge)
Filler weight:	± 645.00 g
Item weight:	3.4 kg (7.5 lbs)
Diameter:	81 mm (3.189 in)
Length:	571.00 mm (23.20 in)
Maximum Range:	2,400 m (2,625 yds)
Fuze:	M935 Point Detonating Fuze or M734/734A1 Multi-Option Fuze

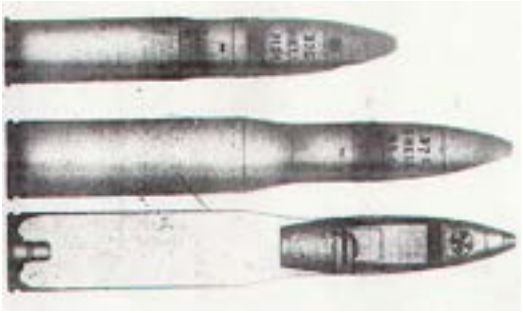
Usage: A Light Support Weapon that provides capability for high explosive, screening smoke, and illumination rounds delivered out to a maximum range of 2,400 m.

Description: The projectiles are painted white with stenciled black identification markings on the projectile bodies. Projectiles also may be gray with a white band and white markings.

Reference: ORDATA Online

Ordnance Technical Data Sheet

U.S. Projectile, 37MM, Gun, HE, M54A1



Nomenclature:	37MM Projectile, High Explosive
Ordnance Family:	Projectile
Filler:	Tetryl
Filler weight:	45.36 g (1.6 oz)
Item weight:	1.188 kg (2.62 lbs)
Diameter:	37.00 mm (1.457 in)
Length:	325.4 mm (12.81 in)
Maximum Range:	11,750 m (12,850 yds)
Fuze:	M56 Fuze

Usage: This general purpose projectile is used for blast and fragmentation effect against personnel, unarmored material targets, and aircraft. It has a substantial high explosive (HE) main charge. The projectile has a relatively thin to medium body-wall thickness. The fragmentation effect results from fracture of the body wall on detonation of the main charge.

Description: The projectile may be fitted with a variety of fuzes for effective use in engaging different types of targets. The presence of the M56 Fuze identifies the round as an HE M54. The complete M54 round (HE shell) can be identified for the M1A2 Antiaircraft Gun by the extracting groove in the cartridge case.

Filler Description: Tetryl is composed of 2,4,6-Trinitrophenylmethylnitramine, N-methyl-N, 2,4,6-Tetranitroaniline, Tetralite, Tetrylite, and Pyronite. It is used extensively as a booster and main charge for small caliber projectiles. It is also used as the base charge in compound detonators. Tetryl is a finely divided crystalline powder that is colorless when freshly prepared and highly purified, rapidly acquires a yellow color when exposed to light, and turns gray when graphite is added as a lubricant during loading. Sensitivity is intermediate between TNT and PETN; it is more sensitive than Picric acid and can be detonated easier than TNT or Ammonium picrate. Tetryl is considered as sensitive as Mercury fulminate when finely divided and it will usually detonate when subjected to bullet impact. Tetryl is slightly hygroscopic, but not adversely affected by moisture.

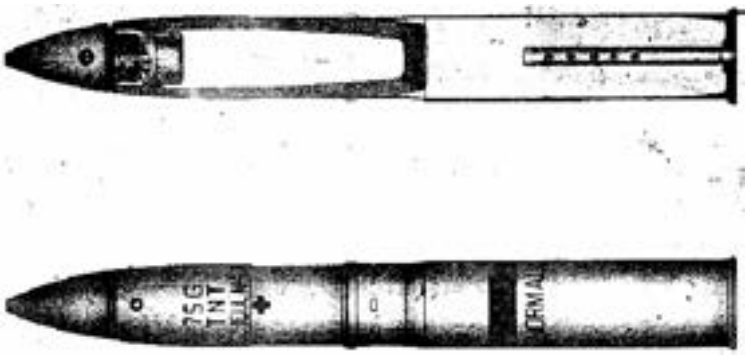
Ordnance Technical Data Sheet

U.S. Projectile, 75MM, Gun, HE, M48



Nomenclature:	75MM Projectile, High Explosive		
Ordnance Family:	Projectile		
Filler:	TNT or Amatol		
Filler weight:	675.9 g (23.84 oz)		
Item weight:	8.274 kg (18.24 lbs)		
Diameter:	75.00 mm (2.953 in)		
Length:	596.4 mm (23.48 in)		
Maximum Range:	7,224 m (7,900 yds)		
Fragmentation Distance:	612.3 m (2,009 ft)	**Fuze:**	Varies

Usage: This is an Army gun-fired projectile that is nose fuzed only. It is painted green.

Description: Army HE projectiles are issued either with a nose fuze in place or with a removable lifting plug or closing plug that is replaced with a nose fuze before firing. Fuze types include ET, MT, MTSQ, PD, and PDSD. These projectiles do not have base fuzes.

Filler (Main Charge) Description: TNT (2, 4, 6-trinitrotoluene), in a pure state, is crystalline and nearly white, resembling a light brown sugar. In a refined form, it is one of the most stable high explosives. It is also used as a constituent of other explosives, including Amatol, Pentolite, Tetrytol, Tritonal, Picratol, and Composition B. Amatol is a main charge explosive employed by practically all foreign countries. It is used in the U.S. as a substitute explosive in 3-inch, 155mm, and larger shells. It is a mixture of Ammonium nitrate and TNT, with the percentage by weight of ammonium nitrate varying from 40 to 80 percent. It has a color of yellow to dark brown depending on the composition and purity of components. Amatol is less sensitive to detonation than TNT, but is readily detonated by mercury fulminate and other high explosives. It is very hygroscopic and, therefore, is usually protected by a sealing pour of TNT.

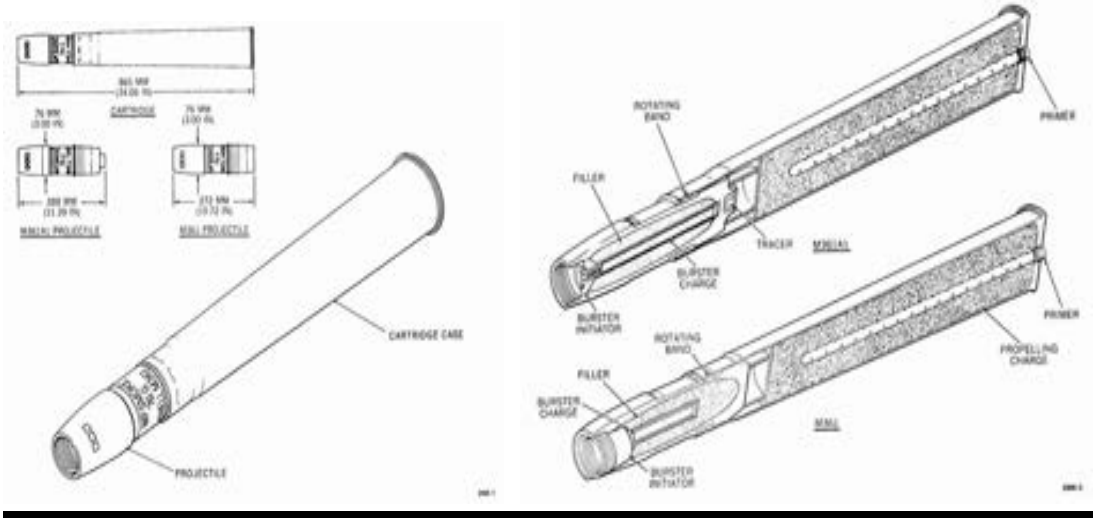
Ordnance Technical Data Sheet

U.S. Cartridge, 76MM, Smoke, WP, M361 (T140E2) and M361A1



Nomenclature:	76MM, Smoke (WP), M361
Ordnance Family:	Projectile
DODIC:	C128
Filler:	Smoke Mix (White Phosphorus)
Filler weight:	612.00 g (1.349 lbs)
Item weight:	6.00 kg (13.23 lbs)
Diameter:	76.00 mm (2.992 in)
Length:	272.00 mm (10.71 in)
Maximum Range:	Not Provided
Fuze:	Impact Fired

Usage: These are Army smoke projectiles used for spotting targets or screening; the projectiles also have a slight incendiary effect.

Description: Older projectiles are gray with a yellow band and yellow markings; newer projectiles are light green with a yellow band and red markings.

Filler Description: White phosphorus (WP) is a white to light yellow, wax-like, luminous substance (phosphorescent in the dark). On ignition, it produces a yellow-white flame and dense white smoke. When dispersed by ammunition as small particles, it ignites spontaneously on exposure to air and continues to burn on contact with solid materials, even when embedded in human flesh. It is used in bursting-type projectiles, artillery and mortar shells, grenades, rockets, and bombs.

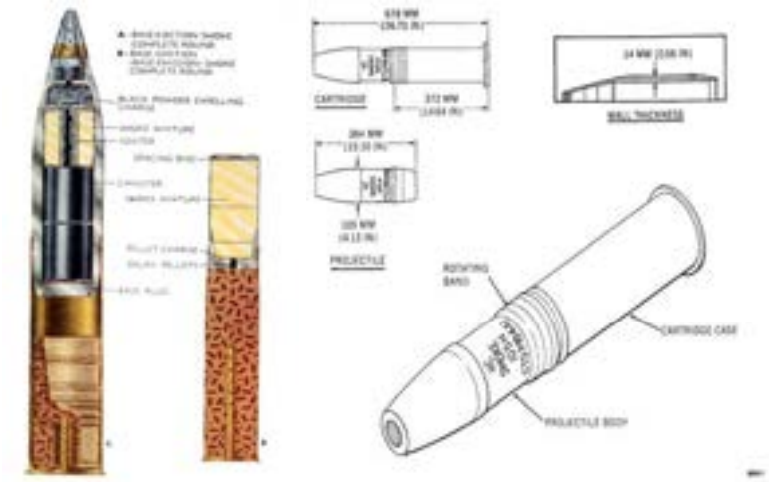
Ordnance Technical Data Sheet

U.S. Cartridge, 105MM, HC and Colored Smoke, BE, M84 and M84A1



Nomenclature:	105MM, HC and Colored Smoke, BE, M84 and M84A1
Ordnance Family:	Projectile
DODIC:	C452
Filler:	Smoke Mix
Filler weight:	5.90 kg (13.01 lbs)
Item weight:	19.00 kg (41.89 lbs)
Diameter:	105.00 mm (4.123 in)
Length:	384.00 mm (15.12 in)
Maximum Range:	2,003 m (2,190 yds)
Fuze:	Mechanical Time Fuze

Usage: These are percussion-primed, semi-fixed Howitzer-fired cartridges with spin-stabilized, base-ejection smoke projectiles. They contain smoke canisters that emit either white, red, yellow, green, or violet smoke upon ejection. They are used for screening, spotting, or signaling purposes. The figure shows the appearance and dimensions of the M84A1 cartridge. The M84 and M84B1 cartridges are similar.

Description: Earlier manufactured projectiles are painted gray, with one yellow band and yellow-stenciled identification and manufacturing markings. Newer projectiles are painted light green, with black-stenciled identification and manufacturing markings. Older projectiles are marked with a row of squares whose color corresponds to the color of the smoke produced. Newer projectiles have either the letters HC, indicating that white smoke is produced, or a row of three letter C's in the color of the smoke produced. Brass cartridge cases are not painted. Steel cartridge cases are lacquered dark green or dark brown. White-stenciled identification and manufacturing markings are found on the base and on the lower portion of the cartridge case.

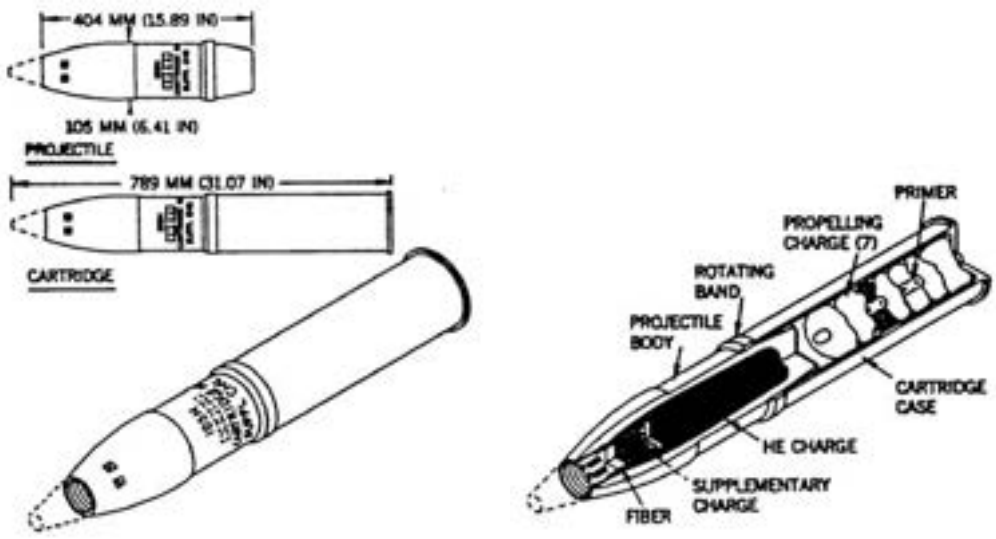
Ordnance Technical Data Sheet

U.S. Projectile, 105MM, HE, M1



Nomenclature:	U.S. Projectile, 105MM, HE, M1
Ordnance Family:	Projectiles
DODIC:	C430
Filler:	Composition B
Filler weight:	2.30 kg (5.071 lbs)
Item weight:	18.11 kg (39.9 lbs)
Diameter:	105.00 mm (4.134 in)
Length:	404.00 mm (15.91 in)
Maximum Range:	7,585 m (8,295 yds)
Fuze:	Not Provided

Usage: This is an Army, spin-stabilized, Howitzer-fired, high explosive projectile.

Description: The projectile is olive drab with yellow markings.

Filler (HE Charge) Description: Composition B consists of a mixture of TNT (Trinitrotoluene) and RDX (Cyclotrimethylenetrinitramine, Cyclonite, and Hexogen). It is used as a burster in Army projectiles, rockets, hand grenades, and landmines.

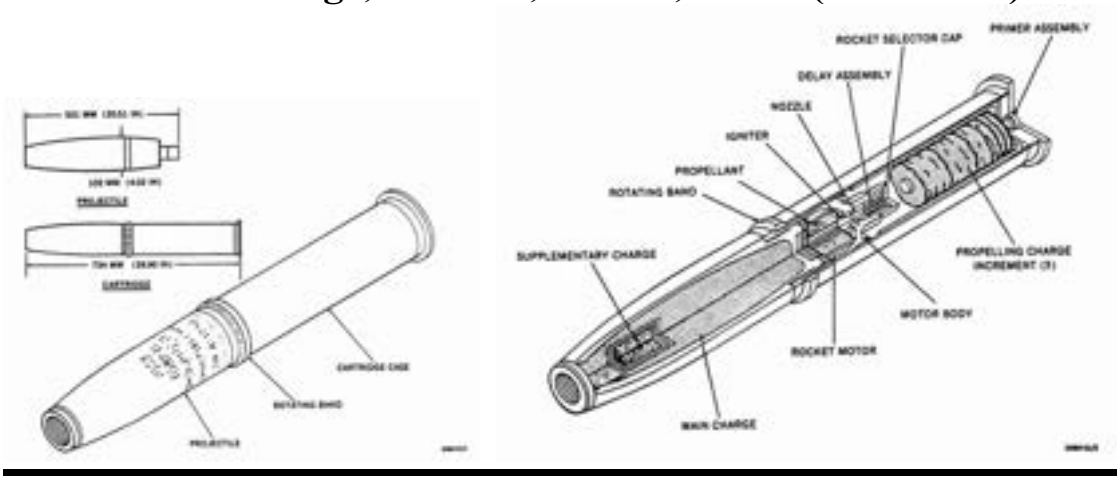
Ordnance Technical Data Sheet

U.S. Cartridge, 105MM, HERA, M548 (XM548E1)



Nomenclature: 105MM, HERA, M548 (XM548E1)
Ordnance Family: Projectile
DODIC: C468
Filler: Composition B
Filler weight: 3.00 kg (6.614 lbs)
Item weight: 13.00 kg (28.66 lbs)
Diameter: 102.00 mm (4.16 in)
Length: 521.00 mm (20.51 in)
Maximum Range: 7,585 m (8,295 yds)
Fuze: Not Provided

Usage: This is a spin-stabilized, high-explosive rocket-assisted (HERA) semi-fixed cartridge with an extended-range capability. It is used against personnel and material.

Description: The projectile is painted olive drab with markings stenciled in yellow. The cartridge case is unpainted with yellow markings.

Filler (Main Charge) Description: Composition B consists of a mixture of TNT (Trinitrotoluene) and RDX (Cyclotrimethylenetrinitramine, Cyclonite, and Hexogen). It is used as a burster in Army projectiles, rockets, hand grenades, and landmines.

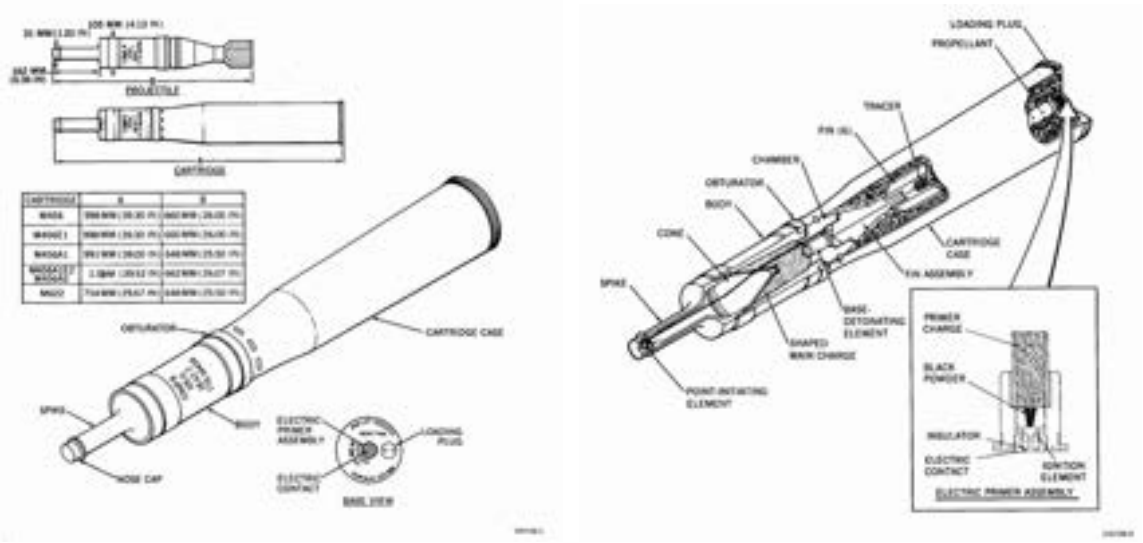
Ordnance Technical Data Sheet

U.S. Cartridge, 105MM, HEAT-T, M622 and M456A1



Nomenclature: 105MM, HEAT-T, M622 and M456A1
Ordnance Family: Projectile
DODIC: C508
Filler: Composition B
Filler weight: 1.00 kg (2.205)
Item weight: 10.00 kg (22.50)
Diameter: 105.00 mm (4.134 in)
Length: 648.00 mm (25.51 in)
Maximum Range: Not Provided
Fuze: M509 Series Impact Fuze

Usage: This is a fixed cartridge with a fin-stabilized high-explosive antitank with tracer (HEAT-T) projectile. The projectile incorporates a setback-armed, point-initiating base-detonating (PIBD) fuze containing a piezoelectric (Lucky) crystal and an electric detonator. The M509-series fuzes are impact fired.

Description: The projectiles are painted black or olive drab. The M622 markings are white. The M456A1 markings are yellow and white, with yellow bands on the spike.

Filler (Main Charge) Description: Composition B consists of a mixture of TNT (Trinitrotoluene) and RDX (Cyclotrimethylenetrinitramine, Cyclonite, and Hexogen). It is used as a burster in Army projectiles, rockets, hand grenades, and landmines.

Ordnance Technical Data Sheet

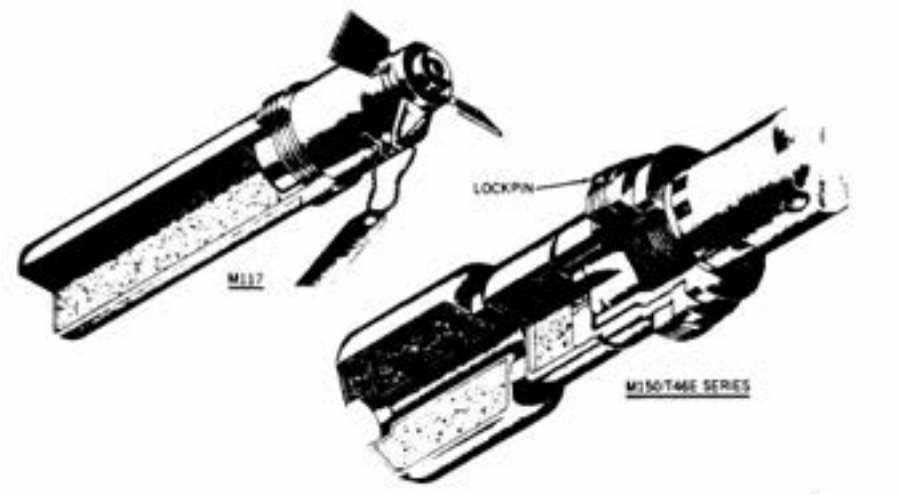
Adapter Booster



Nomenclature: Adapter Booster
Ordnance Family: Misc.
DODIC: Not Provided
Filler: Tetryl
Filler weight: 196 g (6.9 oz)
Item weight: Not Available
Diameter: Varies
Length: 173 mm (6.8 in)

Usage: The adapter booster is a device fitted into the fuze well of a bomb that allows a fuze of smaller diameter to be used. Adapter boosters contain an explosive that transmits the firing train output of the fuze to the main explosive charge of the bomb. These devices can be used in projectiles, bombs, and rocket warheads.

Filler Description: Tetryl is composed of 2,4,6-Trinitrophenylmethylnitramine, N-methyl-N, 2,4,6-Tetranitroaniline, Tetralite, Tetrylite, and Pyronite. It is used extensively as a booster and main charge for small caliber projectiles. It is also used as the base charge in compound detonators. Tetryl is a finely divided crystalline powder that is colorless when freshly prepared and highly purified, rapidly acquires a yellow color when exposed to light, and turns gray when graphite is added as a lubricant during loading. Sensitivity is intermediate between TNT and PETN; it is more sensitive than Picric acid and can be detonated easier than TNT or Ammonium picrate. Tetryl is considered as sensitive as Mercury fulminate when finely divided and it will usually detonate when subjected to bullet impact. Tetryl is slightly hygroscopic, but not adversely affected by moisture.

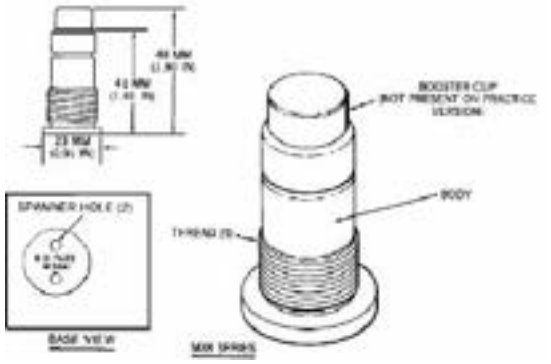
U.S. Fuze, Projectile, BD, M38 and M38A1



Nomenclature:	Projectile Fuze
Ordnance Family:	Fuze
DODIC:	Not Provided
Filler:	Tetryl
Filler weight:	Less than 2 grams
Item weight:	Not Available
Diameter:	23 mm (0.91 in)
Length:	48 mm (1.90 in)
Fuze:	Various

Usage: These are setback-armed, impact-inertia-fired, non-delay, base-detonating fuzes. The fuzes are not painted and are marked on their bases with their nomenclatures. The bodies of the M38 series fuzes are brass.

Description: On projectile firing, the setback drives the setback sleeve rearward, which forces the resistance ring rearward over the shoulder and into the groove around the base of the firing pin. The resistance ring locks the setback sleeve and firing pin together, with the tip of the firing pin protruding from the front of the sleeve. On projectile impact, inertia drives the firing pin and sleeve forward against the creep spring. The firing pin stabs the detonator, initiating the explosive train.

Filler Description: Tetryl is composed of 2,4,6-Trinitrophenylmethylnitramine, N-methyl-N, 2,4,6-Tetranitroaniline, Tetralite, Tetrylite, and Pyronite. It is used extensively as a booster and main charge for small caliber projectiles. It is also used as the base charge in compound detonators. Tetryl is a finely divided crystalline powder that is colorless when freshly prepared and highly purified, rapidly acquires a yellow color when exposed to light, and turns gray when graphite is added as a lubricant during loading. Sensitivity is intermediate between TNT and PETN; it is more sensitive than Picric acid and can be detonated easier than TNT or Ammonium picrate. Tetryl is considered as sensitive as Mercury fulminate when finely divided and it will usually detonate when subjected to bullet impact. Tetryl is slightly hygroscopic, but not adversely affected by moisture.

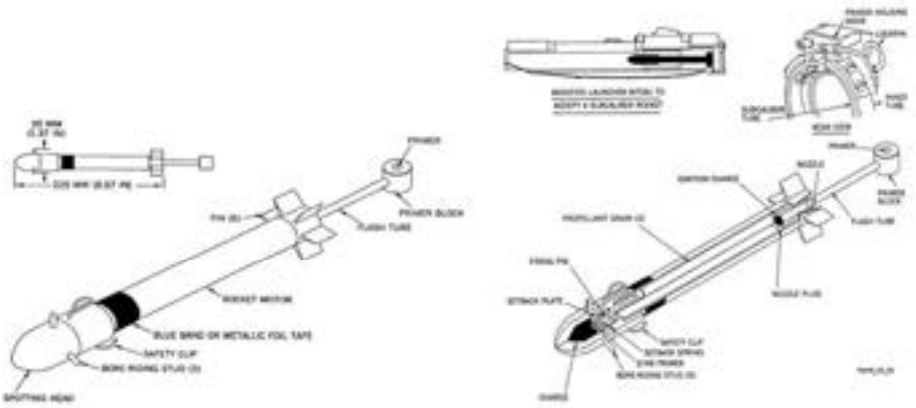
Ordnance Technical Data Sheet

U.S. Rocket, 35MM, Sub-caliber, Practice, M73



Nomenclature: U.S. Rocket, 35MM, Sub-caliber, Practice, M73
Ordnance Family: Rocket
DODIC: H708
Filler: Smoke Mix (Witness Charge Only)
Filler weight: 10.00 g (.3527 oz)
Item weight: 145.00 g (5.115 oz)
Diameter: 35.00 mm (1.3878 in)
Length: 225.00 mm (8.858 in)
Maximum Range: 220 m (240.6 yds)
Fuze: Impact-inertia Fuze

Usage: This is a sub-caliber practice rocket incorporating an integral, impact-inertia fuze. It is used for training and simulates the rocket for the light antitank weapon (LAW) system. The rocket is fired from a practice M190 launcher (a modified M72A1 LAW launcher). The figure shows the appearance and dimensions of the M73 practice rocket and M190 launcher.

Description: The spotting head and fins are painted black; the remainder of the rocket is olive drab. A blue band appears on the forward end of the rocket motor. On later production rockets, the spotting head is painted blue and the fins are painted brown. The rocket motor section is olive drab with white markings. A metallic foil covered tape is attached around the forward end of the rocket motor for weight adjustment.

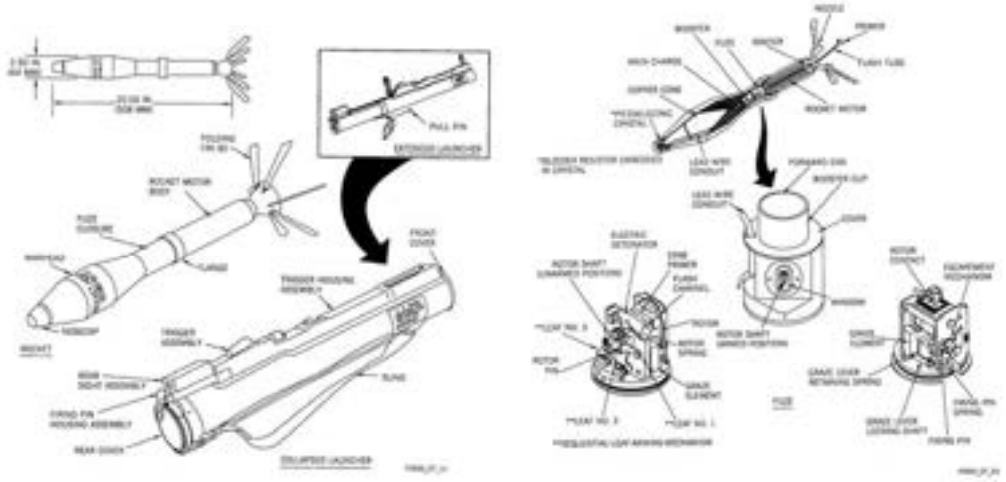
Ordnance Technical Data Sheet

U.S. Rocket, 66MM, Law, M72, M72A1, M72A2, and M72A3



Nomenclature:	66MM, Law, M72, M72A1, M72A2, and M72A3
Ordnance Family:	Rockets
DODIC:	B642
Filler:	Octol
Filler weight:	454.00 g (16.01 oz)
Item weight:	2.18 kg (4.806 lbs)
Diameter:	64.00 mm (2.52 in)
Length:	508.00 mm (20 in)
Maximum Range:	1,000 meters (3,300 feet)
Fuze:	M412 PIBD or M412A1

Usage: These are shoulder-fired, fin-stabilized, high-explosive light antitank weapons used primarily to penetrate armored targets. The rockets use an M54 rocket motor. The M72 uses an M18 warhead and an M412 point-initiating base-detonating (PIBD) fuze.

Description: The rocket launcher is painted olive drab with instruction labels on olive drab backgrounds with white printing. The manufacturing information is also printed in white. Launchers with limited light sights have a decal stating such and front sights coated with a yellow- or white-colored radioactive material at the 100- and 150-meter range markings and the remaining markings in red. Front sights not coated for night use will have all range markings in red. The rocket motor is brown and the warhead is black with yellow markings.

Filler (Main Charge) Description: Octol is a mixture of HMX (75%) and TNT (25%). HMX is a high melting explosive composed of Octogen and Cyclotetramethylene-tetranitramine. It is sensitive to high temperatures and is typically mixed with TNT in high blast explosives. TNT (2, 4, 6-trinitrotoluene), in a pure state, is crystalline and nearly white, resembling a light brown sugar. It is one of the most stable high explosives in refined form.

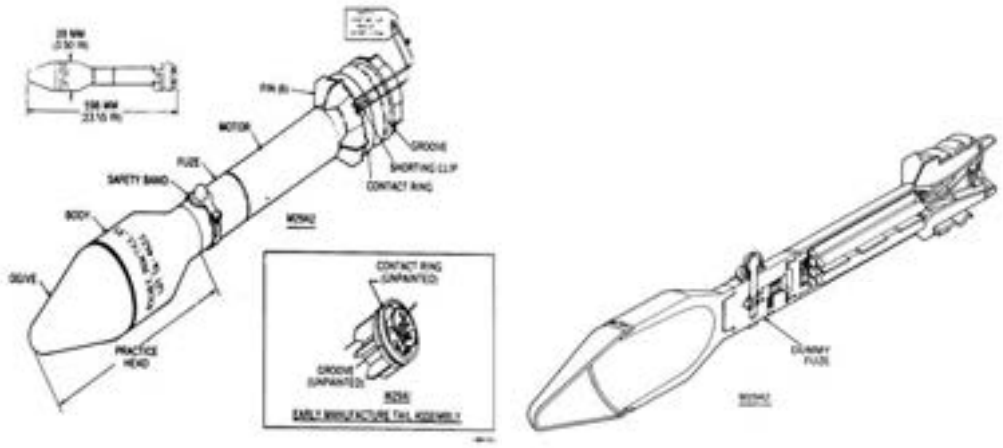
Ordnance Technical Data Sheet

U.S. Rocket, 3.5-Inch, Practice, M29, M29A1, and M29A2



Nomenclature:	3.5-Inch, Practice, M29, M29A1, and M29A2
Ordnance Family:	Rockets
DODIC:	H601
Filler:	None
Filler weight:	None
Item weight:	3.90 kg (137.6 oz)
Diameter:	89.00 mm (3.5 in)
Length:	598.00 mm (23.54 in)
Fuze:	None

Usage: The M29-series rockets are inert and are used for training. The M29A2 rocket is modified for use in the M69 practice landmine system.

Description: The fuzes are painted olive drab or black and have the designation and loading information stamped on the body. The M29 warhead and rocket motor are blue. The M29A1 and M29A2 warheads are blue and the rocket motors are brown or olive drab with brown bands. The M29-series practice heads have white markings. The contact ring and groove, or notch, on the rockets are not painted.

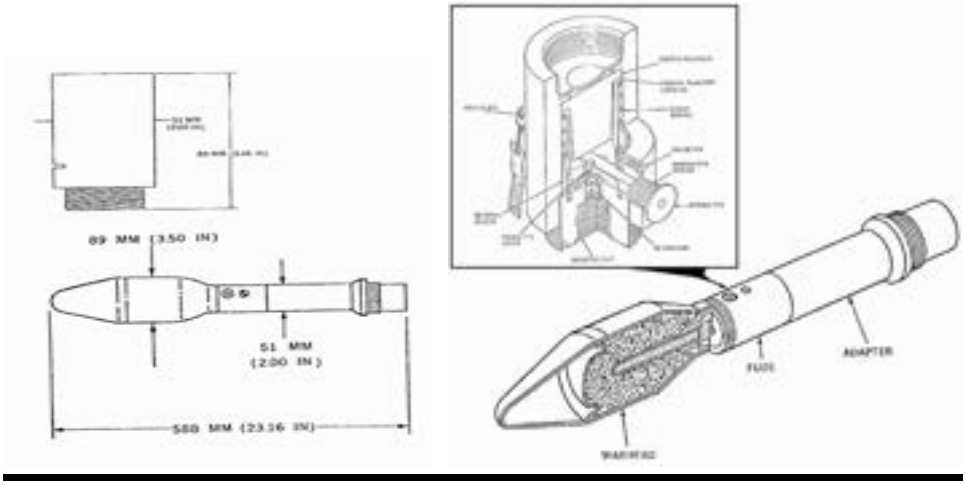
Ordnance Technical Data Sheet

U.S. Rocket Warhead, 3.5-Inch



Nomenclature: U.S. Rocket Warhead, 3.5-Inch Smoke, WP, Aircraft
Ordnance Family: Rockets
DODIC: Obsolete
Filler: Smoke Mix (White Phosphorus)
Filler weight: 1.00 kg (2.2 lbs)
Item weight: 4.90 kg (10.8 lbs)
Diameter: 89.00 mm (3.5 in)
Length: 588.00 mm (23.15 in)
Maximum Range: Not Provided
Fuze: M404A1 Base Detonating (BD)

Usage: This is a 3.5-inch white phosphorus (WP) filled rocket warhead. It uses the M404A1 (modified) fuze, which is a direct-arming, base-detonating (BD), non-delay fuze. The warhead and fuze are coupled to a 2.75-inch rocket motor by an adapter and are used against aircraft.

Description: The fuze is painted olive drab or black and has the designation and loading information stamped on the body. Older warheads are painted gray with yellow markings.

Filler Description: WP is a white to light yellow, wax-like, luminous substance (phosphorescent in the dark). On ignition, it produces a yellow-white flame and dense white smoke. When dispersed by ammunition as small particles, it ignites spontaneously on exposure to air and continues to burn on contact with solid materials, even when embedded in human flesh. It is used in bursting-type projectiles, artillery and mortar shells, grenades, rockets, and bombs.

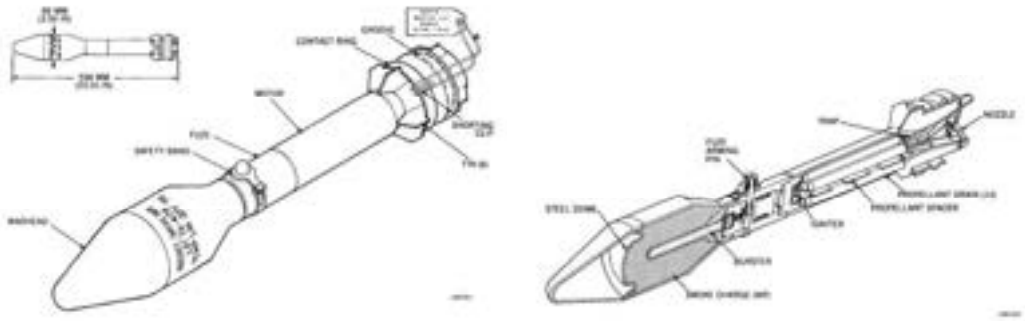
Ordnance Technical Data Sheet

U.S. Rocket, 3.5-Inch, Smoke (WP), M30 (T127E3) and T127E2



Nomenclature: 3.5-Inch, Smoke (WP), M30 (T127E3) and T127E2
Ordnance Family: Rockets
DODIC: Not Provided
Filler: Smoke Mix (White Phosphorus)
Filler weight: 1.10 kg (2.425 lbs)
Item weight: 4.10 kg (9.039 lbs)
Diameter: 98.00 mm (3.5 in)
Length: 589.00 mm (23.54 in)
Maximum Range: Not Provided
Fuze: Impact, Base Detonating Fuze

Usage: These are 3.5-inch, ground-fired, fixed-fin, smoke (white phosphorus) rockets.

Description: The warheads are light green with light red markings and a light red band. Older warheads are painted gray with yellow markings. The rocket motor is brown or olive drab. The fuzes are painted olive drab or black and have the designation and loading information stamped on the body.

Filler (Smoke Charge) Description: White phosphorus (WP) is a white to light yellow, wax-like, luminous substance (phosphorescent in the dark). On ignition, it produces a yellow-white flame and dense white smoke. When dispersed by ammunition as small particles, it ignites spontaneously on exposure to air and continues to burn on contact with solid materials, even when embedded in human flesh. It is used in bursting-type projectiles, artillery and mortar shells, grenades, rockets, and bombs.

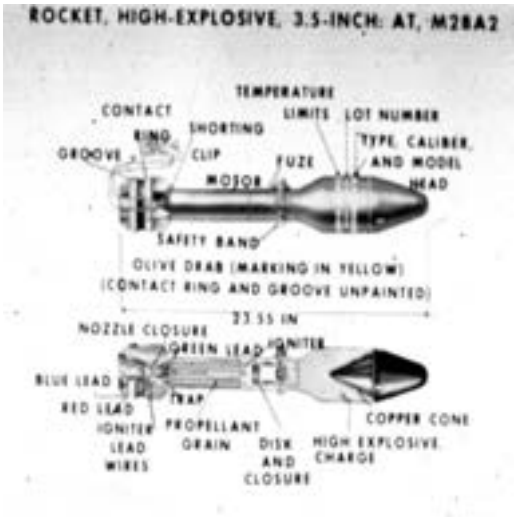
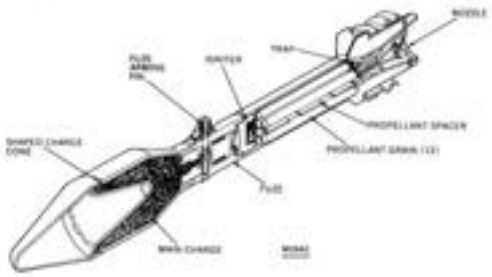
Ordnance Technical Data Sheet

U.S. Rocket, 3.5-Inch, HEAT, M28 and M28A2





Nomenclature:	U.S. Rocket, 3.5-Inch, HEAT, M28 and M28A2
Ordnance Family:	Rockets
DODIC:	H600
Filler:	Composition B
Filler weight:	853.00 g (30.09 oz)
Item weight:	4.10 kg (9.039 lbs)
Diameter:	89.00 mm (3.5 in)
Length:	598.00 mm (23.54 in)
Maximum Range:	Not Provided
Fuze:	Setback-armed, Base-detonating (BD)

Usage: These are ground-fired, fixed-fin rockets that use setback-armed, base-detonating (BD), non-delay, impact-inertia-fired fuzes and a high-explosive antitank (HEAT) shaped-charge warhead. The fuzes are painted olive drab or black and have the designation and loading information stamped on the body.

Description: The M28 warhead is olive drab with yellow markings; the M28A2 may have an olive drab or black warhead with yellow markings. Some M28A2 warheads with fuzes may be inert and painted blue. The rocket motor may be brown or olive drab with a brown band.

Filler (Main Charge) Description: Composition B consists of a mixture of TNT (Trinitrotoluene) and RDX (Cyclotrimethylenetrinitramine, Cyclonite, and Hexogen). It is used as a burster in Army projectiles, rockets, hand grenades, and landmines.

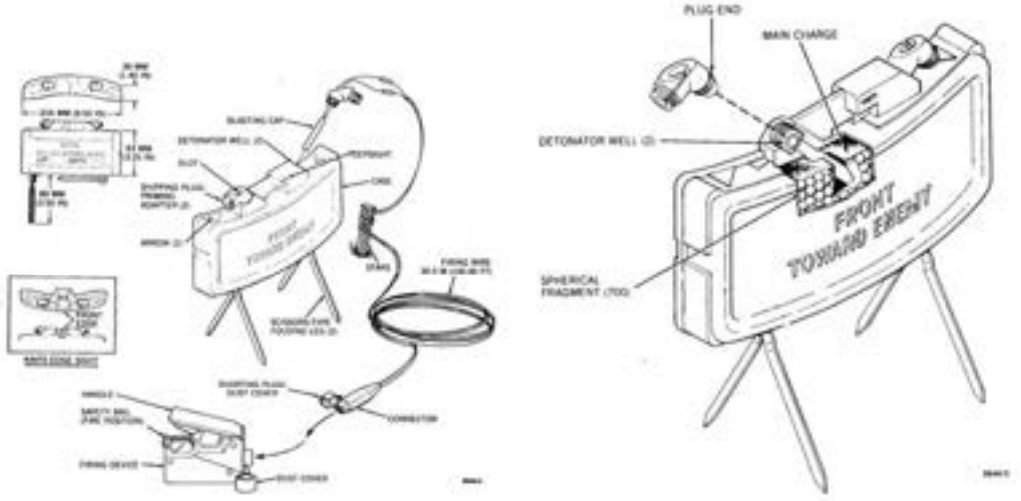
Ordnance Technical Data Sheet

U.S. Landmine, Apers, HE, M18A1 Claymore and Practice, M68



Nomenclature:	APERS, HE, M18A1 Claymore and Practice, M68
Ordnance Family:	Landmines
DODIC:	K143
Filler:	Composition C-4 (M18A1 only)
Filler weight:	680.00 g (23.99 oz)
Item weight:	1.60 kg (3.52 lbs)
Diameter:	216.00 mm (8.50 in)
Length:	83.00 mm (3.26 in)
Maximum Range:	Not Provided
Fuze:	Electric/non-electric command detonation

Usage: The M68 practice mine is similar to the M18A1 mine, except that the inert loaded M33 mine body replaces the high explosive loaded M18A1 mine body and the empty practice blasting cap M10 replaces the loaded blasting cap. The M18A1 is a directional, fragmentation, high explosive (HE), antipersonnel (apers) landmine that may be electrically or non-electrically initiated. It may be used as a controlled-fired mine in offensive or defensive situations.

Description: The M18A1 mine is olive drab.

Filler (Main Charge) Description: C-4 is a plastic demolition explosive consisting of RDX, other explosives, and plasticizers. C-4 can be molded by hand for demolition work and packed by hand into shape charge devices.

Note Taker: Jason Burcham

11/11/12

0730 – Swept an area offsite and determined it free of subsurface anomalies. Placed a MEC simulant on the surface and swept the item with a Schiebel MIMID on high setting. The instrument produced an audible signal indicating a positive detect and proper function. Survey commenced

1700 – Re-swept test strip. The instrument produced an audible signal indicating a positive detect and proper function. Departed site.

11/12/12

0730 - Re-swept test strip. The instrument produced an audible signal indicating a positive detect and proper function. Survey commenced.

1430 - Re-swept test strip. The instrument produced an audible signal indicating a positive detect and proper function. Survey Complete.

DEPARTMENT OF THE ARMY
OFFICE OF THE ASSISTANT SECRETARY
INSTALLATIONS AND ENVIRONMENT
110 ARMY PENTAGON
WASHINGTON, DC 20310-0110

APR 2 1 2005

MEMORANDUM FOR THE ASSISTANT CHIEF OF STAFF FOR INSTALLATION MANAGEMENT

SUBJECT: Munitions Response Terminology

1. This memorandum replaces my October 28, 2003 memorandum, subject: Definitions Related to Munitions Response Terms, and requests your office ensure that the enclosed terms and their definitions (Enclosure 1) are used, when appropriate, in correspondence (e.g., policies, guidance) and briefings concerning the Army's implementations of its Military Munitions Response Program (MMRP), Sustainable Range Management Program (SRMP) and, as appropriate, in other munitions-related matters.

2. In the past three years, the Department of Defense (DoD) has developed policies and guidance to implement its MMRP and SRMP. It has also worked to close a policy gap related to the management of material that may pose explosives hazards to DoD personnel and/or the public. During this period, DoD has been actively engaged, through the Munitions Response Committee (MRC), with the U.S. Environmental Protection Agency, Federal Land Managers, states, and with American Indians and Alaska Natives, to address issues related to the cleanup of munitions response sites.

3. To provide clarity and consistency in these efforts and in internal and external discussions, DoD has been working to establish and use common terms and definitions. The consistent use of accurate, descriptive terms, the definitions of which are commonly understood, is important to our dialogue with environmental regulators and safety officials, stakeholders, and the public.

4. Many of the terms that DoD has adopted for use in addressing munitions-related issues are now codified in Federal statute. On December 14, 2004, the Department of Defense Explosives Safety Board approved revisions to DoD 6055.9-STD, Ammunition and Explosives Safety Standards, using the enclosed terms.

5. The U.S. Army Technical Center for Explosives Safety, in coordination with other agencies, developed the enclosed matrix (Enclosure 2) to help the communities (e.g., operational, explosives safety, logistical, and cleanup) involved in addressing munitions-related operations to better understand how some of the new terms apply to actions they conduct.

Printed on Recycled Paper

6. Use of this terminology does not imply any specific funding authority, nor does it alter the DERP Management Guidance's program eligibility criteria.

7. My staff point of contact is J. C. King at (703) 697-5564 or jc.king@us.army.mil.

Enclosure 1: Military Munitions-Related Terms and Definitions

Consolidated Definitions
Anomaly Avoidance. Techniques employed on property known or suspected to contain UXO, other munitions that may have experienced abnormal environments (e.g., DMM), munitions constituents in high enough concentrations to pose an explosive hazard, or CA, regardless of configuration, to avoid contact with potential surface or subsurface explosive or CA hazards, to allow entry to the area for the performance of required operations.
Chain of Custody. The activities and procedures taken throughout the inspection, re-inspection and documentation process to maintain positive control of MPPEH to ensure the veracity of the process used to determine the status of material as to its explosive hazard. This includes all such activities from the time of collection through final disposition.
Chemical Agent (CA). A chemical compound (to include experimental compounds) that, through its chemical properties produces lethal or other damaging effects on human beings, is intended for use in military operations to kill, seriously injure, or incapacitate persons through its physiological effects. Excluded are research, development, testing and evaluation (RDTE) solutions; riot control agents; chemical defoliants and herbicides; smoke and other obscuration materials; flame and incendiary materials; and industrial chemicals.
Chemical Agent (CA) Hazard. A condition where danger exists because CA is present in a concentration high enough to present potential unacceptable effects (e.g., death, injury, damage) to people, operational capability, or the environment.
Chemical Agent (CA) Safety. A condition where operational capability and readiness, people, property, and the environment are protected from the unacceptable effects or risks of a mishap involving chemical warfare material (CWM) and CA in other than munitions configurations.
Chemical Warfare Material (CWM). Items generally configured as a munition containing a chemical compound that is intended to kill, seriously injure, or incapacitate a person through its physiological effects. CWM includes V- and G-series nerve agents or H-series (mustard) and L-series (lewisite) blister agents in other-than-munition configurations; and certain industrial chemicals (e.g., hydrogen cyanide (AC), cyanogen chloride (CK), or carbonyl dichloride (called phosgene or CG)) configured as a military munition. Due to their hazards, prevalence, and military-unique application, chemical agent identification sets (CAIS) are also considered CWM. CWM does not include: riot control devices; chemical defoliants and herbicides; industrial chemicals (e.g., AC, CK, or CG) not configured as a munition; smoke and other obscuration producing items; flame and incendiary producing items; or soil, water, debris or other media contaminated with low concentrations of chemical agents where no CA hazards exist.
Chemical Warfare Material (CWM) Response. Munitions responses and other responses to address the chemical safety; explosives safety, when applicable; human health; or environmental risks presented by CA-filled munitions and CA in other than munitions configurations. (See munitions response.)
Construction Support. Assistance provided by DoD EOD or UXO-qualified personnel and/or by personnel trained and qualified for operations involving CA, regardless of configuration, during intrusive construction activities on property known or suspected to contain UXO, other munitions that may have experienced abnormal environments (e.g., DMM), munitions constituents in high enough concentrations to pose an explosive hazard, or CA, regardless of configuration, to ensure the safety of personnel or resources from any potential explosive or CA hazards.
Cultural Debris. Debris found on operational ranges or munitions response sites, which may be removed to facilitate a range clearance or munitions response, that is not related to munitions or range operations. Such debris includes, but is not limited to: rebar, household items (refrigerators, washing machines, etc.), automobile parts and automobiles that were not associated with range targets, fence posts, and fence wire.
Defense Sites. Locations that are or were owned by, leased to, or otherwise possessed or used by the Department of Defense. The term does not include any operational range, operating storage or manufacturing facility, or facility that is used for or was permitted for the treatment or disposal of military munitions. (10 U.S.C. 2710(e)(1))
Discarded Military Munitions (DMM). Military munitions that have been abandoned without proper disposal or removed from storage in a military magazine or other storage area for the purpose of disposal. The term does not include unexploded ordnance, military munitions that are being held for future use or planned disposal, or military munitions that have been properly disposed of, consistent with applicable environmental laws and regulations. (10 U.S.C. 2710(e)(2))
Disposal. End of life tasks or actions for residual materials resulting from demilitarization or disposition operations.
Disposition. The process of reusing, recycling, converting, redistributing, transferring, donating, selling, demilitarizing, treating, destroying, or fulfilling other life-cycle guidance, for DoD property.

Documentation of the Explosives Safety Status of Material. Documentation attesting that material: (1) does not present an explosive hazard and is consequently safe for unrestricted transfer within or release from DoD control, or (2) is MPPEH, with the known or suspected explosive hazards stated, that is only transferable or releasable to a qualified receiver. This documentation must be signed by a technically qualified individual with direct knowledge of: (1) the results of both the material's 100 percent inspection and 100 percent re-inspection or of the approved process used and the appropriate level of re-inspection, and (2) the veracity of the chain-of-custody for the material. This signature is followed by the signature of another technically qualified individual who inspects the material on a sampling basis (sampling procedures are determined by DoD entity that is inspecting the material).
Environmental Regulators and Safety Officials. Include, but may not be limited to environmental regulators, environmental coordinators or hazardous material coordinators, law enforcement officers, and safety personnel of the U.S. Environmental Protection Agency (USEPA), American Indians and Alaska Natives, other Federal Land Managers, and/or the States. When appropriate, public health officials of various agencies may also be involved.
Explosive Hazard. A condition where danger exists because explosives are present that may react (e.g., detonate, deflagrate) in a mishap with potential unacceptable effects (e.g., death, injury, damage) to people, property, operational capability, or the environment.
Explosive Ordnance Disposal (EOD). The detection, identification, on-site evaluation, rendering safe, recovery, and final disposal of unexploded ordnance and of other munitions that have become an imposing danger, for example, by damage or deterioration.
Explosive Ordnance Disposal (EOD) Personnel. Military personnel who have graduated from the Naval School, Explosive Ordnance Disposal; are assigned to a military unit with a Service-defined EOD mission; and meet Service and assigned unit requirements to perform EOD duties. EOD personnel have received specialized training to address explosive and certain CA hazards during both peacetime and wartime. EOD personnel are trained and equipped to perform Render Safe Procedures (RSP) on nuclear, biological, chemical, and conventional munitions, and on improvised explosive devices.
Explosive Ordnance Disposal (EOD) Unit. A military organization constituted by proper authority; manned with EOD personnel; outfitted with equipment required to perform EOD functions; and assigned an EOD mission.
Explosives or Munitions Emergency Response. All immediate response activities by an explosives and munitions emergency response specialist to control, mitigate, or eliminate the actual or potential threat encountered during an explosives or munitions emergency. An explosives or munitions emergency response may include in-place render-safe procedures, treatment or destruction of the explosives or munitions, and/or transporting those items to another location to be rendered safe, treated, or destroyed. Any reasonable delay in the completion of an explosives or munitions emergency response caused by a necessary, unforeseen, or uncontrollable circumstance will not terminate the explosives or munitions emergency. Explosives and munitions emergency responses can occur on either public or private lands and are not limited to responses at RCRA facilities. (Military Munitions Rule, 40 CFR 260.10)
Explosives Safety. A condition where operational capability and readiness, people, property, and the environment are protected from the unacceptable effects or risks of potential mishaps involving military munitions.
Interim Holding Facility (IHF). A temporary storage facility designed to hold recovered chemical warfare material (RCWM).
Land Use Controls (LUC). LUC are physical, legal, or administrative mechanisms that restrict the use of, or limit access to, real property, to manage risks to human health and the environment. Physical mechanisms encompass a variety of engineered remedies to contain or reduce contamination and/or physical barriers to limit access to real property, such as fences or signs.
Long-Term Management (LTMgt). The period of site management (including maintenance, monitoring, record keeping, 5-year reviews, etc.) initiated after response (removal or remedial) objectives have been met (i.e., after Response Complete).
Material Potentially Presenting an Explosive Hazard (MPPEH). Material potentially containing explosives or munitions (e.g., munitions containers and packaging material; munitions debris remaining after munitions use, demilitarization, or disposal; and range-related debris); or material potentially containing a high enough concentration of explosives such that the material presents an explosive hazard (e.g., equipment, drainage systems, holding tanks, piping, or ventilation ducts that were associated with munitions production, demilitarization or disposal operations). Excluded from MPPEH are munitions within DoD's established munitions management system and other hazardous items that may present explosion hazards (e.g., gasoline cans, compressed gas cylinders) that are not munitions and are not intended for use as munitions.

Enclosure 1: Military Munitions-Related Terms and Definitions

Military Munitions. Military munitions means all ammunition products and components produced for or used by the armed forces for national defense and security, including ammunition products or components under the control of the Department of Defense, the Coast Guard, the Department of Energy, and the National Guard. The term includes confined gaseous, liquid, and solid propellants; explosives, pyrotechnics, chemical and riot control agents, smokes, and incendiaries, including bulk explosives, and chemical warfare agents; chemical munitions, rockets, guided and ballistic missiles, bombs, warheads, mortar rounds, artillery ammunition, small arms ammunition, grenades, mines, torpedoes, depth charges, cluster munitions and dispensers, demolition charges; and devices and components thereof. The term does not include wholly inert items; improvised explosive devices; and nuclear weapons, nuclear devices, and nuclear components, other than nonnuclear components of nuclear devices that are managed under the nuclear weapons program of the Department of Energy after all required sanitization operations under the Atomic Energy Act of 1954 (42 U.S.C. 2011 et seq.) have been completed. (10 U.S.C. 101(e)(4)(A) through (C))
Military Munitions Burial Site. A site, regardless of location, where military munitions or CA, regardless of configuration, were intentionally buried, with the intent to abandon or discard. This term includes burial sites used to dispose of military munitions or CA, regardless of configuration, in a manner consistent with applicable environmental laws and regulations or the national practice at the time of burial. It does not include sites where munitions were intentionally covered with earth during authorized destruction by detonation, or where in-situ capping is implemented as an engineered remedy under an authorized response action.
Minimum Separation Distance (MSD). MSD is the distance at which personnel in the open must be from an intentional or unintentional detonation.
Munition with the Greatest Fragmentation Distance (MGFD). The munition with the greatest fragment distance that is reasonably expected (based on research or characterization) to be encountered in any particular area.
Munitions and Explosives of Concern (MEC). This term, which distinguishes specific categories of military munitions that may pose unique explosives safety risks means: (A) Unexploded ordnance (UXO), as defined in 10 U.S.C. 101(e)(5); (B) Discarded military munitions (DMM), as defined in 10 U.S.C. 2710(e)(2); or (C) Munitions constituents (e.g., TNT, RDX), as defined in 10 U.S.C. 2710(e)(3), present in high enough concentrations to pose an explosive hazard.
Munitions Constituents (MC). Any materials originating from unexploded ordnance (UXO), discarded military munitions (DMM), or other military munitions, including explosive and non-explosive materials, and emission, degradation, or breakdown elements of such ordnance or munitions. (10 U.S.C. 2710(e)(3)).
Munitions Debris. Remnants of munitions (e.g., fragments, penetrators, projectiles, shell casings, links, fins) remaining after munitions use, demilitarization, or disposal.
Munitions Response. Response actions, including investigation, removal actions and remedial actions to address the explosives safety, human health, or environmental risks presented by unexploded ordnance (UXO), discarded military munitions (DMM), or munitions constituents (MC), or to support a determination that no removal or remedial action is required.
Munitions Response Area (MRA). Any area on a defense site that is known or suspected to contain UXO, DMM, or MC. Examples include former ranges and munitions burial areas. A munitions response area is comprised of one or more munitions response sites.
Munitions Response Site (MRS). A discrete location within an MRA that is known to require a munitions response.
Mutual Agreement. A meeting of the minds on a specific subject, and a manifestation of intent of the parties to do or refrain from doing some specific act or acts. Inherent in any mutual agreement or collaborative process are the acknowledgement of each member's role in the process and their differing views of their authorities. The mutual agreement process will provide a means of resolving differences without denying the parties an opportunity to exercise their respective authorities should mutual agreement fail to be achieved.
One Percent Lethality Distance. A distance calculated from a given CA Maximum Credible Event (MCE) and meteorological conditions (temperature, wind speed, Pasquill stability factor) and established as the distance at which dosage from that MCE agent release would be 150 mg-min/m^3 for H and HD agents, 75 mg-min/m^3 for HT agent, 150 mg-min/m^3 for Lewisite, 10 mg-min/m^3 for GB agent, 4.3 mg-min/m^3 for VX vapor, and 0.1 mg-min/m^3 for inhalation and deposition of liquid VX.

On-call Construction Support. Construction support provided, on an as needed basis, where the probability of encountering UXO, other munitions that may have experienced abnormal environments (e.g., DMM), munitions constituents in high enough concentrations to pose an explosive hazard, or CA, regardless of configuration, has been determined to be low. This support can respond from off-site when called, or be on-site and available to provide required construction support.
On-site Construction Support. Dedicated construction support, where the probability of encountering UXO, other munitions that may have experienced abnormal environments (e.g., DMM), munitions constituents in high enough concentrations to pose an explosive hazard, or CA, regardless of configuration, has been determined to be moderate to high.
On-the-Surface. A situation in which UXO, DMM or CA, regardless of configuration, are: (A) entirely or partially exposed above the ground surface (i.e., the top of the soil layer); or (B) entirely or partially exposed above the surface of a water body (e.g., because of tidal activity).
Open Burn (OB). An open-air combustion process by which excess, unserviceable, or obsolete munitions are destroyed to eliminate their inherent explosive hazards.
Open Detonation (OD). An open-air process used for the treatment of excess, unserviceable or obsolete munitions whereby an explosive donor charge initiates the munitions being treated.
Operational Range. A range that is under the jurisdiction, custody, or control of the Secretary of Defense and that is used for range activities; or although not currently being used for range activities, that is still considered by the Secretary to be a range and has not been put to a new use that is incompatible with range activities. (10 U.S.C. 101(e)(3)(A) and (B)). Also includes "military range," "active range," and "inactive range" as those terms are defined in 40 CFR §266.201.
Primary Explosives. Primary explosives are highly sensitive compounds that are typically used in detonators and primers. A reaction is easily triggered by heat, spark, impact or friction. Examples of primary explosives are lead azide and mercury fulminate.
Public Access Exclusion Distance (PAED). The PAED is defined as longest distance of the hazardous fragment distance, inhabited building distance (IBD) for overpressure, or the One Percent Lethality Distance. For siting purposes, the PAED is analogous to the IBD for explosives; therefore, personnel not directly associated with the chemical operations are not to be allowed within the PAED.
Qualified Receiver. Entities that have personnel who are, or individuals who are, trained and experienced in the identification and safe handling of used and unused military munitions, and any known or potential explosive hazards that may be associated with the MPPEH they receive; and are licensed and permitted or otherwise qualified to receive, manage, and process MPPEH.
Range. A designated land or water area that is set aside, managed, and used for range activities of the Department of Defense. The term includes firing lines and positions, maneuver areas, firing lanes, test pads, detonation pads, impact areas, electronic scoring sites, buffer zones with restricted access, and exclusionary areas. The term also includes airspace areas designated for military use in accordance with regulations and procedures prescribed by the Administrator of the Federal Aviation Administration. (10 U.S.C. 101(e)(1)(A) and (B))
Range activities. Research, development, testing, and evaluation of military munitions, other ordnance, and weapons systems; and the training of members of the armed forces in the use and handling of military munitions, other ordnance, and weapons systems. (10 U.S.C. 101(e)(2)(A) and (B))
Range Clearance. The destruction, or removal and proper disposition of used military munitions (e.g., unexploded ordnance (UXO) and munitions debris) and other range-related debris (e.g., target debris, military munitions packaging and crating material) to maintain or enhance operational range safety or prevent the accumulation of such material from impairing or preventing operational range use. "Range clearance" does not include removal, treatment, or remediation of chemical residues or munitions constituents from environmental media, nor actions to address discarded military munitions (e.g., burial pits) on operational ranges.
Range-Related Debris. Debris, other than munitions debris, collected from operational ranges or from former ranges (e.g., target debris, military munitions packaging and crating material).
Recovered Chemical Warfare Material (RCWM). CWM used for its intended purpose or previously disposed of as waste, which has been discovered during a CWM response or by chance (e.g., accidental discovery by a member of the public), that DoD has either secured in place or placed under DoD control, normally in a DDESB-approved storage location or interim holding facility, pending final disposition.

Render Safe Procedures (RSP). The portion of EOD procedures that involves the application of special disposal methods or tools to interrupt the functioning or otherwise defeat the firing train of UXO from triggering an unacceptable detonation.
Secondary Explosives. Secondary explosives are generally less sensitive to initiation than primary explosives and are typically used in booster and main charge applications. A severe shock is usually required to trigger a reaction. Examples are TNT, cyclo-1,3,5-trimethylene-2,4,6-trinitramine (RDX or cyclonite), HMX, and tetryl.
Small Arms Ammunition. Ammunition, without projectiles that contain explosives (other than tracers), that is .50 caliber or smaller, or for shotguns.
Team Separation Distance (TSD). The distance that munitions response teams must be separated from each other during munitions response activities involving intrusive operations.
Technical Escort Unit (TEU). A DoD organization manned with specially trained personnel that provide verification, sampling, detection, mitigation, render safe, decontamination, packaging, escort and remediation of chemical, biological and industrial devices or hazardous material.
Technology-aided Surface Removal. A removal of UXO, DMM or CWM on the surface (i.e., the top of the soil layer) only, in which the detection process is primarily performed visually, but is augmented by technology aids (e.g., hand-held magnetometers or metal detectors) because vegetation, the weathering of UXO, DMM or CWM, or other factors make visual detection difficult.
Time Critical Removal Action (TCRA). Removal actions where, based on the site evaluation, a determination is made that a removal is appropriate, and that less than 6 months exists before on-site removal activity must begin. (40 CFR 300.5)
Unexploded Ordnance (UXO). Military munitions that (A) have been primed, fuzed, armed, or otherwise prepared for action; (B) have been fired, dropped, launched, projected, or placed in such a manner as to constitute a hazard to operations, installations, personnel, or material; and (C) remain unexploded whether by malfunction, design, or any other cause. (10 U.S.C. 101(e)(5)(A) through (C)))
UXO Technicians. Personnel who are qualified for and filling Department of Labor, Service Contract Act, Directory of Occupations, contractor positions of UXO Technician I, UXO Technician II, and UXO Technician III.
UXO-Qualified Personnel. Personnel who have performed successfully in military EOD positions, or are qualified to perform in the following Department of Labor, Service Contract Act, Directory of Occupations, contractor positions: UXO Technician II, UXO Technician III, UXO Safety Officer, UXO Quality Control Specialist, or Senior UXO Supervisor.
Venting. Exposing any internal cavities of MPPEH, to include training or practice munitions (e.g., concrete bombs), using DDESB- or DoD Component-approved procedures, to confirm that an explosive hazard is not present.

Military Munitions-Related Terms (1)
How do they apply to specific types of material?

Type of Material (These are only examples.)	What is it **BEFORE** it is inspected for explosives hazards? (2) What is it **BEFORE** it is inspected? (16)		What is it **AFTER** it is inspected for explosive hazards?					
			If it presents an explosive hazards?			If it does not present an explosive hazards?		
	MPPEH	Other	MEC			MC (5)	Munitions Debris	Other
			UXO	DMM (3)	MC (4)			
Used military munition, on a range, fired	X		X				X	
Unused military munition, on a range, apparently discarded	X			X			X	
Used military munition, in a burial pit, on an operational range or on former ranges	X		X (6)				X	
Unused military munition, in a burial pit on an operational range or on former ranges	X			X (6)			X	
Explosives in the soil	X				X (7)	X		
Refrigerator, nails, soft drink cans, old fence wire, etc.		(8)	NA	NA	NA			(8)
Used cartridge cases, from a range, with live unused munitions possibly mixed in	X			X			(9)	
Target from a range (other than small arms range)	X		(10)	(10)	(10)			(11)
Remnants of munitions from an operational range or former range	X		X (12)	X (12)	X (12)		X (13)	
Kicked out military munition from a former open burn or open detonation ground	X			X (14)			X	
Residual MC in a melt kettle of a former (closed) explosive cast loading building	X		(15)	(15)	X (15)	X		X (16)
Residual MC in a floor drain pipe from an explosives-laden wash water drain of a former (closed) explosives cast loading facility.	X		(15)	(15)	X (15)			X (16)
Residual MC in cracks in floor slab (and in soil underneath floor cracks) in a former explosives manufacturing building	X		(15)	(15)	X (15)	X		X (16)
Small arms bullets or lead particulates n the soil from small arms use at a former small arms range used only for firing small arms ammunition		X (17)	Not Applicable (17)			X		

Note: The examples in this table are not all inclusive. The numbers in the table refer to footnotes that are found on the next page. It is important to read the footnotes, as they provide additional information of importance to understanding.

Enclosure 2

Endnotes:

(1) DoD has been working to standardize terms related to military munitions.

(2) Before material that is considered MPPEH can be either transferred within or released from DoD, its explosives safety status must be determined (see definition--Documentation of the Explosives Safety Status of Material). The type material involved determines the type of inspection (e.g., visual examination, chemical analysis, X-ray) required. Personnel qualified to determine the status of the particular material being examined must perform required inspections. For example, EOD and UXO-qualified personnel may inspect UXO and DMM during a munitions response or during range clearance activities. A QASAS or certified Wage Grade ammunition operator may inspect steamed-out projectiles at a depot's steam-out operation. A laboratory technician may perform a chemical analysis of soil to determine the percent explosives in the soil.

(3) Munitions generally considered as DMM include: buried munitions; un-recovered kick outs from open detonations; munitions left behind or discarded accidentally during munitions-related activities; munitions intentionally disposed of without authorization during munitions-related activities. Munitions removed from storage for the purpose of disposal that are awaiting disposal are not DMM.

(4) This is MC that is both (a) an explosive; and (b) present in sufficient concentrations to present explosive hazards.

(5) This is MC that is either (a) not an explosive (e.g., lead, beryllium, and cadmium); or (b) an explosive not present in sufficient concentrations to present explosive hazards.

(6) Although military munitions in a burial pit will normally be DMM, some may be UXO. For explosives safety reasons, munitions in a burial pit should be approached as UXO until assessed by technically qualified personnel (e.g., EOD personnel, UXO-qualified personnel) and determined that they are not UXO or that they do not present explosive hazards similar to UXO.

(7) Explosive soil is typically found in sumps and settling lagoons for explosives-laden wastewater, and in and around drainage ditches and pipes that carry the wastewater to such sumps and lagoons.

(8) These items are cultural debris.

(9) After determination of their explosives safety status, used cartridge cases documented as safe would, after any demilitarization required to remove their military characteristics, be available for release from DoD. In addition to these DoD requirements, other regulatory criteria may apply.

(10) A target is a type of range-related debris. Although a target is not MEC, it may contain UXO, DMM, or MC. Prior to its release from DoD control, its explosives safety status must be documented.

(11) A target's explosives safety status must be documented and any demilitarization required to remove its military characteristics must be performed prior to its release from DoD control.
(12) UXO, DMM, or MC may be found on operationalranges and on former ranges (previously referred to as closed, transferring or transferred ranges). An inspection of the material will determine into which category this material falls. For example, if a projectile breaks apart on impact, one could find (a) a sheared-off fuze, which would be UXO or (b) explosive filler, which would be MC, that broke away from the projectile's open body. If during an open detonation of an unserviceable munition that is conducted on an operational range, the donor charge detonates, but the munition being destroyed breaks up, but does not detonate, the remnants of the munition would be DMM or, if explosive residue (e.g., clumps of TNT), MC.
(13) After determination of its explosives safety status, scrap metal from used munitions on a range that is documented as safe would, after any demilitarization required to remove its military characteristics, be available for release from DoD control. In additions to these DoD requirements, other regulatory criteria may apply.
(14) Prudent safety practice is to consider kick outs, which have experienced an unknown environment, to be equally dangerous and managed like UXO until technically qualified personnel assess and determine that they are not UXO or do not present explosive hazards similar to UXO.
(15) Of itself, such material (e.g., mettle kettle, drainpipes, floor slabs) do not present an explosive hazard and would not be classified as UXO, DMM or MC. However, residual MC (e.g., TNT, RDX, HMX) could remain in such material in high enough concentrations to present an explosive hazard.
(16) After determination of its explosives safety status, such material (e.g., mettle kettle, drainpipes, floor slabs) when documented as safe would be available for release from DoD control. In addition to this DoD requirement, other regulatory criteria may apply.
(17) At operational ranges or former ranges used exclusively for live fire of small arms ammunition, some unfired small arms ammunition may be found. Although this ammunition is considered DMM and would be MPPEH, it is not considered to present a significant explosive hazard.

1.0 Executive Summary

The South Carolina Army National Guard has prepared this Pre-Construction Site Assessment (PCA) Report for the Range Development Plan EA, hereafter referred to as the "target property." The Site is located at 5401 Leesburg Rd, Columbia, SC 29044. This PCA was prepared in anticipation of range construction in at McCrady Training Center.

This PCA Report was conducted in conformance with Army guidance, *Army Regulation (AR) 200-1, Environmental Protection and Enhancement (*Feb 1997), *ARNG Environmental Condition of Property SOP (*Mar *2007), Army National Guard Environmental Condition of Property Handbook (June 2001) and the Standard Practice for Conducting Pre-Construction Site Assessments, Phase I Environmental Site Assessment Process,* American Society for Testing & Materials (ASTM) E 1527-05 as secondary guidance when it was not inconsistent with the primary guidance.

This PCA Report details the history of the property, including the SCARNG and any prior tenant uses of the Site and the resulting environmental condition of the property.

The entire property is on approximately 15,000 acres and contains 217 permanent structures.

Based on a review of interviews and aerial photographs and U.S. Geological Survey topographical maps dating back to 1937, the target property was originally rural area located east of the city of Columbia. The property has been used as a military training facility since 1917, except for a brief break from 1921-1925.

Areas of potential environmental concern were reviewed and no significant concerns relating to environmental condition of the target property were found. In accordance with Department of Defense (DoD) policy defining the classifications, the target property has been overall classified as Category I with UXO areas classified as Category III.

2.0 Introduction

2.1 Location & Property Identification

The proposed site is located in the central portion of South Carolina (see Appendix A - Maps). The Multi Purpose Machine Gun (MPMG), Modified Record Fire (MRF), and 10/25m zero range target properties are located at 34 Degrees 0' 24.48" North LAT and 80 Degrees 49' 9.48" West LONG. See Appendix A for the Map showing exact target property locations. The EDR report was based off of the midpoint of the MPMG, MRF, and 10/25m zero ranges. The close proximity of the ranges allowed one report to accurately address all three within one search radius. The Live Fire Shoothouse is to be located at 34 Degrees 1' 45.84" North LAT and 80 Degrees 42' 22.68" West LONG. The target property address is: 5411 Leesburg Rd, Columbia, SC 29223.

2.3 Methodology

The ESA was conducted in three phases. The first phase was to compile background information. This was accomplished though document reviews, gathering of aerial photos and background interviews (see Appendix D for interview contact list). The second phase was a site reconnaissance. Three members of the SCARNG ERC Team inspected the site on 1/30/12. The final phase was to compile all the information to create the PCA to be used for making the final environmental determination for construction of proposed ranges.

3.0 Property Description & Environmental Setting

3.1 Property Description

The property is currently licensed to the SC Army National Guard for use as a military training facility. The target sites are licensed to the SC Army National Guard for use as live fire shooting ranges. The entire property is on approximately 15,000 acres licensed to the Army National Guard and contains 0 permanent structures in the actual target site footprints. There are, however, several sheds and other shooting-related open air structures in the area surrounding the 10/25m zero range. These structures receive water from a local well and use septic systems. No heat is provided to these structures. The MPMG range site is located in proximity to a weather station structure that uses no water or septic system. No heat is provided to this station. The MRF range site is not located in the proximity of any permanent structures. The Live Fire Shoothouse is not located in close proximity to any existing permanent structures.

3.2 Surrounding Land Use

The target property is located in Richland County, South Carolina. The surrounding areas appear to be rural and residential.

3.3 Surface Water

There was no permanent surface water areas present at the target locations. In addition, there were no temporary standing water areas at the target locations. This information is based on aerial photography and site maps as well as visual inspection during the site visits on January 30, 2012.

3.4 Topography

The general topography of the property and surrounding areas appears to be slightly sloped towards the South. The site elevation is 340 feet above sea level for the MPMG, MRF, and 10/25m zero ranges. The site elevation is 232ft above sea level for the Live Fire Shoothouse. The general topography appears to be slightly sloped towards the South for the Live Fire Shoothouse as well. See Appendix C (Environmental Risk Assessment / Geocheck – Physical Setting Source Summary) for more information.

3.5 Geology

The geology of the target MPMG, MRF and 10/25m zero range sites and surrounding area is of the following composition: Rock Stratigraphic Unit is of the Mesozoic Era, the Cretaceous System, the Woodbine and Tuscaloosa Groups Series and UK1 Code and a Stratified Sequence Category. There are 5 dominant soil compositions in the general area of the target property.

- The first dominant soil composition is Lakeland component, sand surface texture and of the Class A Hydrologic Group. The Soils Drainage Class is of the "Excessively drained" category and does not meet the requirements for a hydric soil. Depth to water table is greater than zero (0) inches.
- The second dominant soil composition is Blanton component, sand surface texture and of the Class A Hydrologic Group. The Soils Drainage Class is of the "moderately well drained" category and does not meet the requirements for a hydric soil. Depth to water table is greater than 122 inches.
- The third dominant soil composition is Ailey component, loamy sand surface texture and of the Class B Hydrologic Group. The Soils Drainage Class is of the "well drained" category and does not meet the requirements for a hydric soil. Depth to water table is greater than 0 inches.
- The fourth dominant soil composition is Johnston component, loam surface texture and of the Class D Hydrologic Group. The Soils Drainage Class is of the "very poorly drained" category and meets the requirements for an all hydric soil. Depth to water table is greater than 0 inches.
- The fifth dominant soil composition is Lakeland component, sand surface texture and of the Class A Hydrologic Group. The Soils Drainage Class is of the "excessively drained" category and does not meet the requirements for a hydric soil. Depth to water table is greater than 0 inches.

More information on soils types can be found in Appendix C – "Geocheck – Physical Setting Source Summary."

The Geology of the target Live Fire Shoothouse and surrounding area is of the following composition: Rock Stratigraphic Unit is of the Mesozoic Era, the Cretaceous System, the Woodbine and Tuscaloosa Groups Series and UK1 Code and a Stratified Sequence Category. There are 5 dominant soil compositions in the general area of the target property.

- The first dominant soil composition is Vaucluse component, loamy sand surface texture and of the Class C Hydrologic Group. The Soils Drainage Class is of the "well drained" category and does not meet the requirements for a hydric soil. Depth to water table is greater than zero (0) inches.
- The second dominant soil composition is Johnston component, loam surface texture and of the Class D Hydrologic Group. The Soils Drainage

Class is of the "very poorly drained" category and meets the requirements for an all hydric soil. Depth to water table is greater than zero (0) inches.

- The third dominant soil composition is Pelion component, loamy sand surface texture and of the Class B/D Hydrologic Group. The Soils Drainage Class is of the "moderately well drained" category and meets the requirements for a partially hydric soil. Depth to water table is greater than 30 inches.
- The fourth dominant soil composition is Ailey component, loamy sand surface texture and of the Class B Hydrologic Group. The Soils Drainage Class is of the "well drained" category and does not meet the requirements for a hydric soil. Depth to water table is greater than 0 inches.
- The fifth dominant soil composition is Lakeland component, sand surface texture and of the Class A Hydrologic Group. The Soils Drainage Class is of the "excessively drained" category and does not meet the requirements for a hydric soil. Depth to water table is greater than 0 inches.

More information on soils types can be found in Appendix C – "Geocheck – Physical Setting Source Summary."

3.6 Hydrological

The EDR report indicates the FEMA Flood Zone and the National Wetland Inventory Data for this site. The subject MPMG, MRF, 10/25m zero range and Live Fire Shoothouse properties are not shown to be in a flood plain. The Overview Map (Map 3248581.2s - page 9 of 60 in the radius report), contained in Appendix C, does show that there are seven (7) national wetlands inventory zones within 1 mile of the MPMG, 10/25m zero, and MRF range target properties in all directions of the target properties. The Overview Map (Map 3248581.9s – page 9 of 52 in the radius report), contained in Appendix C, does show that there are eight (8) national wetlands inventory zones within 1 mile of the Live Fire Shoothouse target property in all directions of the target properties. See maps located in Appendix A and Appendix C for more information.

3.7 Sensitive Environmental & Natural/Cultural Resources

Per the EDR data, there are no listed Designated Wilderness Areas, Designated Wildlife Preserve Areas or Critical Habitat within 1 mile of target property.

The MPMG, MRF, and 10/25m Zero Ranges are proposed in an area that has the potential to impact the federally listed red cockaded woodpecker habitat. An extensive biological assessment of the potential impacts is being completed in coordination with the US Fish and Wildlife Service to better define the impacts. There is also potential habitat for two endangered plant species on McCrady Training Center; however the proposed location of these ranges and Shoothouse is not expected to impact these species. See Appendix F: "Biological Assessment", for further details.

Evaluations pursuant to Section 106 of the National Historic Preservation Act were conducted on all possible target site areas. Past Cultural Resource Surveys, GIS data and on site investigations were used to determine the potential impacts to Cultural and Historic resources. The historical Inchon Range (located within the proposed footprint of the MFR Range) has been deemed "Eligible for Listing" for the National Register and the SCARNG is currently working with the SHPO to create mitigation measures for this property.

4.0 Past & Current Operations

4.1 Land Use History

This property is currently used as a military training facility. The property was originally established as a military training facility in 1917 by the state of South Carolina. It was transferred to the Federal Government in 1939, and is licensed to the state of South Carolina for use as a military training facility currently. For more information see "Final Site Inspection Report" in Appendix G: Works Cited.

4.2 Regulatory Records Analysis

Federal, State, and EDR records have been reviewed to prepare this PCA.

4.3 Analysis of Aerial Photography

Aerial photography of the site was analyzed after the site visit. The aerial photographs analyzed are included in Appendix C – Environmental Risk Assessment of this PCA. The Historical Aerial Photo Decade Maps obtained for the MPMG, MRF, and 10/25m zero ranges are for years 1961, 1971, 1978, 1983, 1994, 2005, and 2006. Below are summaries of the aerial photographs:

1961

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded with no signs of development.

1971

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded with no signs of residents.

1978

Target Property area appears to be rural and wooded, with the addition of Weston Lake. The surrounding areas are also rural and wooded with minimal residential development.

1983

Target Property area appears to be rural and wooded with slightly increasing military development compared to previous images. The surrounding areas are also rural and wooded.

1994

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded.

2005

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded.

2006

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded.

The Historical Aerial Photo Decade Maps obtained for the Live Fire Shoothouse are for years 1961, 1976, 1983, 1989, 1994, 1999, 2005, and 2006. Below are summaries of the aerial photographs:

1961

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded, with very minimal residential area mixed in.

1976

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded, with very minimal residential area mixed in.

1983

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded, with very minimal residential area mixed in.

1989

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded, with very minimal residential area mixed in.

1994

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded, with very minimal residential area mixed in.

1999

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded, with very minimal residential area mixed in.

2005

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded, with very minimal residential area mixed in.

2006

Target Property area appears to be rural and wooded. The surrounding areas are also rural and wooded, with very minimal residential area mixed in.

4.4 Historical Records

Historical Topographic Maps were obtained for the target property area. Appendix C contains the "EDR Historical Topographic Map Report" which was also reviewed by SCARNG. The results of these topographic maps review is summarized below for the MPMG, MRF, and 10/25m zero range locations:

1937:
Target Property area appears to rural. The surrounding areas appear to be rural and military training areas.

1953:

Target Property area appears to rural. The surrounding areas appear to be rural and military training areas.

1972:

Target Property area appears to rural. The surrounding areas appear to be rural and military training areas.

1986:

Target Property area appears to rural. The surrounding areas appear to be rural and military training areas.

The adjacent areas were also reviewed and the results are as follows:

1943:

Target Property area appears to rural. The surrounding areas appear to be rural and military training areas.

1953:

Target Property area appears to rural. The surrounding areas appear to be rural and military training areas.

1972:

Target Property area appears to rural. The surrounding areas appear to be rural and military training areas.

1982:

Target Property area appears to rural. The surrounding areas appear to be rural and military training areas.

1987:

Target Property area appears to rural. The surrounding areas appear to be rural and military training areas.

The topographic maps for the Live Fire Shoothouse were also reviewed and the results are as follows:

1938:

Target Property area appears to rural. The surrounding areas appear to be rural and military training areas.

1953:

Target Property area appears to rural. The surrounding areas appear to be rural and military training areas.

1986:

Target Property area appears to rural. The surrounding areas appear to be rural and military training areas.

4.5 Hazardous Materials Use, Handling and Storage

The chemicals used and stored on site are primarily associated with UXO and other military training related munitions. Any hazardous materials and wastes are properly managed and stored per State and Federal Laws and regulations and as such there is no reason to believe said chemicals and wastes pose a significant risk to the project.

4.6 Hazardous Waste Generation, Handling and Storage

Any hazardous materials and wastes are properly managed and stored per State and Federal Laws and regulations and as such there is no reason to believe said chemicals and wastes pose a significant risk to the project.

4.7 Petroleum Products Use, Handling and Storage

There are currently no underground or above ground storage tanks in the immediate vicinity of the proposed range sites. This is confirmed by the EDR report, as well as an interview with Linda A. Johnson, Environmental Compliance Manager, SCARNG. See Appendix D: "Interviews" for more information. There are storage tanks in the McCrady Training Center Cantonment area; however these are more than one mile from the target sites and are not deemed to be of concern.

4.8 Other Environmental Contamination

Several of the range locations have UXO (Unexploded Ordnance) within the range limits. These areas will be surveyed by an outside agency and cleared by UXO removal prior to construction. These UXO areas can be seen in ECOP maps located in Appendix A: "Site Maps". UXO presence is indicated by a MILCON level III category and will be color coded yellow. Per industry standards, UXO at the target site are not deemed to be a hazardous substance because it is within the realm of range operations and was used for its intended purpose.

There is no evidence to suggest any other environmental contamination in the areas proposed for the construction of any of the ranges. This is determined from the data provided in the EDR report, as well as information obtained through interviews. For any site specific contamination found, see section entitled 5.0 Site Reconnaissance.

5.0 Site Reconnaissance

Three members of the SCARNG ERC staff, Mark Mohr, Deputy Conservation Manager, Brittanie Young, Environmental Review Manager, and Joe Adams, SCARNG Intern, visited the proposed target site locations on January 30, 2012. The investigation included a walkthrough of the site and taking representative photos of the area.

At the proposed 10/25m zero range site, a leaking 55 gallon drum was discovered approximately 75 yards from the proposed range. There was a plastic-like substance spread around one end of the drum; however it did not appear to have leached into the soil. On February 23, 2012, a sample of the previously mentioned spill was taken for further investigation. After further investigation, the substance found at the previously mentioned drum was determined to be a plastic portion of the drum itself which was melted during a prescribed fire, conducted for forestry management. Living vegetation was observed in close proximity to the spill, and given that the substance was deemed to be melted plastic, there is no reason to believe that a significant threat is posed to the target site or its future construction activities. This spill is deemed a de minimis finding. A suspicious mound of dirt was also discovered at the site, approximately 50-75 yards from the proposed range. On February 23, 2012 the mound of dirt was probed and deemed to be the result of a nearby roadbed. This mound poses no significant risk to the construction of this range.

The proposed MPMG range site was also visited. A walkthrough of the area was conducted and pictures were taken. No evidence of spills or contamination was found at this site. There was no evidence found that would indicate any hazards or concerns with proceeding with this range. On March 27, 2012, the MPMG site was revisited to complete a Biological Assessment. During this walkthrough, a small area of debris was discovered which appears to be the remains of past human activities in the area. The exact source of the debris could not be determined; however the debris appears to contain a burn barrel, and other small pieces of metal. There is no evidence of chemical presence or other environmental hazards, and this is deemed as a de minimis finding.

The proposed MRF range site was also visited. A walkthrough of the area was conducted and pictures were taken. There was no evidence of spills or

contamination at this site, or any other indications of hazards that could interfere with the construction of this range.

The proposed Live Fire Shoothouse site was visited on February 22, 2012 by the aforementioned group. A walkthrough of the area was conducted and pictures were taken. No evidence of spills or contamination was found at this site. Three concrete structures were discovered in close proximity to the target site, which appear to be the remains of past military training activities. No evidence was discovered to suggest any threats or hazards to proceeding with construction.

Photographs can be found in Appendix B: "Site Photos".

6.0 Response Action

There currently no current or closed response actions regarding the target property. This is confirmed by review of the EDR report and interviews with SCARNG environmental compliance personnel.

7.0 Findings on Adjacent Properties

7.1 Federal & State Records Search

The target property address of 2563 Essayons Way, Columbia, SC 29223 for the MPMG, 10/25m zero, and MRF ranges does not show the ranges to be listed on any databases per the EDR Report. This address is the location of Fort Jackson and was used to ensure the reporting of any incidents assigned to that address that may impact this proposed project. The target property address of 5411 Leesburg Rd for the Live Fire Shoothouse does not show the range to be listed on any databases per the EDR Report.

A review of EDR records shows zero (0) Resource Conservation and Recovery Act (RCRA) Small Quantity Generator (SQG) within 0.25 miles of the target properties.

The National Priority List (NPL) has revealed that there are zero (0) NPL Sites within approximately 1 mile of the target properties.

A review of the State Hazardous Waste Sites (SHWS) records which are an equivalent to the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) list, has revealed that there are zero (0) SHWS sites within approximately 1 mile of the target properties.

The State Groundwater Contamination Inventory Cases (GWCI) List has revealed that there are zero (0) GWCI sites within approximately 0.5 miles of the target properties.

The Leaking Underground Storage Tank (LUST) database showed records of zero (0) LUST sites within approximately 0.5 miles of the target properties.

The Underground Storage Tank (UST) database has revealed that there are zero (0) UST sites within approximately 0.25 miles of the target properties.

The Aboveground Storage Tank (AST) database has revealed that there are zero (0) AST sites within approximately 0.25 miles of the target properties.

The environmental database search yielded thirteen (13) unmapped orphan sites for the MPMG, 10/25m zero, and MRF ranges. The environmental database search yielded seventeen (17) unmapped orphan sites for the Live Fire Shoothouse. Unmapped sites are those with address information sufficient only to identify as within the zip code of the Target Site. These sites were identified and/or estimated the location of each site as well as their potential environmental risk to the target property. After consideration, none of the unmapped sites were deemed to be on significant environmental risk. See Appendix C – Environmental Risk Assessment and Appendix E – Orphan Sites for details on findings in the adjacent properties.

7.2 Historical Activities & Current Use

Historically, the activities on this land have been military training based activities. The 10/25m zero range has evidence of fence posts and barbed wire which marked the boundaries for other ranges previously located in this area. The Live Fire Shoothouse location has three concrete structures in the immediate vicinity that were previously used in training activities for the base. The Modified Record Fire range has evidence of previous anti-tank training activities in the form of trenches that housed a conveyor system for a tank-like target. See "Historical Survey and Evaluation of the Inchon 1000-Inch Miniature Anti-Tank Range, Fort Jackson, SC" located in Appendix G: "Works Cited" for more information. Prior to this use, the area was undeveloped wooded area.

There was no evidence of historic or current uses of the adjacent property that would negatively impact the property that SCARNG proposes to construct the proposed ranges on. The only concern for the target properties is the presence of UXO in some proposed range areas. These areas will be cleared prior to construction. For more information, see Appendix A: "Site Maps."

8.0 Conclusions

8.1 Environmental Condition of the Property

The property is in good environmental condition and is well suited for additions and alterations. The Environmental Condition of Property (ECOP) has been overall classified as Category I (there is no reason to expect contamination will be encountered during the construction) with UXO areas classified as Category III (site is known to be contaminated or there is strong suspicion contamination will be encountered during construction). Because of the nature of the proposed ranges and the construction involved, effects from contaminated sites within 0.125 to 1.0 mile radius of the target property should not pose any adverse environmental impacts. It is the determination of the SCARNG ERC that this property is environmentally suitable for additions and alterations.

8.2 Known or Suspected Issues with Transfer Restrictions

N/A

8.3 Recommendation

The property is in good environmental condition and is well suited to meet the requirements of the SCARNG. Environmental considerations should not prevent the alterations of this property.

9.0 Certification

The Environmental Resources Center (ERC) of the South Carolina Army National Guard conducted the Environmental Baseline Study and prepared this document. The principles in the document creation are listed below.

Lead Investigator: Mark Mohr, SCARNG Deputy Conservation Manager

Brittanie Young, SCARNG Environmental Review Manager

Joe Adams, SCARNG Environmental Intern

Contributing Investigators: N/A

The ERC staff has reviewed all appropriate records made available and conducted a visual inspection of the site following an analysis of the information from the records search. The information contained within this report is based on records made available, and to the best of the investigators knowledge, is current and accurate as of 17 April, 2012.

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

The Sanborn Library includes more than 1.2 million Sanborn fire insurance maps, which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ✔ Library of Congress
- ✔ University Publications of America
- ✔ EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

The Military Dept., State of SC (the client) is permitted to make up to THREE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

DOD: Consists of federally owned or administered lands, administered by the Department of

Defense, that have any area equal to or greater than 640 acres of the United States, Puerto Rico, and the U.S. Virgin Islands.

A review of the DOD list, as provided by EDR, and dated 12/31/2005 has revealed that there is 1 DOD site within approximately 1 mile of the target property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

State and tribal voluntary cleanup sites

VCP: Voluntary Cleanup Sites
Sites participating in the Voluntary Cleanup Program. Once staff and a non-responsible party have agreed upon an approved scope of work for a site investigation and/or remediation, the party enters into a voluntary cleanup contract. Staff oversees the cleanup efforts to ensure that activities are performed to our satisfaction. Upon completion of the negotiated work in the voluntary cleanup contract, the non-responsible party receives State Superfund liability protection.

Data Release Frequency: Varies

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Date of Government Version: 06/27/2011

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 10/07/2011
Date Data Arrived at EDR: 12/09/2011
Date Made Active in Reports: 01/10/2012

Data Release Frequency: Quarterly

ALLSITES: Site Assessment & Remediation Public Record Database
The South Carolina Department of Health and Environmental Control is pleased to have the Public Record for your review. The purpose of this database is two-fold. First, it will provide to communities another form of notice of cleanup activity, allowing them to have more information about assessment and cleanup activities in their area and in the State. Second, it can assist those seeking to redevelop brownfield properties within South Carolina.

Date of Government Version: 11/16/2011

Other Ascertainable Records

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

Data Release Frequency: Quarterly

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

SCRD DRYCLEANERS: State Coalition for Remediation of Drycleaners Listing

The State Coalition for Remediation of Drycleaners was established in 1998, with support from the U.S. EPA Office of Superfund Remediation and Technology Innovation. It is comprised of representatives of states with established drycleaner remediation programs. Currently the member states are Alabama, Connecticut, Florida, Illinois, Kansas, Minnesota, Missouri, North Carolina, Oregon, South Carolina, Tennessee, Texas, and Wisconsin.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 11/21/2011
Date Data Arrived at EDR: 11/22/2011

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: Rextag Strategies Corp.
Telephone: (281) 769-2247
U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Child Day Care List
Source: Department of Social Services
Telephone: 803-898-7345

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetlands Inventory
Source: Department of Natural Resources
Telephone: 803-734-9494

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

Elevation:	232 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	34080-A6 LEESBURG, SC
Most Recent Revision:	1953

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

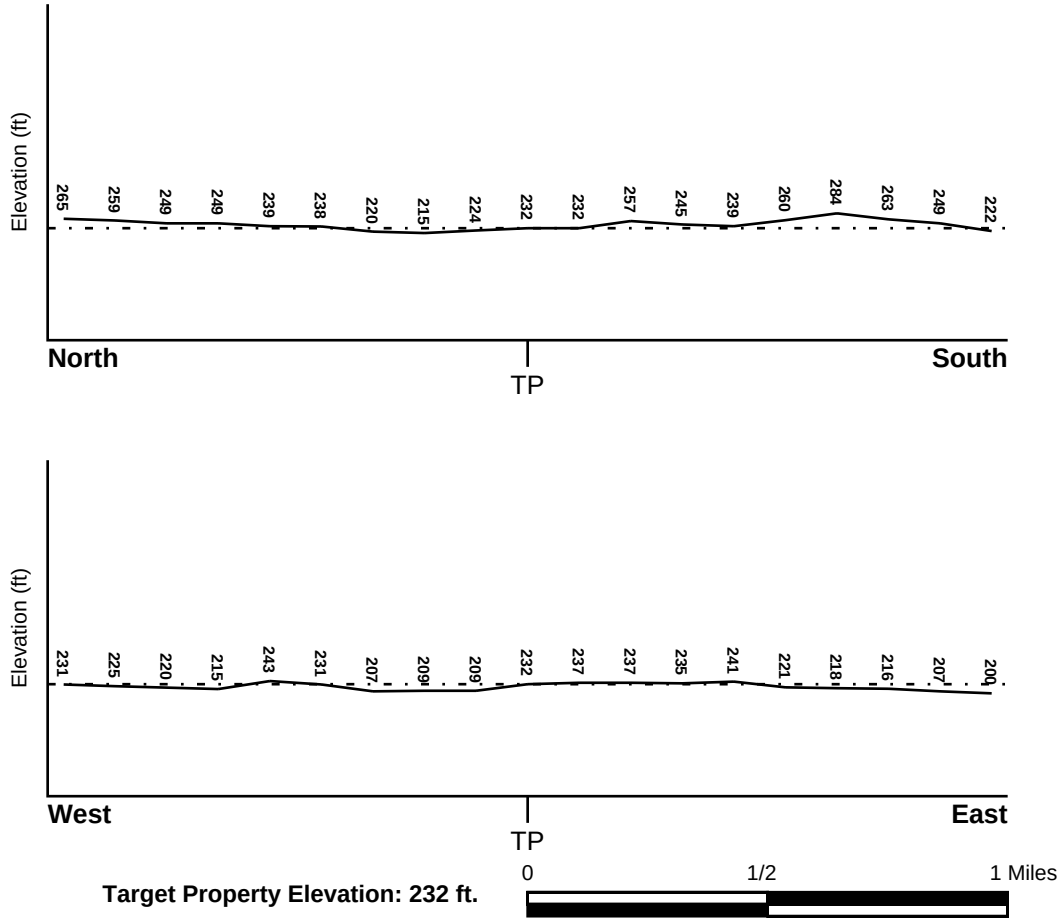
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
RICHLAND, SC	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 45079C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
LEESBURG	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Vaucluse

Soil Surface Texture: loamy sand

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 5.5 Min: 3.6
2	5 inches	14 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 5.5 Min: 3.6
3	14 inches	29 inches	sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 5.5 Min: 3.6

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
4	29 inches	57 inches	sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 5.5 Min: 3.6
5	57 inches	72 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 5.5 Min: 3.6

Soil Map ID: 2

Soil Component Name: Johnston

Soil Surface Texture: loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Very poorly drained

Hydric Status: All hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	9 inches	loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 5.5 Min: 4.5

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
2	37 inches	66 inches	stratified sandy loam to fine sandy loam to sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 5.5 Min: 4.5
3	9 inches	37 inches	mucky loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 5.5 Min: 4.5

Soil Map ID: 3

Soil Component Name: Pelion

Soil Surface Texture: loamy sand

Hydrologic Group: Class B/D - Drained/undrained hydrology class of soils that can be drained and are classified.

Soil Drainage Class: Moderately well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 30 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 6 Min: 3.6

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
2	5 inches	7 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 6 Min: 3.6
3	7 inches	25 inches	sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 6 Min: 3.6
4	25 inches	57 inches	sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 6 Min: 3.6
5	57 inches	57 inches	sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 6 Min: 3.6
6	57 inches	74 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 6 Min: 3.6

Soil Map ID: 4

Soil Component Name: Ailey

Soil Surface Texture: loamy sand

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Map ID: 5

Soil Component Name: Lakeland

Soil Surface Texture: sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	29 inches	sand	Not reported	Not reported	Max: 141 Min: 42	Max: 6 Min: 4.5
2	29 inches	98 inches	sand	Not reported	Not reported	Max: 141 Min: 42	Max: 6 Min: 4.5

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetlands Inventory
Source: Department of Natural Resources
Telephone: 803-734-9494

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Natural Resources
Telephone: 803-734-6440
Water wells in the Coastal Plain counties of South Carolina

Water Well Database
Source: Department of Natural Resources
Telephone: 864-654-1671

www.edrnet.com

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

The Sanborn Library includes more than 1.2 million Sanborn fire insurance maps, which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ✔ Library of Congress
- ✔ University Publications of America
- ✔ EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

The Military Dept., State of SC (the client) is permitted to make up to THREE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

DOD: Consists of federally owned or administered lands, administered by the Department of

Defense, that have any area equal to or greater than 640 acres of the United States, Puerto Rico, and the U.S. Virgin Islands.

A review of the DOD list, as provided by EDR, and dated 12/31/2005 has revealed that there is 1 DOD site within approximately 1 mile of the target property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 06/30/2011

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 06/30/2011

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 02/25/2011
Date Data Arrived at EDR: 03/01/2011

Data Release Frequency: Varies

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 06/15/2011
Date Data Arrived at EDR: 07/07/2011

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

SHWS: Site Assessment Section Project List

State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.

Date of Government Version: 10/06/2011

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: Permitted Landfills List

Solid Waste Facilities/Landfill Sites. SWF/LF type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the state, these may be active or inactive facilities or open dumps that failed to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 10/06/2011

State and tribal institutional control / engineering control registries

RCR: Registry of Conditional Remedies
The Bureau of Land and Waste Management established this Registry to help monitor and maintain sites that have conditional remedies. A Conditional Remedy is an environmental remedy that includes certain qualifications. These qualifications are divided into two major categories: Remedies requiring Land Use Controls and Conditional No Further Actions.

Date of Government Version: 12/20/2011

State and tribal voluntary cleanup sites

VCP: Voluntary Cleanup Sites
Sites participating in the Voluntary Cleanup Program. Once staff and a non-responsible party have agreed upon an approved scope of work for a site investigation and/or remediation, the party enters into a voluntary cleanup contract. Staff oversees the cleanup efforts to ensure that activities are performed to our satisfaction. Upon completion of the negotiated work in the voluntary cleanup contract, the non-responsible party receives State Superfund liability protection.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

ALLSITES: Site Assessment & Remediation Public Record Database
The South Carolina Department of Health and Environmental Control is pleased to have the Public Record for your review. The purpose of this database is two-fold. First, it will provide to communities another form of notice of cleanup activity, allowing them to have more information about assessment and cleanup activities in their area and in the State. Second, it can assist those seeking to redevelop brownfield properties within South Carolina.

Other Ascertainable Records

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

HIST FTTS INSP: FIFRA/TSCA Tracking System Inspection & Enforcement Case Listing

A complete inspection and enforcement case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

SSTS: Section 7 Tracking Systems

Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

Date of Government Version: 12/31/2009

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 11/21/2011
Date Data Arrived at EDR: 11/22/2011

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: Rextag Strategies Corp.
Telephone: (281) 769-2247
U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Child Day Care List
Source: Department of Social Services
Telephone: 803-898-7345

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetlands Inventory

South Map:	33080-H7 CONGAREE, SC
Most Recent Revision:	1987

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

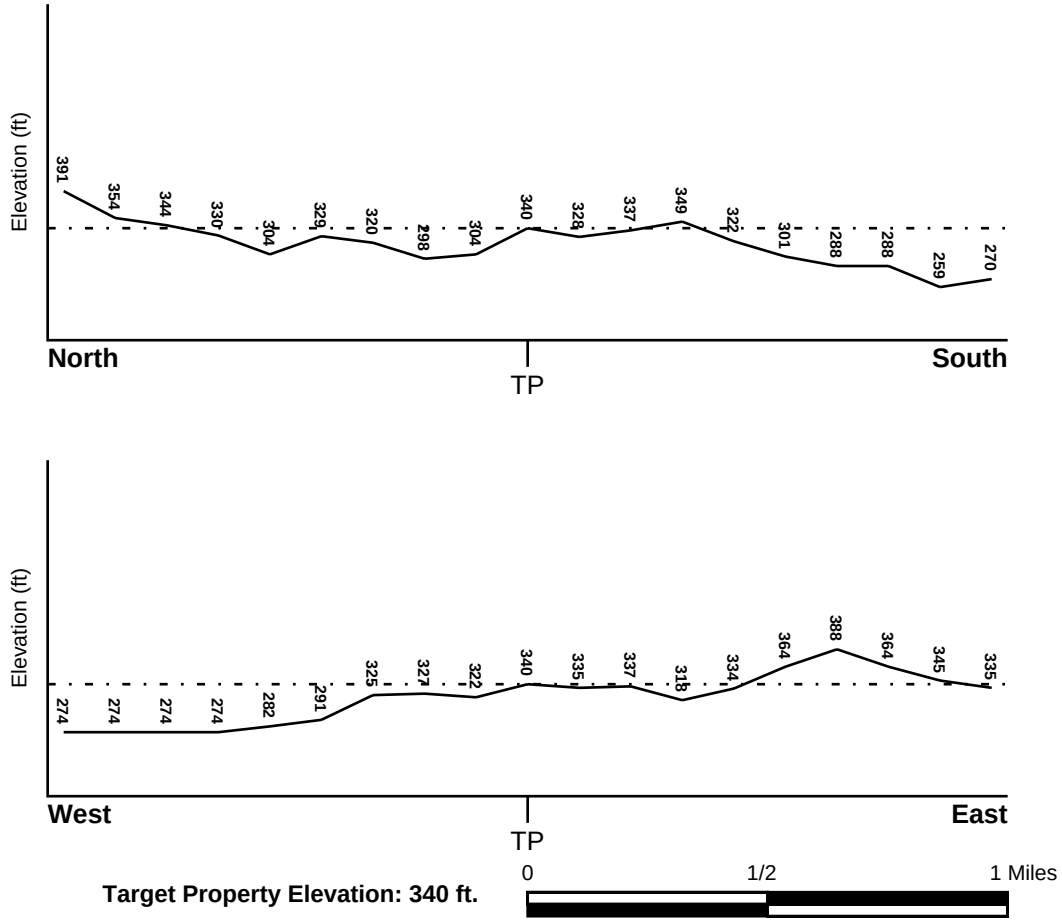
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General North

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
RICHLAND, SC	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 45079C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
MESSERS POND	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Lakeland

Soil Surface Texture: sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	29 inches	sand	Not reported	Not reported	Max: 141 Min: 42	Max: 6 Min: 4.5
2	29 inches	98 inches	sand	Not reported	Not reported	Max: 141 Min: 42	Max: 6 Min: 4.5

Soil Map ID: 2

Soil Component Name: Blanton

Soil Surface Texture: sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 122 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	9 inches	sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 14 Min: 4	Max: 5.5 Min: 4.5
2	9 inches	50 inches	sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 14 Min: 4	Max: 5.5 Min: 4.5
3	50 inches	96 inches	sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 14 Min: 4	Max: 5.5 Min: 4.5

Soil Map ID: 3

Soil Component Name: Ailey

Soil Surface Texture: loamy sand

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 1.4 Min: 0.42	Max: 5.5 Min: 4.5
2	29 inches	37 inches	sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 1.4 Min: 0.42	Max: 5.5 Min: 4.5
3	5 inches	29 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 1.4 Min: 0.42	Max: 5.5 Min: 4.5
4	37 inches	68 inches	sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 1.4 Min: 0.42	Max: 5.5 Min: 4.5
5	68 inches	81 inches	sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 1.4 Min: 0.42	Max: 5.5 Min: 4.5

Soil Map ID: 4

Soil Component Name: Johnston

Soil Surface Texture: loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Very poorly drained

Hydric Status: All hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	9 inches	loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 5.5 Min: 4.5
2	37 inches	66 inches	stratified sandy loam to fine sandy loam to sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 5.5 Min: 4.5
3	9 inches	37 inches	mucky loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 5.5 Min: 4.5

Soil Map ID: 5

Soil Component Name: Lakeland

Soil Surface Texture: sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetlands Inventory
Source: Department of Natural Resources
Telephone: 803-734-9494

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Natural Resources
Telephone: 803-734-6440
Water wells in the Coastal Plain counties of South Carolina

Water Well Database
Source: Department of Natural Resources
Telephone: 864-654-1671
A listing of water wells in the Piedmont (upstate) counties.

Appendix D

Interviews

Appendix D

Name: Lahiri Estaba, P.G.	
Title: Environmental Restoration Program (IRP) Manager	**Employer:** Engineering & Environment, Inc. Contractor for the US Army at Fort Jackson
Date: 2/29/12	**Method of Contact:** Personal Interview
Reason for Contact: Questions regarding contamination, past use, and UXO for project 515 Range Development Plan ECOP.	

- Mr. Estaba was asked about contamination in the areas of the proposed ranges, as well as past use and any other potential environmental concerns.
- He indicated the potential presence of UXO in all proposed locations and suggested contacting a range safety officer for more information.
- He was not aware of any contamination in the immediate area of the target locations, only SMU sites located at distances too far away to be of concern

Appendix D

Name: Linda A. Johnson	
Title: Environmental Compliance Tech	**Employer:** SCARNG
Date: 3/1/2012	**Method of Contact:** Personal Interview
Reason for Contact: Questions regarding hazardous materials, petroleum products, and other contamination for project 515 Range Development Plan ECOP.	

- Ms. Johnson was asked about known contamination, response actions, petroleum products, storage tanks, and any other potential contamination in the areas of the proposed ranges.
- She was unaware of any of the previously mentioned concerns, except for the SMUs also mentioned by Mr. Estaba, again too far to cause concern.

Appendix D

Name: Patrick Metts	
Title: NEPA Specialist	**Employer:** Engineering and Environment, Inc. Contractor for the US Army at Fort Jackson
Date: 2/29/2012	**Method of Contact:** Personal Interview
Reason for Contact: Questions concerning project 515 Range Development Plan ECOP.	

- Mr. Metts was asked for any previously completed ECOP documents for existing ranges in the area. He was not aware of any such documents.

Appendix E

Orphan Sites

Appendix E

MPMG, MRF, and 10/25m Zero Range Orphan Sites

Jacksons - RT 1 PO Box 241 A Columbia, SC 29203

This site's exact location could not be found. There are 3 underground storage tanks at this facility. None of which are reported to be leaking, so this site is deemed not to pose a significant threat.

SC School Bus Depot - RT 5 PO Box 13 Hwy 21 N

This site's exact location could not be found, however Hwy 21 is approximately 15 miles from the target site at its closest point. Although there is one underground storage tank on the property, its distance from the target site prevents it from posing a threat.

Pontiac Precision Bombing Range, Columbia Army Air Base

This site is listed as a hazardous waste site due to its past use as a bombing range and the potential for UXOs. A housing development has since been created on this property which is known as Summit Subdivision. It is located in the Sand Hills area, approximately 15 miles from the target site and therefore poses no significant threat.

VCC-GLOBE - NE corner of Catawba & Gadsden

This site is located approximately 15 miles from the target site. It is listed as a hazardous waste site, but its distance from the target site prevents it from posing a significant threat.

GASLO 745 - 2500 4 Decker RD

This site is located on Decker Rd, approximately 13 miles from the target site. There are 3 underground storage tanks on the property, and there have been leaks reported. Due to distance from the target site, this facility is not deemed a significant threat.

Newell Rubbermaid - 10700 Farrow Rd

This site is located on Farrow Rd. approximately 14 miles away from the target site. It is recognized as a hazardous waste site, and has received notices of violations. This facility's distance from the target site prevents it from being a significant threat to the target properties.

Undeveloped Property Adjacent to Intersection of Leaning Tree Rd and Olde Still Rd

This property is located approximately 8 miles from the target site, and is listed as a state hazardous waste site. Its distance from the target site prevents it from posing a significant threat.

Diamont Boart America - Two Notch Rd

This site is located approximately 10 miles from the target site and is listed as a state hazardous waste site. Its distance from the target site prevents it from being a threat.

Youngs 24 – Pinestraw Lane

This site's exact location could not be determined; however Pinestraw Lane is located approximately 25 miles from the target site. There are 2 underground storage tanks at the facility, and leaks have been reported. The site's distance from the target site prevents it from posing a threat to the target properties.

Gulf Service Station 24225 – Piney Grove Rd @ I26

This site is located approximately 20 miles from the target site. The site has 5 underground storage tanks and has reported leaks, but its distance from the target properties prevents it from posing a threat.

New China Restaurant – 3530 River Drive at Sunset Blvd

This site is located approximately 20 miles from the target site. There are 4 underground storage tanks on site and leaks have been reported, but its distance from the target site prevents it from posing a significant threat to the target properties.

SC DHEC Maintenance – PO Box 123 State Park

The exact location of this site could not be determined, but it is approximated at 15 miles from the target site. There is one underground storage tank indicated at this location, but it is not deemed to pose a significant threat to the target properties due to its distance from them.

Cooper Tools – Near Intersection of US 1 and Sparkleberry

This site is located approximately 20 miles from the target site. It is listed in a local unique database. Distance from target properties prevents this site from posing a threat.

Shoothouse Orphan Sites

Jacksons - RT 1 PO Box 241 A Columbia, SC 29203

This site's exact location could not be found. There are 3 underground storage tanks at this facility. None of which are reported to be leaking, so this site is deemed not to pose a significant threat.

SC School Bus Depot - RT 5 PO Box 13 Hwy 21 N

This site's exact location could not be found, however Hwy 21 is approximately 15 miles from the target site at its closest point. Although there is one underground storage tank on the property, its distance from the target site prevents it from posing a threat.

Pontiac Precision Bombing Range, Columbia Army Air Base

This site is listed as a hazardous waste site due to its past use as a bombing range and the potential for UXOs. A housing development has since been created on this property which is

known as Summit Subdivision. It is located in the Sand Hills area, approximately 15 miles from the target site and therefore poses no significant threat.

VCC-GLOBE - NE corner of Catawba & Gadsden

This site is located approximately 15 miles from the target site. It is listed as a hazardous waste site, but its distance from the target site prevents it from posing a significant threat.

GASLO 745 - 2500 4 Decker RD

This site is located on Decker Rd, approximately 13 miles from the target site. There are 3 underground storage tanks on the property, and there have been leaks reported. Due to distance from the target site, this facility is not deemed a significant threat.

Newell Rubbermaid - 10700 Farrow Rd

This site is located on Farrow Rd. approximately 14 miles away from the target site. It is recognized as a hazardous waste site, and has received notices of violations. This facility's distance from the target site prevents it from being a significant threat to the target properties.

Undeveloped Property Adjacent to Intersection of Leaning Tree Rd and Olde Still Rd

This property is located approximately 8 miles from the target site, and is listed as a state hazardous waste site. Its distance from the target site prevents it from posing a significant threat.

Diamont Boart America - Two Notch Rd

This site is located approximately 10 miles from the target site and is listed as a state hazardous waste site. Its distance from the target site prevents it from being a threat.

Youngs 24 – Pinestraw Lane

This site's exact location could not be determined; however Pinestraw Lane is located approximately 25 miles from the target site. There are 2 underground storage tanks at the facility, and leaks have been reported. The site's distance from the target site prevents it from posing a threat to the target properties.

Gulf Service Station 24225 – Piney Grove Rd @ I26

This site is located approximately 20 miles from the target site. The site has 5 underground storage tanks and has reported leaks, but its distance from the target properties prevents it from posing a threat.

New China Restaurant – 3530 River Drive at Sunset Blvd

This site is located approximately 20 miles from the target site. There are 4 underground storage tanks on site and leaks have been reported, but its distance from the target site prevents it from posing a significant threat to the target properties.

SC DHEC Maintenance – PO Box 123 State Park

The exact location of this site could not be determined, but it is approximated at 15 miles from the target site. There is one underground storage tank indicated at this location, but it is not deemed to pose a significant threat to the target properties due to its distance from them.

Cooper Tools – Near Intersection of US 1 and Sparkleberry

This site is located approximately 20 miles from the target site. It is listed in a local unique database. Distance from target properties prevents this site from posing a threat.

Weeks Liquid Fertilizer Inc. – County Road #769

This site is located approximately 5 miles from the target property. It is listed as a hazardous waste site, but distance prevents it from posing a threat to the target property.

Midway Grocery – Hwy 6

This site is located approximately10 miles from the target property. It is listed as having underground storage tanks on site, but will not pose a threat to the target property due to distance.

Old Eastover Dump – Joe Champey Rd

This site is located approximately 14 miles from the target property. It is listed as a state hazardous waste site, however its distance from the target property prevents it from posing a threat.

MCI LLC-EASTSC – 2960 Old Eastover Dr.

This site is located approximately 15 miles from the target property. There are 2 underground storage tanks reported on the property, however there have been no leaks reported. Distance from the target property prevents this property from posing a threat.

Re: United States (U.S.) Army Fiscal Year (FY) 18-22 Operational Range Assessment (ORA) Cycle Advanced Assessment Report–Fort Jackson / McCrady Training Center, South Carolina

Dear Mr. Perry and Mr. Cook,

EA Engineering, Science, and Technology, Inc., PBC is pleased to provide this *Draft Operational Range Assessment Advanced Assessment Report* for Fort Jackson / McCrady Training Center, South Carolina. This document is also being provided to the United States Army Environmental Command (USAEC) and the Army Public Health Center (APHC) for their review and comment.

Please provide your comments on this document to me by 23 May 2023 so that we can prepare a response to comments package and incorporate those changes into a subsequent Final Report.

If you have any questions concerning the Draft Advanced Assessment, please do not hesitate to contact me using the information provided below.

Regards,

Kevin Sharpe, Assessment Team Leader

Executive Summary

The Army Operational Range Assessment (ORA) effort was developed to address Department of Defense (DoD) requirements detailed in DoD Directive 4715.11 (10 May 2004) and DoD Instruction (DoDI) 4715.14 (15 November 2018). These documents require all Services to identify operational ranges, identify munitions constituents (MC) contained in military munitions used or being used on operational ranges, and assess whether MC from military munitions used on operational ranges are migrating to off-range areas at levels posing an unacceptable risk to off-range human health and/or the environment. The overall objective of the ORA is to assess operational ranges/range complexes at Fort Jackson/McCrady Training Center to determine if an off-range MC release or substantial threat of an off-range MC release exists; if an off-range MC release exists, does it exceed an applicable regulatory reporting standard; and if an MC release or substantial threat of a release exists, determine whether it creates a potentially unacceptable risk to off-range human health or the environment. The Army conducted an ORA Advanced Assessment at Fort Jackson/McCrady Training Center to achieve this objective and comply with the DoDI requirement to regularly reassess the determination of previous assessments.

The protocols for the execution of the ORA Advanced Assessments for the United States (U.S.) Army are detailed in the Operational Range Assessment Program Phase II Protocol (U.S. Army Center for Health Promotion and Preventive Medicine 2009). The overall strategy for conducting ORA Advanced Assessments is based on the application of the U.S. Environmental Protection Agency's (USEPA) systematic planning or data quality objective (DQO) process. The application of the DQO process is required by DoDI 4715.14, "Operational Range Assessments" (15 November 2018). The DQO process provides a sequence of logical steps to address the sampling rationale, decision criteria, and approaches in selecting a sampling design. The DQO planning process is an iterative process that assists in determining the appropriate type, quantity, and quality of environmental data necessary for making decisions that are technically sound and defensible.

As identified during the DQO process for the ORA Advanced Assessments, the project goal is to determine whether concentrations of MC of concern (MCOC) in surface water systems and/or groundwater are migrating from the operational range and if those concentrations present an unacceptable risk to human health and/or the environment off-range. The Advanced Assessment can address the study goal through an update of the Conceptual Site Model (CSM) from previous assessments by collection of additional data, modeling of MC concentrations, or the analysis and screening of surface water, sediment, benthic macroinvertebrate, and/or groundwater samples collected. The first step in addressing the study goal is to review the CSMs developed during the previous investigations.

The 2008 Phase I studies evaluated Fort Jackson and McCrady Training Center under two separate investigations. At McCrady Training Center, the 2008 Phase I ORA evaluated 62 operational ranges, including 2 firing ranges, 3 small arms ranges, and 57 training areas, totaling approximately 14,895 acres. The ORA concluded that 14 ranges were categorized as Unlikely that a source/receptor interaction could occur because no potential source/pathway receptor interactions were identified. The other 48 ranges at McCrady Training Center were categorized as Inconclusive, including firing ranges, small arms ranges, and training areas.

The 2008 Phase I ORA for Fort Jackson evaluated 104 operational range areas, including 8 firing ranges, 19 small arms ranges, 75 training areas, and 2 impact areas, totaling 29,716.58 acres. The ORA concluded that 53 ranges at Fort Jackson were categorized as Unlikely that a source/receptor interaction could occur because no potential source/pathway receptor interactions were identified. The ORA concluded that 51 ranges, including impact areas, medium and large caliber firing ranges, small arms ranges, and training

areas that either contain artillery or mortar firing points or known or suspected dudded areas or have received heavy historical munitions usage, were categorized as Inconclusive.

The 2014 Phase II ORA evaluated both Fort Jackson and McCrady Training Center in a combined quantitative assessment, as they are adjoining installations occupying a total of 51,961 acres and totaling 163 operational range areas between both installations. The Phase II multi-season sampling event was conducted from 2009 to 2013. The investigation included surface water and sediment samples from five downstream and three reference locations within Colonels Creek Watershed, Cedar Creek Watershed, and Gills Creek Watershed. Surface water was analyzed for metals, propellants, and explosives and sediment was analyzed for metals and explosives. Additionally, benthic macroinvertebrate surveys were conducted to characterize overall stream health. Surface water, sediment, and benthic macroinvertebrate sampling data indicated MCOC were not migrating off-range via Colonels Creek or Cedar Creek. Because Cedar Creek surface water and sediment sampling data were considered conservatively representative of Mill Creek conditions, these data also indicate MCOC were not likely migrating off-range via Mill Creek. Surface water and sediment sampling data from the Gills Creek watershed included lead and copper concentrations exceeding project action limits (PALs). Based on these results, a Screening Level Ecological Risk Assessment (SLERA) was performed to better assess the conditions. The SLERA performed on the results from Gills Creek indicated that the potential for adverse ecological health effects from exposure to sediment in Gills Creek at the operational range boundary is likely low. However, based on the low pH in surface water and low total organic carbon in sediment, these metals may become mobile and bioavailable.

Groundwater sample results showed that concentrations of cyclotrimethylenetrinitramine (RDX) were present in groundwater and had migrated to Cedar Creek monitoring wells near the operational range and installation boundary, upgradient of off-range wells used for drinking water. It could not be determined if RDX had migrated off the operational range area. A separate subsequent investigation outside of ORA was launched under an environmental program and this study showed off-post migration.

The 2023 Advanced Assessment for Fort Jackson/McCrady Training Center refined the CSM through the collection of updated source, pathway, and receptor data and included a review of existing analytical results from previous investigations. Based on recent geographic information system data, Fort Jackson/McCrady Training Center are composed of 148 operational ranges covering 51,322.78 acres, which include 55 maneuver/training areas, 56 firing ranges, 4 dudded impact areas, 15 non-dudded impact areas, and 18 historic impact areas. Additionally, there are approximately 7,591 acres of non-operational cantonment area. A decrease in acreage from the Phase II Assessment to the Advanced assessment results from the exclusion of the area including the Fort Jackson National Cemetery, located north of the installation boundary.

Surface water and sediment samples were collected under the Advanced Assessment to address data gaps identified in the updated CSM. Surface water was analyzed for dissolved metals, explosives, perchlorate, and Biotic Ligand Model parameters. Sediment was analyzed for metals, explosives, and simultaneously extracted metals/acid volatile sulfide. As groundwater in Cedar Creek is being addressed under the Feasibility Study, additional sampling of groundwater was not conducted and existing data was reviewed.

Sampling of surface water and sediment consisted of a single grab sample at the six downstream locations in the Fort Jackson Mill Creek Watershed (SWMC1, SWMC2, SWMC3), the Colonels Creek Watershed (SWCC3, SWCC4) which runs through both Fort Jackson and McCrady Training Center, and Jumping Run Creek Watershed (SWJC1) in McCrady Training Center and one reference location upstream in Fort Jackson from Colonels Creek (SWCC2). Colonels Creek was used as a worst-case indicator to represent Cedar Creek and Gills Creek. Due to a combination of higher detection limits associated with the analytical

method (USEPA SW6020A), low water hardness, and laboratory blank metals contamination, the majority of surface water metals results were qualified as non-detect. Therefore, the potential migration of metals MCOC via surface water within the Upper Colonels Creek, and Lower Colonels Creek (including Jumping Run Creek) was determined to be Inconclusive. The surface water metals results that did not qualify as non-detect included lead detections that exceeded the state specific freshwater ecological regulatory level at SWMC2 and SWMC3; therefore, the Mill Creek watershed was determined to be Referred. There were no detections of explosives or perchlorate in surface water. Sediment results indicated there is no migration of metals from source areas at Fort Jackson/McCrady Training Center and no detections exceeded screening values. No explosives were detected in sediment.

The worst-case scenario for groundwater was explosives along the south-central boundary, and that assessment, originally part of the last ORA study, is now being handled under another environmental program. With the site being characterized, the attention has turned to a Feasibility Study of a residual subsurface soil source of RDX. The Proposed Plan for remedial actions at the site is being finalized.

Based on the Inconclusive results of the surface water samples for metals MCOC, this Advanced Assessment recommends that future ORA assessments analyze surface water at Fort Jackson/McCrady Training Center using USEPA 1638 (trace metals analysis) to accommodate for low water hardness and follow a multi-seasonal sampling approach to provide a more robust dataset that benefits from a statistical analysis of the data results. Therefore, the source area ranges, consisting of 53 firing ranges, 4 dudded impact areas, 14 non-dudded impact areas, 39 maneuver and training areas, and 16 historic impact areas, totaling 46,950.56 acres, should be re-categorized as Inconclusive. The remaining ranges, including the entirety or a portion of 3 firing ranges, 1 non-dudded impact area, 2 historical impact areas, and 16 maneuver and training areas within the Mill Creek Watershed, totaling 4,372.22 acres, should be re-categorized as Referred due to the potential migration of lead MC off-range in surface water at concentrations exceeding screening levels that may potentially pose an unacceptable risk to off-range ecological and human receptors.

All of Fort Jackson/McCrady Training Center's operational ranges should be included in the FY23–27 cycle of ORAs to meet DoDI requirements. **Table ES-3** and **Figure ES-1** summarize the Advanced Assessment findings.

435 **Table ES-3: Advanced Assessment Conclusions Summary**

Category	Total Number of Ranges and Acreage	Source(s)	Pathway(s)	Human Receptors	Ecological Receptors	Conclusions and Rationale
Inconclusive; 46,950.56 acres	53 firing ranges, 4 dudded impact areas, 14 non-dudded impact areas, 39 maneuver and training areas, and 16 historic impact areas	Maneuver training areas, live-fire ranges, impact areas	Surface water-Colonels Creek, Cedar Creek, and Gills Creek Groundwater-Middendorf Aquifer	Recreation users of Weston Lake and users of the recreational facilities at Weston Lake.	Threatened and endangered species and sensitive environments downstream of operational areas.	Undetermined potential of metals in surface water. All Inconclusive ranges should be included in the FY23–27 cycle of ORAs, to meet DoDI requirements.
Referred; 4,372.22 acres	3 firing ranges, 1 non-dudded impact area, 2 historical impact areas, and 16 maneuver and training areas	Maneuver training areas, live-fire ranges, impact areas	Mill Creek Watershed	Recreational users of Old Heises Pond.		MC (lead) associated with the southern portion of the Mill Creek Watershed and are potentially migrating off-range via surface water at levels that pose an unacceptable risk to off-range human and/or ecological receptors. For sediment no MC were determined to be migrating at levels that pose an unacceptable risk to off-range human and/or ecological receptors. The Army and Fort Jackson will determine appropriate further analysis to better characterize the risk posed by these ranges and monitor MC migration off-range.

1.0 Introduction

Under contract to the United States (U.S.) Army Environmental Command (USAEC) (Contract No. W91ZLK-13-D-0004-0016), EA Engineering, Science, and Technology, Inc., PBC (EA) conducted the Operational Range Assessment (ORA) Advanced Assessment at Fort Jackson/McCrady Training Center, South Carolina, in 2023.

1.1 Project Purpose and Overview

The Army ORA effort was developed to address Department of Defense (DoD) requirements detailed in DoD Directive (DoDD) 4715.11 (10 May 2004) and DoD Instruction (DoDI) 4715.14 (15 November 2018). These documents require all Services to identify operational ranges, identify munitions constituents (MC) contained in military munitions used or being used on operational ranges, and assess whether MC from military munitions used on operational ranges are migrating to off-range areas at levels posing an unacceptable risk to off-range human health and/or the environment. The overall objective of the ORA is to assess operational ranges/range complexes at Fort Jackson/McCrady Training Center to determine if an off-range MC release or substantial threat of an off-range MC release exists; if an off-range MC release exists, does it exceed an applicable regulatory reporting standard; and if an MC release or substantial threat of a release exists, determine whether it creates a potentially unacceptable risk to off-range human health or the environment.

The protocols for the execution of the ORA Advanced Assessments for the U.S. Army are detailed in the Operational Range Assessment Program (ORAP) Phase II Protocol (U.S. Army Center for Health Promotion and Preventive Medicine [USACHPPM] 2009). The overall strategy for conducting ORA Advanced Assessments is based on the application of the U.S. Environmental Protection Agency's (USEPA's) systematic planning or data quality objective (DQO) process. The application of the DQO process is required by DoDI 4715.14, "Operational Range Assessments" (15 November 2018). The DQO process provides a sequence of logical steps to address the sampling rationale, decision criteria, and approaches in selecting a sampling design. The DQO planning process is an iterative process that assists in determining the appropriate type, quantity, and quality of environmental data necessary for making decisions that are technically sound and defensible.

As identified during the DQO process for the ORA Advanced Assessments, the project goal is to determine whether concentrations of MC of concern (MCOC) in surface water systems and/or groundwater are migrating from the operational range and if those concentrations present an unacceptable risk to human health and/or the environment off-range.

This Advanced Assessment addressed the study goal through the collection of updated source, pathway, and receptor data. The data were used to update the Conceptual Site Model (CSM) through the analysis and screening of surface water and sediment samples collected at Fort Jackson/McCrady Training Center.

This report summarizes the findings from the previous ORAs, describes the Advanced Assessment data collection activities from March 2023, presents the Advanced Assessment data interpretation and CSM refinements, and provides conclusions and recommendations for Fort Jackson/McCrady Training Center.

1.2 Operational Range Assessment Program Scope and Drivers

The ORA is being implemented to fulfill requirements contained implicitly and explicitly in the following documents:

- DoDD 4715.11, Environmental and Explosives Safety Management on Operational Ranges Within the United States (10 May 2004)

- DoDI 4715.14, *Operational Range Assessments* (15 November 2018). Reissues and cancels DoDI 4715.14 (30 November 2005).

The DoDD and DoDI require the U.S. Army maintain an operational range inventory and evaluate the potential for off-range migration of MC. The DoDI identifies MC to be evaluated and lays out a scientifically sound process for assessing and presorting potential off-range environmental impacts of munitions used on operational ranges. In particular, the DoDI requires the DoD components to respond to a release or substantial threat of release of MCOC from an operational range area to an off-range area, when such a release poses an unacceptable risk to human health or the environment.

This current cycle of ORAs is being conducted as either a Basic or an Advanced Assessment to meet the DoD requirement for installations to be re-assessed on a recurring basis. Both types of assessments involve the compilation and evaluation of readily available information to construct a CSM of each range or range complex; an Advanced Assessment differs from a Basic Assessment in that media samples are collected to close data gaps in the CSM related to potential MC migration and risk.

1.3 Work Authority

The Deputy Assistant Secretary of the Army (Environment, Safety, and Occupational Health) is the U.S. Army proponent for the ORAs. The Deputy Chief of Staff, G-9, Installations (formerly Assistant Chief of Staff for Installation Management) has designated USAEC to serve as program manager for the Active Army and Army Reserve components assessment execution. USAEC is supported by the U.S. Army Public Health Center to provide programmatic technical oversight.

1.4 Previous Operational Range Assessments

Active Army and Army Reserve Installations underwent initial Qualitative (Phase I) Assessments between 2005 and 2009. As a result of the Phase I Assessments, installations either received a Quantitative (Phase II) Assessment, which included sampling, or a "Periodic Review" between 2010 and 2017. The Periodic Reviews meet the DoD requirements for installations to be re-assessed on a recurring basis and resulted in Addendums to the ORAP Phase I Reports.

Based upon the review of readily available information evaluated during the previous ORA process, the ranges were placed into either the Unlikely or Referred category based on whether unacceptable risk to human health or the environment was identified:

Unlikely—Operational range areas categorized as "Unlikely" are those where there is sufficient evidence to show that there are no known releases or source-receptor interactions that could present an unacceptable risk to human health or the environment, based on a review of the information available. No further action needs to be taken at this time and the site has been placed into an ORA periodic review cycle.

Referred—Operational range areas categorized as "Referred" are those with compelling evidence (e.g., sampling data) to indicate the presence of an off-range release that potentially poses an unacceptable risk to human health or the environment.

1.5 Report Organization

This Advanced Assessment Report has been developed in accordance with the USACHPPM Army ORAP Phase II Assessment Protocol (USACHPPM 2009) and includes the following sections:

- *Section 1.0: Introduction* provides an introduction to ORA and discusses the purpose, project reference, work authority, and report organization.
- *Section 2.0: Installation Overview* summarizes the site description, site history, physical features, and previous ORA investigations and CSM.
- *Section 3.0: Advanced Assessment* details the Advanced Assessment and CSM.
- *Section 4.0: Methodology* describes the methodologies employed for sampling and analysis of the surface water system.
- *Section 5.0: Advanced Assessment Results and Discussion* presents the results for the surface water system.
- *Section 6.0: Summary and Conclusions* includes a summary of the investigation's findings and the conclusions drawn from the findings.
- *Section 7.0: References* includes a list of all references used in preparing the ORA Advanced Assessment Report.
- A*ppendix A:* Contains the previous ORA Reports.
- *Appendix B:* Contains the various field forms from the Advanced Assessment including the field book, chain-of custody forms, and quality assurance (QA)/quality control (QC) forms.
- *Appendix C:* Contains the photographic log of field events.
- *Appendix D:* Contains the laboratory reports for surface water and sediment.
- *Appendix E:* Contains the data validation summaries for surface water and sediment data.
- *Appendix F:* Contains the analytical data tables for surface water and sediment.

2.0 Installation Overview

This section summarizes the installation layout and history and describes the previous ORAs. Additional information regarding munitions use and physical characteristics can be found in (*Draft Final Operational Range Assessment Program Phase I Qualitative Assessment Report, Fort Jackson, South Carolina* (Malcolm Pirnie 2008a), *Draft Final Operational Range Assessment Program Phase I Qualitative Assessment Report, McCrady Training Center, South Carolina* (Malcolm Pirnie 2008b), and *Final Report Operational Range Phase II Assessment, U.S. Army Garrison Fort Jackson and McCrady Training Center, South Carolina* (PIKA-Pirnie Joint Venture, LLC 2014) (**Appendix A**).

2.1 Installation Background

Fort Jackson and McCrady Training Center are adjoining installations, together occupying approximately 51,322.78 acres in Richland County, South Carolina (**Figure 2-1**). The South Carolina Army National Guard (SCARNG) holds a nonexclusive license for training operations on approximately 15,267 acres of the eastern portion of Fort Jackson, known as McCrady Training Center. For purposes of the ORA, both installations will be assessed together. Fort Jackson (as well as the portion now leased by SCARNG) has served as a military training facility since 1917. During World War II, Fort Jackson became a permanent military installation used primarily for infantry training. The current and primary mission of Fort Jackson is to train initial entry recruits for duty as soldiers for Army units. To support this mission, Fort Jackson currently houses Army training brigades and serves as a reception station that processes newly inducted and prior service personnel forwarded to the installation from recruiting and induction stations. Fort Jackson is the largest and most active initial entry center in the U.S. Army, providing training to approximately 25 percent of the men and women who enter the service each year. The installation instructs approximately 55,000 to 65,000 soldiers each year, including participants in Basic Combat Training, Advanced Individual Training, and many professional schools. McCrady Training Center is the SCARNG's largest and most utilized training area, serving as the central point for state missions, while also supporting federal missions.

Fort Jackson and McCrady Training Center utilize 148 operational ranges covering 51,322.78 acres, which includes 55 maneuver/training areas, 56 firing ranges, 4 dudded impact areas, 15 non-dudded impact areas, and 18 historic impact areas (**Figure 2-2)**. The remaining 7,591 acres consist of the non-operational cantonment area. These ranges include live-fire weapons training, heavy and light maneuver exercises, dudded and non-dudded impact areas, and specialty training courses such as night-infiltration and military operations in urban terrain. There are two "wagon-wheel" configurations for the impact areas (that cover 9,645 acres), with the non-dudded impact areas largely surrounded by live-fire ranges to the north and south, and the dudded impact area receiving live-fire from ranges to the north and to the east on McCrady Training Center.

2.2 Physical Description

Gentle to moderately rolling, moderately dissected high plains occupy most of Fort Jackson/McCrady Training Center. These high plains are interrupted by the nearly flat alluvial plains of Gills, Cedar, and Colonels creeks and their tributaries and an irregularly distributed, gently sloping, low relief area in the central portion of the installation near the headwaters of Cedar Creek. The lowest elevation located in the high plains is adjacent to the alluvial plain of Colonels Creek in the eastern portion of the installation, and the highest elevation is in the west-central portion of the installation. The high sand content of the soils at Fort Jackson/McCrady Training Center promotes leaching of minerals, reduced water retention, and increases susceptibility to soil erosion.

Fort Jackson encompasses five watersheds or subwatersheds, that are drained by Colonels, Gills, Wildcat (or Lower Gills), Mill, and Cedar creeks. Additionally, there are 26 lakes, ponds, and impoundments on Fort Jackson/ McCrady Training Center. All creeks and streams leaving Fort Jackson/McCrady Training Center eventually flow into either the Wateree River or the Congaree River. These rivers meet about 16 miles southeast of Fort Jackson/McCrady Training Center, where they form the Santee River, the principal stream of the region. The Santee River continues in a southeasterly direction, eventually emptying into the Atlantic Ocean south of Georgetown, South Carolina.

The Middendorf Aquifer constitutes the primary aquifer used as a groundwater supply in the area including, and surrounding, Fort Jackson/McCrady Training Center. Within this region, the Middendorf Formation is entirely coincident with the Middendorf Aquifer. Half the wells occurring within the Middendorf Aquifer in Richland County are less than 100 feet deep. In the area directly to the south of Fort Jackson/McCrady Training Center the overwhelming majority of wells screened within the Middendorf Aquifer are screened above elevations of 175 feet above mean sea level. Wells located several miles north of the installation extract groundwater from bedrock aquifers, but very few wells on the installation or directly south of the installation extract groundwater from the bedrock aquifers due to the great depths (and therefore well installation expense) to bedrock.

Depths to water on-installation and immediately downgradient (to the south) generally range from two to 20 feet below ground surface within the cantonment area and directly adjacent to streams, up to a maximum depth of over 100 feet on highlands in interstream areas near the central part of the combined installations. The aquifer system in the region is described as stratified, consisting of shallow, intermediate, and deep groundwater flow systems. Fort Jackson/McCrady Training Center represent an important local and regional recharge area for the Middendorf Aquifer system. The majority of groundwater recharging the aquifer is expected to remain within the shallow and intermediate flow system and follow topography, ultimately discharging to local streams and rivers. A smaller proportion of recharge enters the deep groundwater flow system and discharges to regional discharge points. The Congaree and Wateree rivers to the south and east of the installation, respectively, have been identified as regional discharge points for the deep component of the groundwater system in Richland County.

2.3 Previous Investigations

Phase I

Fort Jackson and McCrady Center were evaluated under two separate Phase I ORAs.

At McCrady Training Center, the 2008 Phase I ORA evaluated 62 operational ranges, including 2 firing ranges, 3 small arms ranges, and 57 training areas, totaling approximately 14,895 acres. The ORA concluded that 14 ranges were categorized as Unlikely that a source/receptor interaction could occur because no potential source/pathway receptor interactions were identified. The other 48 ranges at McCrady Training Center were categorized as Inconclusive, including firing ranges, small arms ranges, and training areas.

The Phase I ORA for McCrady Training Center determined that training conducted at the Inconclusive ranges included the use of small, medium, and large caliber munitions, pyrotechnics/obscurants, and other munitions which constituted a source of MCOC that included metals, explosives, and perchlorate. The potential surface water system migration pathways from the inconclusive ranges originated from three primary watersheds: Colonels Creek Watershed, Gills Creek Watershed, and Cedar Creek Watershed. The potential groundwater migration pathways underlying the Inconclusive ranges included the Middendorf Aquifer, which was widely used for drinking water.

The 2008 Phase I ORA evaluated 104 operational range areas at Fort Jackson, including 8 firing ranges, 19 small arms ranges, 75 training areas, and 2 impact areas, totaling 29,716.58 acres. The ORA concluded that 53 ranges at Fort Jackson were categorized as Unlikely that a source/receptor interaction could occur because no potential source/pathway receptor interactions were identified. The ORA concluded that 51 ranges, including impact areas, medium and large caliber firing ranges, small arms ranges, and training areas that either contain artillery or mortar firing points or known or suspected dudded areas or have received heavy historical munitions usage, were categorized as Inconclusive.

The Phase I ORA for Fort Jackson determined that training conducted at the Inconclusive ranges included the use of small, medium, and large caliber munitions, pyrotechnics/obscurants, and other munitions which constituted a source of MCOC that included metals, explosives, and perchlorate. The potential surface water system migration pathways from the Inconclusive ranges originated from five primary watersheds: Colonels Creek Watershed, Gills Creek Watershed, Wildcat Creek Watershed, Mill Creek Watershed, and Cedar Creek Watershed. The potential groundwater migration pathways from the Inconclusive ranges included groundwater in the shallow, perched aquifer.

Phase II

The 2014 Phase II ORA evaluated both Fort Jackson and McCrady Training Center, as they are adjoining installations occupying a total of 51,961 acres. EA/Arcadis conducted the Phase II multi-season sampling event in 2009. Based on analytical data from those sampling events, an additional groundwater investigation was performed for groundwater in 2012–2013 and the report was issued the following year, in 2014. The investigations included surface water and sediment samples from five downstream and three reference locations within Colonels Creek Watershed, Cedar Creek Watershed, and Gills Creek Watershed. Surface water was analyzed for metals, propellants, and explosives and sediment was analyzed for metals and explosives (**Figure 2-3)**. Additionally, benthic macroinvertebrate surveys were conducted to characterize overall stream health.

The 2014 Phase II ORA was used to check the environmental impacts of operational range areas within the base boundaries. The assessment also studied the tendency of range-generated contaminants to migrate via surface pathways and groundwater transport. The findings of the assessment suggested that contaminants (explosives) generated from the operational ranges on-post had leached to groundwater and may be migrating off-post in the direction of private residences and privately-owned groundwater wells to the south. To the northwest, MC including copper and lead were found to be migrating in Gills Creek at unacceptable concentrations to the non-operational area and possibly to ecological receptors off-site past Boyden Arbor Pond.

A follow-on Phase II investigation for explosives in groundwater along the southern boundary included the installation of 16 pairs of shallow/deep monitoring wells and samples were collected from these well pairs along the southern installation boundary. Sample analyses from seven of the monitoring wells resulted in the detection of cyclotrimethylenetrinitramine (RDX), cyclotetramethylenete-tranitramine (HMX), 4,6-dinitrotoluene (DNT), 2,6-DNT, m-nitrotoluene, and o-nitrotoluene. A line of screen point borings was installed just north of the monitoring well pairs (excluding the East Impact 150 Area Operational Range) to assess vertical stratification of the explosives in groundwater. The 50 discrete groundwater samples resulted in the detection of HMX, RDX, and 2,6-DNT. Only 2,6-DNT was detected over the Tapwater Regional Screening Level value. The results indicated that MCOC were being transported from areas north of MW-8 through MW-11.

Based on the data collected for the initial 2009 sampling for surface water and groundwater and the 2012–2013 groundwater sampling, the following Phase II conclusions (**Figure 2-4)** were reached:

- Surface water, sediment, and benthic macroinvertebrate sampling data indicated MCOC were not migrating off-range via Colonels Creek or Cedar Creek. Because Cedar Creek surface water and sediment sampling data are considered conservatively representative of Mill Creek conditions, these data also indicated MCOC are not likely migrating off-range via Mill Creek.

- Surface water and sediment sampling data from the Gills Creek watershed included lead and copper concentrations exceeding project action limits (PALs). The Screening Level Ecological Risk Assessment (SLERA) performed on those results indicated that the potential for adverse ecological health effects from exposure to sediment in Gills Creek at the operational range boundary is likely low. However, based on the low pH in surface water and low total organic carbon in sediment, these metals may become mobile and bioavailable.

- Groundwater sample results showed that concentrations of RDX were present in groundwater and had migrated to monitoring wells near the operational range and installation boundary, upgradient of off-range wells used for drinking water. It was uncertain whether RDX had migrated off the operational range area.

Following the ORA Phase II study, there has been off-post sampling by the Army to assess explosives concentrations in off-post supply wells including many domestic well locations. As of November 2019, these activities have resulted in the Army collecting water samples from 194 wells near Fort Jackson, and installed drinking water treatment systems at 10 properties. A Feasibility Study was developed to assess long-term solutions and this focuses on screening technologies and evaluating alternatives to address RDX in groundwater above the Regional Screening Level. A Proposed Plan has been issued to clean up RDX using Alternative 4: Dynamic Groundwater Recirculation with Operation of Point of Use Treatment Systems and Monitoring. The public comment period for this document is currently underway.

Additionally, Fort Jackson recently completed additional sampling at Boyden Arbor Pond up on Gills Creek; however, during the Advanced Assessment investigation results were confirmed to be pending by environmental personnel.

3.0 Advanced Assessment

A CSM is developed to identify and describe the relationships between potential on-range sources of MC, possible off-range migration routes, and suspected off-range receptors. The CSM integrates and interprets information from a variety of resources to assess the potential existence of complete pathways and evaluate source-receptor interactions. CSM development is an iterative process and requires continual refinement. As knowledge and understanding of the site changes based on additional data collected, the CSM is revised to accurately represent current conditions (U.S. Army Corps of Engineers 2003).

As part of the Advanced Assessment, each component of the previous CSM (developed during the Phase II Investigation) was re-evaluated to determine if any changes to associated sources, pathways, or receptors have occurred. The updated CSM was then used to help determine whether potential MC was migrating off-range.

An Advanced Assessment was performed at Fort Jackson/McCrady Training Center to verify and update the installation's operational range inventory; ascertain the overall conditions of the operational range footprint; determine existing and potential best management practices; and determine if potential exists for MCOC to migrate to off-range areas and if such off-range migration poses an unacceptable risk to human health or the environment.

To accomplish the ORA objectives identified in Section 1.0, the following activities were conducted: a re-evaluation of previous investigations, data collection and document review (pertaining to each CSM component), interviews, a site reconnaissance, and the collection of confirmatory surface water and sediment samples. The initial site reconnaissance was conducted at Fort Jackson on 21–23 August 2018. An additional site reconnaissance was conducted on 9 March 2023 at McCrady Training Center, following the sampling event, which was conducted on 8 March 2023.

All information collected during the Advanced Assessment was used to develop an updated CSM **(Figure 3-1)**, which is described in more detail below.

3.1 Conceptual Site Model

Based on current geographic information system data, Fort Jackson/McCrady Training Center encompass 148 operational ranges covering 51,322.78 acres. The ranges within the combined installation areas include 55 maneuver/training areas, 56 firing ranges, 4 dudded impact areas, 15 non-dudded impact areas, and 18 historic impact areas. The remaining 7,591 acres (approximately) consist of the non-operational cantonment area.

Source

Munitions used at Fort Jackson/McCrady Training Center's operational ranges include small, medium, and large caliber; pyrotechnics and obscurants; and other weapon systems. Based on the types of munitions used and results of the Phase II ORA sampling efforts, metals (lead, antimony, copper, and zinc), explosives (HMX, RDX, trinitrotoluene, 2,4-DNT, 2,6-DNT, and pentaerythritol tetranitrate), perchlorate, and white phosphorus area identified as potential MCOC. The annual munitions usage at Fort Jackson and McCrady Training Center has fluctuated since the Phase II ORA data collection. Since 2014, the average annual munitions expenditures have increased at Fort Jackson, and on average, there has been a decrease in munition expenditures at McCrady Training Center. Consistent with Phase II, the majority of munitions expenditures are small arms at Fort Jackson/McCrady Training Center. The annual average of small arms munitions has increased, with approximately 28,428,085 live-fire small arms rounds expended annually at

Fort Jackson, and approximately 1,151,191 live-fire small arms rounds expended annually at McCrady Training Center. The southeast section of McCrady Training Center consists of a historical source area, due to the live-fire training range complex utilized in the 1950s–1960s, that was active until the 1960s. Within this southeast section, the orientation of shooting originated from the perimeter to the middle of the installation, from southeast to northwest, south to north, and north to south. Source areas at Fort Jackson include firing ranges, impact areas, non-dudded impact areas, maneuver and training areas, and historic impact areas. Notable ranges include Range 19, Range 18, and Range 17, which are located within the Mill Creek Watershed. Based on recent Range Facility Management Support System data, these ranges are used for large quantities of small caliber munition expenditures. **Table 3-1** summarizes munitions expenditures based on munitions category at Fort Jackson from 2002–2006 (data provided from the Phase II ORA), and from the previous assessment to the present (2014–2023). **Table 3-2** summarizes munitions expenditures based on caliber at McCrady Training Center from 2002–2006, and from the previous assessment to the present.

Table 3-1: Fort Jackson Total Munition Expenditure Summary

Munition Category	Phase II (2002-2006)	Advanced Assessment (2006-2023)[a]
Large Caliber	218	8,039
Large Caliber Practice	0	11,427
Medium Caliber	40,000	97,547
Medium Caliber Practice	80,000	1,493,541
Small Caliber	14,241,400	454,849,352
Small Caliber Practice	569,000	20,223,546
Pyrotechnic/Obscurant	6,731	102,160
Other	42,050	1,205,652
Other Practice	96,080	4,435,450
Non-lethal Round	0	1,357,445
Total	15,357,000[b]	483,784,176

Notes:
(a) The previous assessment evaluated data from 2002–2006. The munitions data evaluated for the Advanced ORA Assessment includes data from 2006- March 2023.
(b) The previous report munitions total also accounts for unknown munition expenditures.

Table 3-2: McCrady Training Center Total Munition Expenditure Summary

Munition Category	Phase II (2002-2006)	Advanced Assessment (2006-2023)[a]
Large Caliber	1,677	4,560
Large Caliber Practice	0	62
Medium Caliber	65,000	15,202
Medium Caliber Practice	2,400	233,509
Small Caliber	1,896,000	18,419,061
Small Caliber Practice	4,430	97,485
Pyrotechnic/Obscurant	95	13,599
Other	3,830	168,352
Other Practice	0	183
Non-lethal Round	0	2,260
Total	17,335,000[b]	18,954,273

Notes:
(a) The previous assessment evaluated data from 2002–2006. The munitions data evaluated for the Advanced ORA Assessment includes data from 2006- March 2023.
(b) The previous report munitions total also accounts for unknown munition expenditures.

Pathway

Fort Jackson and McCrady Training Center are drained by three major surface water drainage basins including Colonels Creek, Cedar Creek, and Gills Creek. Colonels Creek includes Jumping Run Creek and drains the eastern portion of the combined installation boundary, with flow entering through the eastern corner of Fort Jackson and leaving through the eastern corner of McCrady Training Center. Cedar Creek includes Weston Lake at the south-central installation boundary. Gills Creek watershed drains most of the western portion of Fort Jackson with the exception of Mill Creek on the southwest side. In the cantonment area, Wildcat Creek contributes to the lower part of Gills Creek.

During the ORA Phase II, eight locations were sampled from three watersheds, including two locations in Colonels Creek (including Jumping Run Creek), two locations in Cedar Creek (which includes Weston Lake), and four locations in Gills Creek. Samples were analyzed and comparisons were then made to screening criteria that indicated that there were no issues associated with surface water and sediment concentrations in the Cedar or Colonels Creek watersheds. Gills Creek had surface water and sediment concentrations above screening criteria and additional consideration was given to these concentrations in a SLERA.

Due to similar source, pathway, and receptor characteristics, the Cedar Creek watershed was chosen as the primary proxy for the Mill Creek surface water system in the Phase II Assessment.

Based on the results of a SLERA for Gills Creek, there was a concern about lead and copper in the surface water and sediment. A potential for adverse health effects in aquatic life in surface water was recommended to be assessed farther downstream of Boyden Arbor Pond at the installation boundary. The extent to which sediment may be altered during migration downstream of Boyden Arbor Pond is unknown (based on a possible change in acceptable concentrations due to low pH in surface water and low TOC in sediment) and it was recommended that further assessment may be warranted for those reasons.

With plans for sampling in Gills Creek to be done under another environmental program, other sampling sites were considered for the ORAP sampling with the ultimate selection of: 1) Mill Creek for surface water and sediment since this water body was not previously sampled and, 2) Colonels Creek and Jumping Run to assess surface water and sediment concentrations leaving the installation along with allowing for definition of contributions from Fort Jackson and McCrady Training Center, respectively.

Groundwater below the combined installation boundary occurs within unconsolidated sediments and the underlying bedrock. Precipitation falling on ranges at Fort Jackson and McCrady Training Center may infiltrate through the vadose zone and enter the groundwater system. Most groundwater recharging the Middendorf Aquifer is expected to remain within the shallow and intermediate flow system and ultimately discharge to local streams and rivers. Within the Gills Creek Watershed this means that water will likely be discharged to Gills Creek before leaving the installation. This is similarly true for much of the operational range area lying within the Cedar Creek and Colonels Creek watersheds. However, the topography within the central and western portions of the combined installation is much more variable with topographically higher hills dissected by streams creating deeper valleys. Precipitation that infiltrates these higher areas farther from adjoining streams is more likely to enter the intermediate or deeper flow system and bypass lower order streams, especially during the dry season. The intermediate and deeper flow system ultimately discharges to larger order streams to the south and southwest of the installation.

The area south of the southern installation boundary is generally considered to be hydraulically downgradient of most of the operational range area. For the area located west of Weston Lake, groundwater is unlikely to be utilized for drinking water purposes because the area is connected to a municipal supply

system. Well logs obtained from Fort Jackson and the South Carolina Department of Natural Resources indicate that the aquifers to the south and southeast of the installations are utilized for drinking water. Numerous groundwater supply wells are utilized to supply recreational facilities at Weston Lake. Additionally, numerous residential drinking water wells and larger supply wells were identified in the area south of the operational range area and to the east of Weston Lake. The overwhelming majority of wells screened within the Middendorf Aquifer are screened above elevations of 175 feet above mean sea level. This is particularly true for wells located within one to two miles of the installation boundary.

During the ORA Phase II, groundwater was sampled downgradient of a "Groundwater Assessment Area" that was meant to represent a worst-case scenario for MCOC presence. In 2009, there were groundwater samples collected and analyzed from intervals in 5 soil borings and also from 2 piezometers, and the Weston Lake supply well (all sampled once). In 2012-2013, there were samples collected and analyzed from 6 shallow/deep wells pairs (sampled 3 times over a year). Sample results indicated evidence of explosive concentrations.

Since the ORA Phase II, 194 groundwater samples have been collected from off-post residential wells along the southern installation boundary; RDX was detected in samples from 31 wells. As a result, the Army has treated the water or provided bottled water to residents. This additional on-and off-post sampling has led to the delineation of an explosives plume in groundwater.

Explosives in south-central groundwater are considered the worst-case scenario for the groundwater system in the Advanced Assessment. Since the recent sampling (and all of the off-post sampling) has been handled outside the ORA program, no groundwater sampling was planned for this Advanced Assessment.

Receptors

Receptors that are potentially affected by potential MCOC migrating off-range via surface water and/or groundwater pathways include human and ecological receptors. Aquifers to the south and southeast of the installations are utilized for drinking water and numerous groundwater supply wells are utilized to supply recreational facilities at Weston Lake. Additionally, numerous residential drinking water wells and larger supply wells were identified in the area south of the combined installations and to the east of Weston Lake. Additionally, the Fort Jackson Family and Morale, Welfare and Recreation division maintains recreational facilities on Weston Lake for military personnel and guests (U.S. Army Morale, Welfare and Recreation 2022). Other recreational users could be using the Old Heises Pond area in the Mill Creek Watershed. Twin Lakes is also in the Mill Creek Watershed but has been lower or emptied since historic flooding in 2015.

Potential ecological receptors affected via surface water include the sensitive wetland habitats downstream of operational areas and threatened and endangered species. There are approximately 5,250 acres of wetlands on Fort Jackson (U.S. Army Garrison Fort Jackson 2021). Fort Jackson provides habitat for one resident federally listed endangered animal species, the Red-cockaded Woodpecker (*Dryobates borealis*) (U.S. Army Garrison Fort Jackson 2021).

3.2 Advanced Assessment – Problem Definition

The Site-Specific Quality Assurance Project Plan (SSQAPP) contains detailed plans for execution of the Advanced Assessment at Fort Jackson/McCrady Training Center. The strategy for conducting the Advanced Assessment is based on the application of the USEPA systematic planning or DQO process. The DQO process provides an iterative sequence of seven logical steps to create a detailed technical approach. The following sections describe the major outputs of the site-specific application of the DQO process,

including the updated CSM and the detailed technical approach (i.e., Advanced Assessment) as documented in the Final SSQAPP for Fort Jackson/McCrady Training Center.

This Advanced Assessment was conducted to determine if there is a release or substantial threat of a release of MC from an operational range to an off-range area; if a release exists, determine whether the release of MC from an operational range to an off-range area exceeds an applicable regulatory reporting standard; and also determine whether the release or substantial threat of a release of MC from an operational range to an off-range area creates a potential unacceptable risk to human health or the environment. The Advanced Assessment was designed to answer the following questions:

- Is there a presence of MC in off-range media of concern (surface water or sediment)?
- Is there sufficient evidence present to show an off-range MC release or potential threat of off-range MC release exists?
- Does any release exceed an applicable regulatory reporting standard?
- Does any release create a potential unacceptable risk to human health or the environment?

If the answer to all these questions is "no" for a given range or study area, then the previous ORA finding remains accurate and the ranges are categorized as Unlikely. If the answer to any of the above questions is "yes" for a range or study area, then the MC release conditions may have changed to the point that the ranges/range complexes being re-evaluated should be recategorized as Inconclusive or Referred.

3.3 Surface Water System Investigation

3.3.1 Surface Water System Sampling Approach

Sampling locations for surface water and sediment were selected based on the updated CSM, which included a review of previous ORA Phase II sampling results, changes in range use and/or configuration, surface water hydrology, drainage area, and location of downstream human and/or ecological receptors. The sampling locations included are shown on **Figure 3-2**:

- **SWCC3** – Located at the off-range discharge point of the perennial Colonels Creek and draining all of Colonels Creek on Fort Jackson/ McCrady Training Center. Represents concentrations leaving the installation (combined flow from Fort Jackson/McCrady Training Center).
- **SWCC4** – Located at the off-range discharge point at the Fort Jackson/McCrady Training Center property boundary on perennial Colonels Creek. Represents upgradient concentrations for McCrady Training Center.
- **SWMC1** – Located in the upper reach of perennial Mill Creek receiving drainage from several live-fire ranges to the north. Represents concentrations leaving the source area to non-operational area prior to downstream ponds.
- **SWMC2** – Located in the central portion of perennial Mill Creek downstream of the ponded area within nonoperational area. Receives flow from the upper reach and discharge into the ponded area.

Represents concentrations leaving the ponded area, and upstream of possible baseflow from local landfills.

- **SWMC3** – Located in the lower portion of perennial Mill Creek at the installation boundary within nonoperational area. Receives flow from upgradient source areas and possibly baseflow from groundwater from local landfill sites. Represents concentrations leaving the installation.

- **SWJC1** – Located at the off-range discharge point at the McCrady Training Center property boundary for a 2-mile-long section of perennial Jumping Run Creek that flows along the southern boundary and associated Inconclusive range area. Represents concentrations leaving the installation.

- **SWCC2** – Located in a perennial tributary to Colonels Creek on the northeast side of the watershed that drains Unlikely range area. Represents background MCOC concentrations. The location will be used for Colonels Creek and for Mill Creek (which does not have a reference channel in its own watershed).

4.0 Methodology

Field activities were conducted in accordance with the Advanced Assessment SSQAPP (EA 2023). The SSQAPP was based on procedures in the U.S. Army ORAP Phase II Investigation Protocol (USACHPPM 2009); the structure of the USACHPPM Protocol and Work Plan follow the *Guidance on Systematic Planning Using the Data Quality Objectives Process* (USEPA 2006). Details on the sampling and analytical procedures are included in the SSQAPP along with the Accident Prevention Plan, which is included as an appendix to the SSQAPP. Additionally, all applicable sampling Standard Operating Procedures were followed for all sampling activities.

Samples collected during the Advanced Assessment were submitted to Katahdin Analytical Laboratories, DoD Environmental Laboratory Accreditation Program certified laboratories, under strict chain-of-custody procedures. Sample chain-of-custody forms are presented in **Appendix B**.

Safety procedures and unexploded ordnance (UXO) avoidance procedures were employed during all sampling activities in accordance with the Accident Prevention Plan. UXO avoidance procedures began prior to field activities with close coordination between EA and the installation Point of Contact. For ORA Advanced Assessment activities occurring on the installation, a UXO technician accompanied EA personnel and ensured that proper UXO avoidance procedures were followed for sampling events.

A photographic log of the field activities is presented in **Appendix C**.

4.1 Surface Water and Sediment Sampling Investigation

4.1.1 Sampling Events

During the Advanced Assessment, one round of surface water and one round of sediment sampling were conducted at six downstream locations and one reference location. Sediment samples were co-located with surface water samples. A summary of the samples collected is presented in **Table 4-1.**

Table 4-1: Surface Water System Sampling Summary

Media Sampled	Dry Season (March 2023) Clear Weather
Surface Water	One grab sample
Sediment	One composite sample

4.1.2 Surface Water Sample Collection Methods

All sampling events were carried out in accordance with the SSQAPP. The sampling approach followed a modified approach for perennial surface water systems based on the USACHPPM Protocol, without seasonal and storm sampling requirements. One grab surface water sample was collected during clear weather in one mobilization for a total of one surface water sample. One composite sediment sample was collected concurrently with the surface water sample. Samples were collected from seven locations, six downstream off-range discharge locations and one upstream reference location.

Surface water samples were collected using a peristaltic pump, peristaltic tubing, and a sample bottle. Because these grab samples were manually collected, the suction line was not secured on the stream bank or bottom. Instead, it was secured to a PVC pipe and lowered into the water (approximately two-thirds of

the stream depth). Once lowered to the desired depth, approximately 2 liters of water were transferred into laboratory-supplied containers. In addition to the native sample, the team collected the QA/QC samples associated with the specific location.

Field measurements of pH, temperature, dissolved oxygen, turbidity, specific conductivity, and oxidation-reduction potential were made during the sampling event.

4.1.3 Sediment Sample Collection Methods

Sediment samples consisted of 10 subsamples taken from various areas of the wetted perimeter of the stream. Sediment samples were collected in shallow surface water locations using a new disposable plastic scoop and bowl liner.

The sediment sampling procedure was as follows:

- The individual performing the sampling donned sterile latex gloves, obtained a clean liner/plastic bag, and obtained a new disposable plastic scoop.
- Starting downstream of the area to be sampled and moving upstream, at least 10 subsamples of the loose upper sediment deposits, not to exceed 3 centimeters in depth, were slowly scooped from an area where recently deposited sediment had collected.
- The scoops of sediment were carefully placed in the plastic bag, ensuring that fines were not lost during the scooping process. When sufficient volume was obtained, the scoop was used to remove large twigs, leaves, and other debris. Using a clean disposable pipette, the excess water from the sediment was decanted, and care was taken not to remove any fines. Allowing the sample to settle assisted in this effort.
- The bag was massaged to thoroughly mix the sample.
- The scoop was then used to fill sampling containers completely with sediment.

4.1.4 Surface Water and Sediment Analysis

Surface water was analyzed for:

- Munitions-related dissolved metals (antimony, copper, lead, and zinc) via USEPA 6020A
- Explosives via USEPA 8330B
- Hardness via USEPA SM2340B
- Perchlorate via USEPA 6860
- Biotic Ligand Model (BLM) parameters: temperature, pH (E150.1), dissolved organic carbon (USEPA 9060A), humic acid (USEPA 9060A), major cations (USEPA 6010B) and major anions (USEPA 300.0), and alkalinity (E310.1). The in-situ pH value was supplied from a calibrated probe at the time of sample collection.

- Field parameters: pH, conductivity, temperature, oxidation reduction potential, dissolved oxygen, and turbidity.

Sediment was analyzed for:

- Explosives via USEPA 8330B
- Munitions-related total metals (antimony, copper, lead, and zinc) via USEPA Method 6020A
- Simultaneously extracted metals (SEM)/acid volatile sulfide (AVS) via USEPA 821/R-91-100/EPA 6010
- Total organic carbon via Lloyd Kahn procedure.

4.2 Field Quality Assurance/Quality Control

QA/QC samples were collected to evaluate the surface water and sediment field collection methods and the laboratory analytical techniques. The QA/QC samples consisted of duplicate samples, matrix spike (MS)/matrix spike duplicate (MSD) samples, equipment blanks, and container blanks.

4.2.1 Field Duplicates

Duplicate samples were collected at a rate of one per 10 samples for surface water. All sample setup and collection procedures will be the same for surface water samples and field duplicates. All duplicate samples were submitted to the laboratory as indistinguishable samples and were labeled accordingly.

4.2.2 Matrix Spike/Matrix Spike Duplicates

MS/MSD samples were collected at a rate of one per 20 samples for surface water and sediment. Standard MS/MSD samples (triplicate volume: one for the native sample, one for the MS sample, and one for MSD sample) were collected for all analytes at the MS/MSD location. MS/MSDs were noted on sample labels and chains-of-custody. Chains-of-custody are included in **Appendix B**.

4.2.3 Equipment Blanks

Equipment blanks were collected at a minimum rate of one per 20 samples for surface water in accordance with the SSQAPP. For surface water, sample collection consisted of pumping laboratory-provided deionized water through all the tubing and filters. No sediment equipment blanks were required because dedicated and disposable equipment was used for sample collection.

4.2.4 Container Blanks

Container blanks were collected at a minimum rate of one per 20 samples for surface water. No sediment container blanks were collected per the USACHPPM Protocol. Container blanks were collected in accordance with the SSQAPP and consisted of pouring laboratory-provided deionized water directly into sample containers.

4.3 Data Validation and Completeness

An independent third-party reviewer, Environmental Data Services, LTD. performed Stage 2B validation on 90 percent of the laboratory data and stage 4 on 10 percent of the laboratory data. Validation was completed in accordance with the QAPP, the DoD Quality Systems Manual Revision 5.3, the USEPA National Functional Guidelines, and the DoD validation guidance as follows:

- USEPA National Functional Guideline for Inorganic Data Review, January 2017a
- USEPA National Functional Guidance for Organic Data Review, January 2017b
- DoD General Data Validation Guidelines, November 2019.

A Tier IV Data Validation Report was prepared for each Sample Delivery Group as assigned by the laboratory. Data validation reports are included as **Appendix E**.

There were no major issues identified for any of the data during validation. All the data were sufficiently precise and accurate for use. However, there were some minor issues that resulted in qualification of the data. The data validation qualifiers include:

- J = The analyte was positively identified; however, the result is estimated because of discrepancies in meeting certain analyte specific quality control criteria.

- U = The analyte was analyzed for, but not detected or is qualified as non-detected because of blank contamination.

- UJ = The analyte was not detected; however, the result is estimated because of discrepancies in meeting certain analyte-specific QC criteria.

The minor issues associated with blank contamination are as follows:

- The equipment blank associated with surface water samples had positive detections of antimony, calcium, copper, magnesium, water hardness, and zinc. All positive surface water results associated with this equipment blank were evaluated and qualified per validation guidance.

- The method blank associated with sediment samples had positive detections of SEM cadmium, SEM zinc, copper, lead, and zinc. Additionally, the calibration blank had positive detections of SEM cadmium and SEM zinc. Positive sediment results associated with these blanks were evaluated and qualified per validation guidance.

- The method blank associated with the surface water samples had positive detections of antimony, calcium, copper, magnesium, potassium, and zinc. Positive surface water results associated with this method blank were evaluated and qualified per validation guidance.

The minor issues associated with calibrations are as follows:

- The continuing calibration verification (CCV) for total organic carbon recovered below the QC limits. All the total organic carbon results were “J” qualified.

- The CCV for magnesium in samples JACKSON-CB-01 and JACKSON-EB-01 had a recovery above QC limits. The magnesium results in samples JACKSON-CB-01 and JACKSON-EB-01 were "J+" qualified.

The minor issues associated with MS/MSDs are as follows:

- The MS/MSD of sample JACKSON-SDMC3-DC-01 had a recovery outside QC limits for antimony. Antimony was qualified as "J" in sample JACKSON-SDMC3-DC-01.

- The MS/MSD of sample SDDUP had a recovery below QC limits for AVS. AVS was qualified "UJ" in sample SDDUP.

The minor issues associated with laboratory control samples are as follows:

- The laboratory control sample associated with all sediment samples had a recovery outside QC limits for total organic carbon. All total organic carbon results were qualified as "J" in sediment samples.

The minor issues associated with percent difference are as follows:

- The CCV had a percent difference outside QC limits for tetryl associated with sediment samples. All sediment tetryl results were qualified "UJ."

The minor issues associated with surrogates are as follows:

- The surrogate recoveries for explosives associated with the sediment sample JACKSON-SDMC1-DC-01 were below QC limits. Results for explosives were qualified "UJ" in sample JACKSON-SDMC1-DC-01.

- The surrogate recoveries for explosives associated with the surface water sample JACKSON-SWJC1-DC-01 were below QC limits. Results for explosives were qualified "UJ" in sample JACKSON-SWJC1-DC-01.

The minor issues associated with holding time exceedances are as follows:

- Sample JACKSON-SWCC2-DC-01 was analyzed 2 days outside of the 14-day holding time for alkalinity. The alkalinity result in sample JACKSON-SWCC2-DC-01 was "UJ" qualified.

The usability of the qualified data for risk assessment and decision-making was not impaired. The narratives from the data validation package are presented in **Appendix E**.

4.4 Screening Values/Criteria

Validated analytical results were compared to a prioritized list of regulatory standards and screening values (hereinafter referred to as "comparison values") as detailed in the Draft Operational Range Assessment Comparison Values Guidance (Draft Operational Range Assessment Comparison Values Guidance, December 2017). The DoD Components will use the following hierarchy for comparing sampling and modeling data:

- Applicable state-specific regulatory values
- Federal regulatory values
- State-specific screening values
- Federal screening values

Where there are multiple values for the same MC from the same source, the DoD Component will use the most conservative value (Draft Operational Range Assessment Comparison Values Guidance, December 2017).

Ecological screening levels for copper, lead, and zinc in surface water are dependent upon site-specific water hardness. The final ecological screening values were adjusted based on a site-specific minimum hardness of 25 milligrams per liter as specified in South Carolina regulations. Additionally, the BLM was used to further assess the potential impact of site-specific water chemistry on metals toxicity. The BLM data were used to calculate sample-specific criteria for comparison to copper detections from surface water results. BLM-adjusted screening levels can be more representative of site-specific water quality conditions than hardness-adjusted screening levels in waters with higher dissolved organic carbon and low hardness. Therefore, if a copper detection exceeded the hardness-derived screening level, then it was compared to the BLM-adjusted screening level. BLM values are specific to the conditions in which the parameters were collected; therefore, values cannot be used for statistical comparison.

Sediment samples were analyzed for SEM/AVS and total organic carbon. As part of the weight-of-evidence evaluation, the ΣSEM/AVS ratio and the fraction of organic carbon (f_{oc}) were used to determine the bioavailability of metals to benthic organisms and assist in determining if the detected concentrations of divalent cations may, or may not, cause toxicity to benthic organisms.

4.5 Data Analysis

4.5.1 Data Validation

The first step in the process of screening MCOC was the evaluation of analytical data on the basis of qualifiers and the frequency of detection in each medium of concern. Inclusion or exclusion of data on the basis of analytical qualifiers was performed in accordance with the 2017 USEPA National Functional Guidelines:

- Analytical results bearing the U qualifier (indicating that the analyte was not detected at the given detection limit) or UJ qualifier (indicating that the analyte was not detected and the quantitation limit may be inaccurate or imprecise) were retained in the data set and considered non-detects. Where warranted for statistical purposes, each non-detect MCOC was assigned a numerical value of its full limit of detection.

- Analytical results bearing the J qualifier indicating that the reported value was estimated because the analyte was detected at a concentration between the detection limit and the limit of quantitation or because there were quality control criteria outside acceptable limits were retained at the measured concentration.

4.5.2 Surface Water and Sediment Data Analysis

Due to the contractual modification of the USACHPPM Protocol, which consisted of a single grab sample at each location, a statistical analysis was not performed on surface water or sediment sampling results. Instead, a direct comparison to the associated screening levels was used in a discussion of the sampling results.

4.6 Data Uncertainty

As specified in the USACHPPM Protocol, uncertainty of the data obtained should be considered. For the surface water system at Fort Jackson/McCrady Training Center, data uncertainty was related to temporal and hydrologic variability when collecting a single grab sample. Relying on a single sample to provide a complete assessment of the data removes the possibility for a statistical analysis and allows for anomalous results from that single point in time in which the sample was taken. Additionally, a single grab sample does not represent a chronic condition. In order to limit data uncertainty, it is recommended that composite surface water samples are collected over a specified period of time (24-hour period for clear weather sampling events and 2-hour period for storm sampling events) during the wet and dry seasons to capture the temporal and hydrologic variability and reduce data uncertainty. While the calculation of statistical parameters to establish a representative measure of site conditions is limited when collecting a smaller data set, the collection of composite surface water samples aids in reducing data uncertainty. Additionally, selecting the worst-case scenario for MC migration aids in answering the study question of whether sufficient evidence to show off-range MC migration or release.

For surface water analysis, the sample analysis method identified in the 2023 Fort Jackson/McCrady Training Center SSQAPP was USEPA SW6020A, which analyzes dissolved metals (antimony, copper, lead, and zinc) at low concentration levels. Due to the detection limits provided in this analytical method and the low water hardness found at Fort Jackson/McCrady Training Center there is a greater likelihood of data uncertainty, and this is due to ecological screening levels of metals being below reported detection limits.

4.7 Deviations from the Site-Specific Quality Assurance Project Plan

A deviation from the SSQAPP occurred during sample collection at Fort Jackson/McCrady Training Center. Samples for explosives were not collected from the reference location, CC2, as sampling for background concentrations of these compounds was not considered necessary based on a review of current and historic range use and given no detections in previous samples.

This page intentionally left blank

5.0 Advanced Assessment Results and Discussion

Analytical data tables presenting the individual surface water and sediment sampling results are provided in **Appendix F**. Results for metals MCOC are summarized in **Table 5-1** and **Table 5-2**. **Figure 5-1** and **Figure 5-3** show the comparison between the sample results and the screening levels for metals MCOC in surface water and sediment, respectively. **Figure 5-2** and **Figure 5-4** show the comparison between the downstream concentrations and the reference concentrations at each sample location for metals MCOC in surface water and sediment, respectively.

5.1 Surface Water and Sediment Sampling Results

For surface water, results are initially compared to the state regulatory standards (ecological) based on the hierarchy described in Section 4.4. In cases where the result exceeds its state ecological regulatory standard, the result also exceeds the federal ecological standard due to the more conservative calculation of the federal screening level based on site-specific hardness as opposed to a floor value of 25 milligram per kilogram (mg/kg) of calcium carbonate used for state screening level calculations.

5.1.1 SWCC3 – Colonels Creek

For surface water, lead (0.34 microgram per liter [µg/L]) did not exceed the value of lead at the reference location; however, the value exceeded the state specific freshwater ecological regulatory level of 0.02 µg/L. No detected concentrations of antimony, copper, or zinc exceeded their respective reference values and did not exceed the freshwater ecological regulatory levels. Additionally, no explosives were detected in surface water. The perchlorate value did not exceed the reference value and did not exceed the screening value.

For sediment, no downstream concentrations of metals MC were found to be greater than their respective reference concentrations. Additionally, no concentrations of metals MC exceeded their respective ecological sediment screening levels. The ΣSEM/AVS ratios were less than 1 and the normalized ΣSEM-AVS/f_{oc} ratios were less than 130 micromoles per gram of organic carbon (µmol/g_{oc}). No explosives were detected in sediment.

5.1.2 SWCC4 – Colonels Creek

For surface water, lead (0.26 µg/L) did not exceed the value of lead at the reference location; however, the value exceeded the state specific freshwater ecological regulatory level of 0.02 µg/L. No detected concentrations of antimony, copper, or zinc exceeded their respective reference values and did not exceed the ecological regulatory levels. Additionally, no explosives were detected in surface water. The perchlorate value did not exceed the reference and did not exceed the screening value.

For sediment, no downstream concentrations of metals MC were found to be greater than the reference concentrations. Additionally, no concentrations of metals MC exceeded the ecological sediment screening levels. The ΣSEM/AVS ratios were less than 1 and the normalized ΣSEM-AVS/f_{oc} ratios were less than 130 µmol/g_{oc}. No explosives were detected in sediment.

5.1.3 SWMC1 – Mill Creek

For surface water, no detected concentrations of antimony, copper, lead, or zinc exceeded their respective reference values and did not exceed the ecological regulatory levels. Additionally, no explosives or perchlorate were detected in surface water.

For sediment, no downstream concentrations of metals MC were found to be greater than the reference concentrations. Additionally, no concentrations of metals MC exceeded the ecological sediment screening levels. The ΣSEM/AVS ratios were less than 1 and the normalized ΣSEM-AVS/f_{oc} ratios were less than 130 µmol/g_{oc}. No explosives were detected in sediment.

5.1.4 SWMC2 – Mill Creek

For surface water, lead (3.25 µg/L) exceeded the reference value of 0.853 J µg/L. Additionally, lead exceeded the state specific freshwater ecological regulatory level of 0.12 µg/L. No detected concentrations of antimony, copper, or zinc exceeded their respective reference values and did not exceed the ecological regulatory levels. No explosives were detected in surface water. The perchlorate value did not exceed the reference value and did not exceed the screening level value.

For sediment, no downstream concentrations of metals MC were found to be greater than the reference concentrations. Additionally, no concentrations of metals MC exceeded the ecological sediment screening levels. The ΣSEM/AVS ratios were less than 1 and the normalized ΣSEM-AVS/f_{oc} ratios were less than 130 µmol/g_{oc}. No explosives were detected in sediment.

5.1.5 SWMC3 – Mill Creek

For surface water, lead exceeded the reference value of 0.853 J µg/L. Additionally, lead (2.18 µg/L) exceeded the state specific freshwater ecological regulatory level of 0.1 µg/L. No detected concentrations of antimony, copper, or zinc exceeded their respective reference values and did not exceed the ecological regulatory levels. No explosives were detected in surface water. The perchlorate value did not exceed the reference value and did not exceed the screening level value.

For sediment, no downstream concentrations of metals MC were found to be greater than the reference concentrations. Additionally, no concentrations of metals MC exceeded the ecological sediment screening levels. The ΣSEM/AVS ratios were less than 1 and the normalized ΣSEM-AVS/f_{oc} ratios were less than 130 µmol/g_{oc}. No explosives were detected in sediment.

5.1.6 SWJC1 – Jumping Run Creek

For surface water, no detected concentrations of antimony, copper, lead, or zinc exceeded their respective reference values and did not exceed the ecological regulatory levels. Additionally, no explosives or perchlorate were detected in surface water.

For sediment, no downstream concentrations of metals MC were found to be greater than the reference concentrations. Additionally, no concentrations of metals MC exceeded the ecological sediment screening levels. The ΣSEM/AVS ratios were less than 1 and the normalized ΣSEM-AVS/f_{oc} ratios were less than 130 µmol/g_{oc}. No explosives were detected in sediment.

Antimony	2.0	0.023 J	N	0.08 J	0.15 J	N
Copper	31.6	0.4	N	1.18	21.6	N
Lead	35.8	0.747	N	7.84	33.3	N
Zinc	121	< 0.88 U	N	4.11	8.5	N

Notes:
(a) PALs refer to the lower of the USEPA Region 4 Freshwater Sediment Screening Values (2018) and the USEPA Region 3 Freshwater Sediment Screening Benchmarks (BTAG) (August 2006)
Bold indicates that the sample result exceeds the associated USEPA freshwater ecological regulatory level PAL.

1589

5.2 Surface Water and Sediment Discussion

For surface water metals results, the sample analysis method identified in the 2023 Fort Jackson/McCrady Training Center SSQAPP is USEPA SW6020A. This method was followed for dissolved metals (antimony, copper, lead, and zinc) analysis at low concentration levels. However, because of higher detection limits associated with this analytical method, greater data uncertainty is likely if presented with laboratory method blank contamination, as was observed during the analysis of the Fort Jackson/McCrady Training Center surface water metals samples. Additionally, based on the surface water, state ecological screening values that were calculated from site-specific water hardness, SW6020A analytical method detection limits for metals were not sensitive enough when comparing to the ecological screening values in streams with low water hardness. Specifically for Fort Jackson/McCrady Training Center, water hardness values ranged from 2 mg/L to 8 mg/L of CaCO3 during the March sampling event, which resulted in low ecological screening values. It should be noted that water hardness is impacted by seasonal variations and the low hardness observed during the Advanced Assessment sampling effort does not necessarily represent hardness in other seasons.

Because of these higher detection limits, which were exacerbated by laboratory method blank contamination and the low water hardness, no determination can be made to evaluate if metals concentrations, including antimony, copper, and zinc, in surface water exceed the hardness-calculated ecological screening values. Based on these factors, it is recommended that future ORA assessments analyze surface water at Fort Jackson/McCrady Training Center using USEPA 1638 and follow a multi-seasonal sampling approach to provide a more robust dataset that benefits from a statistical analysis of the data results. USEPA 1638 utilizes lower detection limits and employs more stringent laboratory techniques that minimize potential cross-contamination during the analysis process. Therefore, USEPA 1638 is the preferred analytical method for sites with low water hardness.

5.2.1 Colonels Creek

Surface water sampling results indicate that there is no migration of metals, explosives, or perchlorate at SWCC3 or SWCC4, since no downstream concentrations exceeded reference concentrations. Therefore, there is no range-related risk to downstream receptors. Although the downstream concentration of lead at both SWCC3 and SWCC4 exceeded the screening criteria, concentrations did not exceed reference and the risk is not attributable to range activities.

For sediment at Colonels Creek, no metals exceeded their respective reference concentrations or exceeded their respective ecological screening levels. Therefore, there is no migration from the operational range area and sediment does not pose a potential risk to downstream ecological receptors. As no explosives were detected, there is no migration from the operational range area and no risk to off-range receptors. Additionally, the ΣSEM/AVS ratios less than 1 and the normalized ΣSEM-AVS/f_{oc} ratios less than 130 μmol/g_{oc}, indicate that divalent metals should not cause direct toxicity to benthic organisms.

During the 2014 ORA Phase II, antimony, copper, lead, and zinc were detected in surface water at values above the reference values in individual sampling events conducted at SWCC3. Antimony exceeded the reference values from two wet sampling events. Copper exceeded the reference values from one dry sampling event, one storm sampling event, and two wet sampling events. Lead exceeded the reference values from one dry sampling event, one storm sampling event, and two wet sampling events. Zinc exceeded the reference value from one dry sampling event. Based on these reference value exceedances, there is evidence of potential range-related MC migration in surface water. In sediment, antimony, copper, lead, and zinc were detected at values above the reference values in individual sampling events. Antimony

exceeded the reference values from one wet sampling event. Copper exceeded the reference values from two dry sampling events and one wet sampling event. Lead exceeded the reference values from two dry sampling events and one wet sampling event. Zinc exceeded the reference values from two dry sampling events and one wet sampling event. Therefore, there is evidence of potential range-related MC migration in sediment. No MC were detected above the PALs in surface water or sediment at the downstream location in Colonels Creek; therefore, there was no risk identified to potential receptors. SWCC4 was not sampled during the 2014 ORA Phase II, so there are no prior data to compare to the Advanced Assessment sampling results.

It was noted that analyte values for all metals were found to be higher in the Colonels Creek reference location sediment samples than in all downstream location sediment samples during the 2023 sampling event. This is consistent to the 2014 ORA Phase II, where notably high analyte values were collected at the same reference location. In particular, the 2014 data showed that lead exceeded the PAL during one dry sampling event. The consistently high analyte values found in the reference location may influence where migration is determined. An additional reference location sampled in 2014, showed lower analyte values, and this location could be considered for future monitoring.

5.2.2 Mill Creek

Surface water sampling results at SWMC1 indicate that there is no migration of metals, explosives, or perchlorate at SWMC1, since none of these analytes exceeded their respective reference comparison values or ecological screening levels. Therefore, there is no migration from the operational range area and no risk to downstream receptors. For sediment at SWMC1, no metals or explosives exceeded their reference comparison values or respective ecological screening. Therefore, there is no migration from the operational range area and sediment does not pose a potential risk to downstream ecological receptors. Additionally, the ΣSEM/AVS ratios less than 1 and the normalized ΣSEM-AVS/f_{oc} ratios less than 130 μmol/g_{oc}, indicate that divalent metals should not cause direct toxicity to benthic organisms.

Surface water sampling results at SWMC2 and SWMC3 indicate that lead is migrating off-range due to the lead value exceeding the reference value, via Mill Creek, downstream of the ponded area within nonoperational area and from upgradient source areas. Additionally, the lead value exceeded the ecological screening level, indicating there is a potential risk to downstream receptors. For sediment at SWMC2 and SWMC3, no metals or explosives exceeded their respective ecological screening levels or reference comparison values. Therefore, there is no migration from the operational range area and sediment does not pose a potential risk to downstream ecological receptors. Additionally, the ΣSEM/AVS ratios less than 1 and the normalized ΣSEM-AVS/f_{oc} ratios less than 130 μmol/g_{oc}, indicate that divalent metals should not cause direct toxicity to benthic organisms.

No location in Mill Creek was sampled during the 2014 ORA Phase II, so there are no prior data to compare to the Advanced Assessment sampling results.

Sampling locations, SWSC2 and SWMC3, were suspected to potentially receive baseflow from groundwater from an adjacent landfill site. Due to the elevated lead concentrations found at SWMC2 and SWMC3, local landfill data was assessed. Fort Jackson personnel confirmed two Installation Restoration Program (IRP) sites are located upstream of SWMC2 and SWMC3: Solid Waste Management Unit (SWMU) 21 (Construction Debris Landfill- Range 17) and Area of Concern (AOC) K (Soils Evaluation Adjacent to SWMU 21). AOC K was granted a No Further Action (NFA) status per the Hazardous Waste Permit SC3 210 020 449 that was issued in 2010 (U.S. Army Garrison Fort Jackson 2020). Based on this classification, it is unlikely the Advanced Assessment ORA sampling exceedances were influenced by AOC

K. Sampling results from 2022, provided by installation personnel, indicate that lead has been reported at a maximum value of 5.6 µg/L in one of three monitoring wells for SWMU21, and values of 0.33 µg/L and 0.36 µg/L were detected in the two additional monitoring wells. These values exceed the state specific freshwater ecological regulatory level used under the ORA investigation (0.12 µg/L for MC2 and 0.1 µg/L for MC3). The location of SWMU 21 is upstream of all three sampling locations at Mill Creek, but it is possible that there is underflow SWMC1 and that dissolved lead from the landfill enters the stream as baseflow farther downgradient. It cannot be confirmed whether SWMU 21 is partially contributing to the lead exceedances at SWMC2 and SWMC3 or if the operational range area of Fort Jackson contributed to the exceedances, as Range 19, Range 18, and Range 17, or if another source exists in the watershed.

5.2.3 Jumping Run Creek

Surface water sampling results indicate that there is no migration from metals, explosives, or perchlorate at SWJC1, since none of these analytes exceeded their respective reference comparison values; therefore, there is no migration from the operational range area. Additionally, metals, explosives, or perchlorate did not exceed the ecological screening levels, so there is no risk to downstream receptors.

For sediment, no metals or explosives exceeded their respective reference comparison values or ecological screening levels. Therefore, there is no migration from the operational range area and sediment does not pose a potential risk to downstream ecological receptors. Additionally, the ΣSEM/AVS ratios less than 1 and the normalized ΣSEM-AVS/f_{oc} ratios less than 130 µmol/g_{oc} indicate that divalent metals should not cause direct toxicity to benthic organisms.

During the 2014 ORA Phase II, antimony, copper and lead were detected in surface water at values above the reference values in individual sampling events. Antimony exceeded the reference value from one dry sampling event, copper exceeded the reference value from one wet sampling event, and lead exceeded the reference value from one dry sampling event. Based on these reference value exceedances, there is evidence of potential range-related MC migration in surface water. In sediment, copper, lead, and zinc were detected at values above the reference values in individual sampling events. Copper exceeded the reference values from two dry sampling events and one wet sampling event. Lead exceeded the reference values from two dry sampling events and one wet sampling event. Zinc exceeded the reference values from two dry sampling events and one wet sampling event. Therefore, there is evidence of potential range-related MC migration in sediment. No MC were detected above the PALs in surface water or sediment at the downstream location in Jumping Run Creek; therefore, there was no risk identified to potential receptors.

6.0 Summary and Conclusions

The Advanced Assessment at Fort Jackson / McCrady Training Center, South Carolina, evaluated three watersheds, Mill Creek, Upper Colonels Creek, and Lower Colonels Creek, that drain the operational range area of Fort Jackson/McCrady Training Center. These watersheds were designated the worst-case scenario and assessed for surface water system MCOC migration and risk. Additional source areas (Upper Gills Creek including Boyden Arbor Pond) and pathways (groundwater in Cedar Creek) are already being addressed under other environmental programs and were not assessed under this Advanced Assessment. Lower Gills Creek (Wildcat Creek) includes the cantonment area and several maneuver and training areas with a limited source of munitions.

Sampling of surface water and sediment consisted of a single grab sample at the six downstream locations (SWMC1, SWMC2, SWMC3, SWCC3, SWCC4, and SWJC1) and one reference location (SWCC2). Because of higher detection limits associated with the analytical method (USEPA SW6020A), which was utilized for surface water metals analysis, and which were exacerbated by laboratory method blank contamination issues, the majority of surface water metals results were qualified as non-detect. The surface water metals results that did not qualify as non-detect included lead detections that exceeded reference concentrations and state-specific freshwater ecological regulatory levels at SWMC2 and SWMC3; therefore, the Mill Creek Watershed was determined to be Referred. For ranges within Upper Colonels Creek and Lower Colonels Creek, potential migration of metals MCOC via surface water remains Inconclusive. Perchlorate detections in surface water were reported to be less than the reference concentration and regulatory level. There were no detections of explosives in surface water. Sediment results indicated there is no migration of metals from source areas at Fort Jackson/McCrady Training Center and no detections exceeding screening values. No explosives were detected in sediment.

Based on surface water sampling results from the two locations within the Mill Creek Watershed, SWMC2 and SWMC3, both located on perennial Mill Creek, lead was found to be migrating off-range at concentrations that may pose an unacceptable risk to off-range ecological receptors. The range areas draining to these locations include all or portions of live-fire ranges, impact areas, and maneuver training areas, totaling 4,372.22 acres. However, two IRP sites (AOC K and SWMU 21) are located upstream of SWMC2 and SWMC3. It was determined that AOC K does not impact the Advanced Assessment sampling results due to the NFA status. Analytical data from SWMU 21 indicated that lead detections do exceed the PAL used under ORA and SWMU 21 may be a contributing factor to the surface water concentrations detected at SWMC2 and SWMC3. However, it is unclear if lead exceedances are the result of operational range contributions, landfill leachate influence, another source in the watershed, or a combination of factors.

The worst-case scenario for groundwater in the conceptual site model was explosives along the south-central boundary, and that assessment, originally part of the last ORA study, is now being handled under another environmental program. With the site being characterized, activities now include a Feasibility Study for a subsurface soil source of RDX. The Proposed Plan for remedial actions at that site is being finalized.

Based on the findings of this Advanced Assessment, it is recommended that all or portions of the 3 firing ranges, 1 non-dudded impact area, 2 historical impact areas, and 16 maneuver and training areas within the Mill Creek Watershed of Fort Jackson, encompassing 4,372.22 acres, be categorized as Referred due to the migration of lead MC off-range in surface water at concentrations exceeding the state-specific standard and that potentially pose an unacceptable risk to off-range ecological receptors. Additionally, based on the Inconclusive results of the surface water samples for metals MCOC, this Advanced Assessment recommends that future ORA assessments analyze surface water at Fort Jackson/McCrady Training Center using USEPA 1638 (trace metals analysis) to accommodate for the low water hardness and follow a multi-

seasonal sampling approach to provide a more robust dataset that benefits from a statistical analysis of the data results**.** The Army and Fort Jackson/McCrady Training Center will determine appropriate further analysis to better characterize the risk posed by these ranges and monitor MC migration off-range.

All of Fort Jackson/McCrady Training Center's operational ranges should be included in the FY23–27 cycle of ORAs to meet DoDI requirements. Table 6-1 and Figure 6-1 summarize the Advanced Assessment findings.

This page intentionally left blank

1880 **Table 6-1: Summary of Findings and Conclusions for Fort Jackson/McCrady Training Center**

Category	Total Number of Ranges and Acreage	Source(s)	Pathway(s)	Human Receptors	Ecological Receptors	Conclusions and Rationale
Inconclusive; 46,950.56 acres	53 firing ranges, 4 dudded impact areas, 14 non-dudded impact areas, 39 maneuver and training areas, and 16 historic impact areas	Maneuver training areas live-fire ranges, impact areas	Surface water-Colonels Creek, Cedar Creek, and Gills Creek Groundwater-Middendorf Aquifer	Recreation users of Weston Lake and users of the recreational facilities at Weston Lake.	Threatened and endangered species and sensitive environments downstream of operational areas.	Undetermined potential of metals in surface water. All Inconclusive ranges should be included in the FY23–27 cycle of ORAs, to meet DoDI requirements.
Referred; 4,372.22 acres	3 firing ranges, 1 non-dudded impact area, 2 historical impact areas, and 16 maneuver and training areas	Maneuver training areas live-fire ranges, impact areas	Mill Creek watersheds	Recreation users Old Heises Pond.		MC (lead) associated with the southern portion of the Mill Creek Watershed and are potentially migrating off-range via surface water at levels that pose an unacceptable risk to off-range human and/or ecological receptors. For sediment no MC were determined to be migrating at levels that pose an unacceptable risk to off-range human and/or ecological receptors. The Army and Fort Jackson will determine appropriate further analysis to better characterize the risk posed by these ranges and monitor MC migration off-range.

Re: **Draft Final Operational Range Assessment Program Phase I Qualitative Assessment Report**
Fort Jackson, South Carolina

Dear Ms. Williams:

1. Enclosed (3 hard copies and 2 electronic copies) is the Draft Final Operational Range Assessment Program Phase I Qualitative Assessment Report for Fort Jackson, South Carolina. In addition to the Report, the electronic copies also include a copy of the Read-Ahead Package, Site Visit Trip Report, and the Response to Comments documents for the Draft version of the Report.

2. The Army Environmental Division of the Army Headquarters has recently directed that Phase I Qualitative Assessment Reports with at least one range characterized as "Inconclusive" will remain in the "Draft Final" status. The reason for remaining in the "Draft Final" status is that "Inconclusive" ranges require further assessment (Phase II) and therefore the assessment process is not complete. Phase II assessments will begin in 2010. The Phase I report will be incorporated into the corresponding Phase II report as an appendix with the Phase I Conceptual Site Model forming the basis of Phase II sampling.

3. The Technical Outreach Guidance (TOG) for the Operational Range Assessment Program and a Department of Defense Memorandum are also enclosed. These documents provide additional information on how to address questions regarding the Phase I Assessment Report. Any new guidance will be provided to you as it is developed.

4. If you have any questions regarding this matter please call John Buck, USAEC, at 410-436-4844 or me at 813-242-7208.

Regards,

MALCOLM PIRNIE, INC.

EXECUTIVE SUMMARY

The United States (U.S.) Army is conducting qualitative assessments at operational ranges to meet the requirements of Department of Defense policy and to support the U.S. Army Sustainable Range Program. The operational range qualitative assessment (hereinafter referred to as Phase I Assessment) is the first phase of the U.S. Army Operational Range Assessment Program (ORAP). This Phase I Assessment evaluates Fort Jackson's operational range area to assess whether further investigation is needed to determine if potential munitions constituents of concern (MCOC) are or could be migrating off-range at levels that may pose an unacceptable risk to human health or the environment. In conducting the Phase I Assessment, MCOC sources, potential off-range migration pathways, and potential off-range human and ecological receptors are evaluated as appropriate.

Fort Jackson occupies approximately 51,961 acres in Richland County, South Carolina (SC). The SC Army National Guard holds a non-exclusive license for training operations over approximately 14,990 acres of Fort Jackson. Therefore, this acreage has not been included in the Fort Jackson ORAP Phase I Assessment, which investigates only the operational ranges operated by the U.S. Army Training Center. The resulting acreage of Fort Jackson for purposes of this assessment is 36,971. The installation has been incorporated into the eastern section of the city of Columbia, SC. The primary mission of Fort Jackson is to train initial entry recruits for duty as soldiers for Army units. To support this mission, Fort Jackson currently houses Army training brigades and serves as a reception station that processes newly inducted and prior service personnel forwarded to the installation from recruiting and induction stations.

As part of the Operational Range Inventory Sustainment, an update to the Army Range Inventory Database-Geodatabase (ARID-GEO) was submitted to the U.S. Army Environmental Command in March 2006 (ARID-GEO [2006]). ARID-GEO (2006) identified 104 operational range areas at Fort Jackson that are operated by the U.S. Army Training Center, encompassing a total of 29,716.58 acres. During data collection for this report, it was determined that several of the ranges overlap one another, resulting in an actual operational acreage of 29,475.19. The operational areas support a variety of activities including live-fire weapons training, heavy and light maneuver exercises, dudded and non-dudded impact areas, and specialty training courses such as night-infiltration and military operations in urban terrain. Many of these ranges currently receive heavy usage by soldiers undergoing basic training.

The 104 operational ranges at Fort Jackson that are operated by the U.S. Army Training Center are categorized as Inconclusive or Unlikely.

Inconclusive – Phase II Quantitative Assessment Required

Fifty-one ranges at Fort Jackson are categorized as Inconclusive, totaling 16,471 acres. These ranges consist of impact areas, medium and large caliber firing ranges, small arms ranges, and training areas that either contain artillery or mortar firing points or known or suspected dudded areas or have received heavy historical munitions usage. Ranges categorized as Inconclusive are those operational ranges where either existing information is insufficient to make a source-receptor interaction determination or the information indicates the potential for such interaction to be occurring. Ranges categorized as Inconclusive will undergo Phase II of the ORAP, consisting of a quantitative assessment with sampling and additional data collection.

Unlikely – Five-Year Review

Fifty-three ranges at Fort Jackson are categorized as Unlikely, totaling 13,004 acres. These ranges consist of training areas. Ranges where, based upon a review of readily available information, there is sufficient evidence to show that there are no known releases or source-receptor interactions that could present an unacceptable risk to human health or the environment are categorized as Unlikely. Ranges categorized as Unlikely are required to be re-evaluated at least every five years. Re-evaluation may occur sooner if significant changes (e.g., change in range operations, site conditions, regulatory changes) occur that affect determinations made during this Phase I Assessment.

Table ES-1 summarizes the Phase I Assessment findings.

Table ES-1: Summary of Findings and Conclusions for Fort Jackson

Category	Total Number of Ranges and Acreage	Source(s)	Pathway(s)	Human Receptors	Ecological Receptors	Conclusions and Rationale
Inconclusive	36 operational ranges; 12,425 acres	Firing points, small arms firing, dudded impact areas, and heavy historical munitions usage	Mill Creek, Sun View Lake, and Lake Rebecca (southwest of Fort Jackson in Mill Creek watershed); Gills Creek and Forest Lake (west and southwest of Fort Jackson in Gills Creek watershed); Weston Lake and Cedar Creek (non-operational area southwest of the eastern impact area in Cedar Creek watershed); surficial groundwater aquifer (south and west of Fort Jackson in Mills Creek, Gills Creek, and Cedar Creek watersheds)	Residents down gradient, local and off-range residents, and recreational users of Weston Lake, Twin Lakes, Sun View Lake, Lake Rebecca, and Forest Lake	Wetlands and threatened and endangered species downstream	Phase II Quantitative Assessment is required. Residents and recreational users are present down gradient and downstream.
	15 operational ranges; 4,046 acres	Firing points, small arms firing, known or suspected dudded areas, and historical artillery impact areas or heavy historical usage	Colonels Creek and Murray Pond (southeast of McCrady Training Center)	Recreational users of Murray Pond	Wetlands and threatened and endangered species downstream	Phase II Quantitative Assessment is required. Recreational users are present downstream.
Unlikely	53 operational ranges; 13,004 acres	No source – limited or no military munitions use	Not evaluated (no source was identified)			Re-evaluate during the five-year review. No source was identified.

1.0 Introduction

The United States (U.S.) Army is conducting qualitative assessments at operational ranges to meet the requirements of Department of Defense (DoD) policy and to support the U.S. Army Sustainable Range Program. The operational range qualitative assessment (hereinafter referred to as Phase I Assessment) is the first phase of the U.S. Army Operational Range Assessment Program (ORAP). The Phase I Assessment will review readily available data to evaluate, verify, validate, document, and report on operational ranges within the United States and its territories. Phase I Assessments are being conducted on Active Army, Army Reserve, and Army National Guard installations (including both federally and state owned).

The conclusions in this report have been based, in part, on information obtained from third parties and may include environmental assessment reports, environmental agency records, historical aerial photographs, and other public records obtained from various sources. Unless noted, Malcolm Pirnie has not independently evaluated or verified the accuracy or completeness of such third party information. Visual observations of the site only represent conditions at the time of the site visit. Malcolm Pirnie makes no warranties that the on-site observations made during the site visit are representative of historical or future conditions at the site.

1.1 Project Scope and Drivers

The Phase I Assessment process evaluates potential source-receptor interaction between off-range[1] receptors and the potential munitions constituents of concern (MCOC) migrating from all operational ranges within the Operational Range Inventory.

The ORAP is being implemented to fulfill requirements identified implicitly or explicitly in:

- DoD Directive 4715.11 *Environmental and Explosives Safety Management on Operational Ranges Within the United States* (2004) and
- DoD Instruction (DODI) 4715.14 *Operational Range Assessments* (2005).

1.2 Purpose

The purpose of this Phase I Assessment is to evaluate Fort Jackson's operational ranges to assess whether further investigation is needed to determine if potential MCOC are or could be migrating off-range at levels that may pose an unacceptable risk to human health or the environment.

Based on the readily available data obtained during the Phase I Assessment process, all operational ranges at Fort Jackson were placed into groups according to military munitions use and the presence or absence of potential MCOC, migration pathways, and receptors. Each operational range group was then placed into one of three possible categories – Referred, Inconclusive, or Unlikely:

[1] Off-range areas include those areas outside of the boundaries of the operational range area, as established by the Army Range Inventory Database-Geodatabase (ARID-GEO). Off-range areas may include both on-installation (e.g., cantonment areas) and off-installation areas or locations.

- **Referred – Refer to Appropriate Cleanup Program**: ranges with compelling evidence (e.g., sampling data) to indicate the presence of an off-range release that potentially poses an unacceptable risk to human health or the environment
- **Inconclusive – Phase II Quantitative Assessment Required**: ranges where existing information either is insufficient to make a source-receptor interaction determination or indicates the potential for such interaction to be occurring
- **Unlikely – Five-Year Review**[2]: ranges where, based upon a review of readily available information, there is sufficient evidence to show that there are no known releases or source-receptor interactions that could present an unacceptable risk to human health or the environment

Appendix A provides a glossary of common terms referred to in the ORAP.

1.3 General Installation Information

Fort Jackson occupies approximately 51,961 acres in Richland County, South Carolina (SC). The SC Army National Guard (SCARNG) holds a non-exclusive license for training operations over approximately 14,990 acres of the eastern portion of Fort Jackson. Therefore, this acreage has not been included in the Fort Jackson ORAP Phase I Assessment, which investigates only the operational ranges operated by the U.S. Army Training Center. The resulting acreage of Fort Jackson for purposes of this assessment is 36,971. The installation has been incorporated into the eastern section of the city of Columbia, SC. The main gate is located at the intersection of Forest Drive and Interstate 77, which parallels most of the western installation boundary. Interstate 20 is located just north of the installation, and Leesburg Road (Highway 262) forms the southern installation boundary. **Figure 1-1** illustrates the general location of Fort Jackson.

Fort Jackson was originally established in 1917 as an infantry training center (referred to as Camp Jackson). The installation was inactive from 1921 to 1925. In 1925, the War Department decided to use the post again as a training camp for the SCARNG. From 1925 to 1939, it was controlled by the state and used as an encampment and training area for SCARNG troops. During World War II, Fort Jackson became a permanent military installation, used primarily for infantry training. Additional property was acquired on the eastern and northern sides of the installation until the acreage included 52,562 acres. Fort Jackson grew over the years, but most of the buildings were temporary. In 1964, construction began on permanent steel and concrete buildings to replace wooden barracks that had housed the fort's troops since the early 1940s. With the establishment of the modern volunteer Army in 1970 and the need to promote the attractiveness of service life, construction peaked in an effort to modernize facilities and improve services. In June 1973, Fort Jackson was designated as a U.S. Army Training Center. As a result of Base Realignment and Closure actions during the early 1990s, Fort Jackson received additional missions and personnel, including the Soldier Support Institute (consisting of the Adjutant General School, Finance School, and Recruiting and Retention School), Chaplain Center and School, and the DoD Polygraph Institute. The current and primary mission of Fort Jackson is to train initial entry recruits for duty as soldiers for Army units. To support this

[2] All operational ranges must be periodically re-evaluated to determine if there is a release or substantial threat of release of MCOC from an operational range to an off-range area. Range groups categorized as Unlikely are to be re-evaluated at least every five years. Re-evaluation may occur sooner if significant changes (e.g., changes in range operations or site conditions, regulatory changes) occur that affect determinations made during the Phase I Assessment.

mission, Fort Jackson currently houses Army training brigades and serves as a reception station that processes newly inducted and prior service personnel forwarded to the installation from recruiting and induction stations. Fort Jackson is the largest and most active initial entry center in the U.S. Army, providing training to approximately 25 percent of the men and women who enter the service each year. The installation instructs approximately 55,000 to 65,000 soldiers each year, including participants in Basic Combat Training, Advanced Individual Training, and many professional schools (GlobalSecurity.org, 2006).

A draft Operational Range Inventory Sustainment update was submitted to the U.S. Army Environmental Command (USAEC) in March 2006 (ARID-GEO [2006]). The ARID-GEO (2006) identified 104 operational ranges operated by the U.S. Army Training Center, encompassing a total of 29,717 acres. During data collection for this report, it was determined that several of the ranges overlap one another, resulting in an actual operational acreage of 29,475.19. This is explained in further detail in Section 5.4. The operational areas support a variety of activities, including live-fire weapons training, heavy and light maneuver exercises, dudded and non-dudded impact areas, and various specialty training courses such as night infiltration and military operations in urban terrain. Many of the operational ranges currently receive heavy usage by soldiers undergoing basic training. **Figure 1-2** illustrates the operational range areas identified in the ARID-GEO (2006).

2.0 Assumptions, Programmatic Exclusions and Data Collection Efforts

2.1 Assumptions

Statements in this report were made using available supporting documents and data obtained during the centralized data collection efforts and site visit conducted at Fort Jackson from 10 October 2006 through 13 October 2006. The findings and conclusions of the supporting documents and data are assumed to be accurate and scientifically defensible. Conclusions and recommendations are based on the data gathered during the Phase I Assessment.

The Phase I Assessment assumes that the primary pathways for off-range migration are water related (i.e., surface water, sediment, and groundwater). This is to conform to the DODI 4715.14 emphasis on off-range migration (DoD, 2005). Other media may be considered, if warranted based on site-specific conditions.

2.2 Programmatic Considerations and Exclusions

For the purposes of the Phase I Assessment, an unacceptable risk to human health or the environment may occur if there is a source of MCOC, a pathway for MCOC to potentially move off-range, and an off-range receptor that may be impacted by the migrating MCOC. Where all three of these elements are present, further evaluation may be required. The paragraphs below present the potential pathways and receptors considered for the Phase I Assessments. Potential MCOC migration pathways that have been evaluated and programmatically excluded (except in unique situations that compel their inclusion) are also presented.

2.2.1 Exposure to Surface Water

The U.S. Environmental Protection Agency (USEPA) *Guidance for Performing Preliminary Assessments under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)* (1991) requires the identification of potential surface water receptors up to 15 miles downstream from the location at which potential MCOC may move beyond the aerial extents of the source area. Only those surface water receptors identified in the surface water pathway segments downstream of the operational range source area are being evaluated and assessed.

Dermal contact and incidental ingestion of MCOC by human receptors within the off-range surface water pathway, for areas other than designated recreational areas (or areas known or suspected of being used frequently for swimming), are programmatically excluded. While surface water may be a viable exposure pathway in some instances, it is not expected to be significant in most cases due to the extremely low levels of MCOC that have been found in surface water during previous quantitative range studies conducted by the U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM). Therefore, USACHPPM has recommended that this pathway only be evaluated when there is evidence that the surface water body is used regularly for swimming (2005).

2.2.2 Exposure to Groundwater

For human receptors to contact MCOC through the groundwater pathway, there must be an aquifer, a drinking water well, or discharge to a stream or spring that is used as a drinking water source. The USEPA (1991) requires the identification of water wells, both public and private, within four miles down gradient of the potential MCOC source area. For the Phase I Assessments, wells are identified within four miles of the potential MCOC source area boundary.

2.2.3 Surface Soil

The surface soil pathway is not to be evaluated unless potential off-range human or ecological receptors are present within 200 feet of a suspected source of MCOC. This determination is based on USEPA guidance (1991). In general, the results of a variety of range studies indicate that the likelihood of encountering potential source-receptor interactions through the soil pathway is extremely low. Also, while it is generally acknowledged that dermal absorption of substances in surface soil may be occurring in terrestrial ecological receptors, the methodology for quantifying this pathway is not currently available. Therefore, although the surface soil pathway may be complete, it is not evaluated by convention, as indicated in the conceptual site model (CSM) figures in Section 5.

2.2.4 Air Emissions

Air emissions from detonating military munitions have been evaluated under a variety of studies conducted by the DoD, the Army, and the Emergency Planning and Community Right-to-Know Act's Toxic Release Inventory and for Agency for Toxic Substances and Disease Registry purposes. These studies indicate that off-range receptor exposure to MCOC via the air pathway does not pose an unacceptable level of risk. Therefore, the USAEC has decided on a programmatic basis not to evaluate the air emissions migration pathway further during the Phase I Assessment. Should additional information become available that identifies potential problems associated with the air emissions migration pathway, this decision will be re-evaluated.

2.2.5 Potential Receptors

Receptors are organisms (human or ecological) that contact a chemical or physical agent in the environment. For the purposes of the Phase I Assessment, receptors are generally limited to off-range human receptors (workers, residents, and recreational users [including trespassers]) and off-range ecological receptors (threatened and endangered species, wetlands, fisheries, and other ecological receptors of concern or sensitive environments specific to an installation). Ecological receptors should include the identification and location of sensitive terrestrial/avian environments within one-half mile of the potential source areas and fisheries and surface water sensitive environments up to 15 miles downstream of the probable point of entry (USACHPPM, 2005; Malcolm Pirnie, 2005). For the purposes of the Phase I Assessments, sensitive environments are considered surrogates for ecological receptors. Guidance on identifying a sensitive environment was obtained from Exhibit 1-1 of the USEPA guidance (1997).

2.2.5.1 Consumption of Ecological Receptors

Studies conducted by the USACHPPM and other organizations indicate that the uptake and bioaccumulation of select MCOC (e.g., explosives) in terrestrial receptors do not pose a viable health risk to off-range receptors. Therefore, without a viable health risk (source), a potential source-receptor interaction pathway associated with the consumption of terrestrial receptors (e.g., deer) becomes irrelevant and is excluded from the ORAP.

These studies also show that deer and other wildlife species exposed to higher levels of MCOC in soil, including areas around explosive manufacturing areas, do not contain detectable levels of military unique compounds. Based on the data gathered during these studies, and considering the conservatism related to the risk assessment process, the health risk associated with consuming deer and other game harvested off-range is no greater than with harvesting game on-range. Therefore, deer, other wildlife, and even livestock are programmatically excluded.

The inclusion of fish as a potential pathway / exposure point via the food chain is supported by

USACHPPM. This assumption is based on the theory that if MCOC are present in a water body, fish have a more intensive, long-term exposure potential than terrestrial receptors, which may only come into contact with the contamination during incidental, short-term exposures.

2.3 Summary of Data Collection Efforts

Four primary sources of information were researched as part of the data collection effort for the Phase I Assessment:

- DoD data repositories and databases (e.g., ARID-GEO, Technical Information Center, Range Facility Management Support System [RFMSS])
- Off-installation / publicly available data repositories and databases (e.g., South Carolina Department of Health and Environmental Control geographic information system [GIS] database)
- Installation data repositories and databases (e.g., Directorate of Plans, Training, Mobilization, and Security [DPTMS], Environmental and Natural Resources Division [ENRD], Integrated Training Area Management)
- Personnel interviews and windshield tour (e.g., RFMSS Administrator, Installation Restoration Program [IRP] Manager, DPTMS Chief)

Prior to the site visit, information on Fort Jackson and the surrounding area was obtained from centralized databases and assembled into several profiles. Data gaps regarding military munitions usage and off-range receptors were identified during this effort. A site visit to Fort Jackson was conducted from 10 October 2006 to 13 October 2006 to confirm/verify the previously collected information and to fill data gaps. RFMSS data on munitions usage for 1 January 2002 to 12 October 2006 were obtained, along with a wide variety of documents on off-range receptors. Interviews with Fort Jackson personnel, including SCARNG personnel based at the McCrady Training Center, also provided useful information (see **Appendix B**). All of this information was used to construct the CSM profiles and figures presented in Section 3 and Section 5, respectively.

Appendix B provides a complete list of references used throughout the Phase I Assessment.

3.0 Conceptual Site Model Profiles

Section 3 provides a description of the installation and its environment based on information obtained during the Phase I Assessment process. The section includes five profile types:

- Facility Profile: Describes man-made features and potential sources (for example, the current and historical installation area/layout and the munitions type/usage and MCOC associated with the operational range area).
- Physical Profile: Describes physical features/factors that may affect release, transport, and access of potential MCOC (for example, meteorological data, topography, geology, hydrogeology, and surface waters and water resource use) and associated MCOC release mechanisms / pathways.
- Munitions Release / Migration Profile: Describes potential release mechanisms and migration pathways based on the source and type of potential MCOC and their interaction with the physical environment.
- Land Use and Human Receptor Profile: Provides information used to identify and evaluate the applicable exposure scenarios, human receptors, and receptor locations.
- Ecological Profile: Describes natural habitats of the installation and associated ecological receptors.

3.1 Facility Profile

3.1.1 Current and Historical Range Usage and Layout

Fort Jackson occupies approximately 36,971 acres in Richland County, SC, excluding the portion licensed to SCARNG. The installation has been incorporated into the eastern section of the city of Columbia, SC. **Figure 1-1** illustrates the general location of Fort Jackson.

According to ARID-GEO (2006), the U.S. Army Training Center currently operates 104 ranges at Fort Jackson, encompassing 29,717 acres (**Figure 1-2**). Areas not currently associated with operational training activities include the cantonment area (which is situated in the southwest portion of the installation), inactive or closed ranges, and other nontraining land assets. The other than operational land area comprises approximately 7,496 acres (ARID-GEO, 2006). During data collection for this report, it was determined that several of the ranges overlap one another, resulting in an actual 29,475 operational acres. This is explained in further detail in Section 5.4.

Table 3-1 presents the general types of ranges currently utilized at Fort Jackson according to ARID-GEO (2006). The number of ranges and total acreage per range type is also provided.

Table 3-1: Fort Jackson Operational Ranges

Range Type	Number of Ranges	Total Acreage
Mortar range	2	135.85
Tank stationary gun range	1	19.41
Non-live grenade range	1	89.47
Demolition/flame range	2	262.78
Fire and movement range	2	272.31
Squad defense range	2	112.57
Field firing range	1	41.02
Record firing range	5	222.97
Night firing range	2	7.13
Known distance range	2	32.41
Infiltration course	1	1.57
Zero range	5	42.36
Miscellaneous range	4	142.72
Confidence/obstacle course	3	12.44
Bayonet assault course	2	6.65
Light maneuver/training area	5	858.47
Heavy maneuver/training area	1	276.06
Miscellaneous training area	61	17,535.52
Dudded impact area	1	5429.32
Non-dudded impact area	1	4215.55
Total	*104*	*29,716.58*

Source: ARID-GEO (2006)

Many of the operational ranges at Fort Jackson have seen significant historical use. Historical military munitions use at Fort Jackson has been documented through the review of historical range mapping. **Figures 3-1**, **3-2**, **3-3**, and **3-4** illustrate historical munitions usage from the years 1949, 1952, 1956, and 1969, respectively. As shown in **Figure 3-1**, several portions of Fort Jackson along the installation's northeast and southern peripheries that are currently field and maneuver training areas were used for munitions related training in the 1940s. **Figure 3-2** shows a north impact area and a south impact area that were defined in the early 1950s. The historical south impact area is now overlapped by a large dudded impact area. **Figure 3-3** shows range fans from 73 historical ranges utilized in the 1950s (including those on the McCrady Training Center), illustrating that military munitions usage occurred over much of Fort Jackson, with the exception of an area in the northwest portion of the installation. **Figure 3-4**, a 1969 map, shows a layout of training ranges similar to what exists today, including the non-dudded impact area in the western portion of the installation.

The operational ranges at Fort Jackson operated by the U.S. Army Training Center are discussed below according to range type. Historical munitions usage, known or suspected dudded areas, and locations of artillery firing points are also included for areas where limited or no munitions are currently used to determine potential source areas. Range types are shown in **Figure 3-5**.

Firing Ranges
The U.S. Army Training Center operates eight firing ranges at Fort Jackson, totaling approximately 362 acres. These ranges include all medium and large caliber firing ranges identified in ARID-GEO (2006), as well as several additional medium and large caliber firing ranges identified using RFMSS data. Small caliber munitions, pyrotechnics/obscurants, and munitions identified as other or unknown are also utilized at some of these ranges.

Small Arms Ranges
The U.S. Army Training Center operates 19 small arms ranges at Fort Jackson comprising approximately 501 acres. Seventeen of these are located along the perimeter of a 4,216-acre impact area in the western portion of Fort Jackson's operational range area, as shown in **Figure 3-5**. In addition to small caliber munitions, pyrotechnics/obscurants and munitions identified as other or unknown are also utilized at some of these ranges.

Training Areas
Seventy-five training areas covering approximately 18,968 acres are present within the portion of Fort Jackson not licensed to the SCARNG for training. Twenty-five of these, totaling 5,446 acres, are non-live-fire maneuver and training areas or obstacle courses where limited or no current or historical munitions usage has occurred. Historical munitions usage was identified at 33 training areas. Fifteen training areas contain artillery or mortar firing points and/or known or suspected dudded areas, as shown in **Figure 3-5**. The remaining two training areas are entirely overlapped by firing ranges; therefore, their acreages have not been included.

Historical munitions usage has occurred in 33 of the training areas, comprising 9,204 acres, as shown in **Figure 3-5**. These areas have historical overlapping range fans used for small arms, medium caliber, large caliber, and additional unidentified historical military munitions training. Based on information from Fort Jackson's range control office, a surface removal action has been performed over these training areas; therefore, there is a low probability of encountering unexploded ordnance (UXO) items. **Figure 3-5** shows heavy historical munitions usage over five of these training areas that contain historical artillery impact areas or areas that have received heavy and recent historical use.

A total of 12 training areas, totaling 3,324 acres, contain known or suspected dudded areas identified by Fort Jackson range control, as shown in **Figure 3-5**. These areas are the result of historical training activities, primarily mortar and grenade firing ranges. These areas are clearly demarcated on Fort Jackson's Installation Field Map (Fort Jackson ITAM, 2006). Signs are posted to alert personnel to the potential presence of UXO. Five of these training areas, plus three other training areas, contain mortar or artillery firing points.

Impact Areas
Two impact areas are present at Fort Jackson, including a large, dudded area in the eastern portion of Fort Jackson comprising 5,429 acres and a slightly smaller area in the western portion comprising 4,216 acres.

The dudded eastern impact area is the established impact area for mortar and artillery weaponry training. It contains range safety fans for a number of small, medium, and large caliber firing ranges located around the perimeter of the area and includes an Engineer Demolition Site. Roads along the perimeter of this area are routinely patrolled by security vehicles, and access is strictly limited. As shown in **Figure 3-2**, this area historically was known as the south impact area and was used as an

impact zone for a number of large caliber training ranges. No surface clearance activities have been performed at the eastern dudded area.

The 4,216-acre area is mostly non-dudded and is surrounded by 19 permanent small arms ranges (two of which are licensed to the SCARNG for training purposes), as shown in **Figure 3-5**. This impact area contains the safety fans associated with each of the 19 small arms ranges. The safety fans encompass more land than that which is actually impacted because about 90% of the rounds fired are contained by berms constructed 30-320 meters down range from firing lines; however, not all of the ranges are bermed (Fort Jackson DPTMS, 2006). **Table 3-1** shows that this entire impact area is defined as non-dudded impact area in ARID-GEO (2006); however, Fort Jackson's range control personnel have identified known dudded areas to be present in the western portion. This is consistent with historical locations of mortar ranges as shown in **Figure 3-4**. The dudded portion of the western impact area covers 273 acres and is shown in **Figure 3-5**.

3.1.2 Munitions Types and Usage

Munitions Types

Each of the following munitions classes has been historically and/or is currently used at Fort Jackson:

- **Small caliber munitions**: These are used in small arms, which typically have a muzzle diameter of up to .50-caliber or 0.5 inches. Projectiles are typically solid and composed of lead cores with copper alloy jackets. Small caliber practice munitions (commonly referred to as blanks) contain no projectile. Additionally, in an attempt to reduce lead usage, a number of installations have replaced traditional bullets with lead-free tungsten composite rounds. According to RFMSS data, tungsten-nylon small arms round have been used at Fort Jackson, with the period of heaviest use taking place in 2003 and 2004.
- **Medium and large caliber munitions**: These are used in weapons systems that employ projectiles larger than .50-caliber, with sizes ranging from 20 to 60 millimeters (mm) for medium caliber and greater than 60 mm for large caliber. These projectiles are typically comprised of hollow iron alloys that contain a detonator and an explosive charge. These munitions may be live, practice, or inert.
- **Pyrotechnics and obscurants**: These devices give off smoke, light, heat, and/or noise when activated. Common munitions in this category include smoke grenades, artillery simulators, ground burst simulators, hand grenade simulators, and booby trap simulators.
- **Other weapons systems:** Hand grenades, bombs, rockets, missiles, and mines all fall into this category. Generally, these munitions may be found at live-fire ranges or impact areas. Items such as detonation cords and charges may be used in demolition areas. These munitions may be live or practice/inert.

Munitions Usage

Munitions data (e.g., RFMSS) collected during the site visit provide information on the types and number of rounds fired at Fort Jackson since 2002. The estimated number of rounds for each munitions class expended at Fort Jackson from 1 January 2002 to 12 October 2006 is summarized in **Table 3-2**. The munitions expended are presented by range type. This table does not include munitions used in SCARNG training activities in areas licensed to the SCARNG. Approximately 72 million total rounds of military munitions were utilized during this time period. More than 95 percent of these were small arms rounds, including approximately 1.1 million small arms tungsten rounds. Several munitions quantities have been modified to correct RFMSS errors that were confirmed by DPTMS personnel. RFMSS does not show munitions usage for the impact areas because the firing

that was aimed toward these areas took place from the other ranges.

Table 3-2: Fort Jackson Munitions Data Summary

Munitions Type	Live-Fire Rounds	Practice/Blank Rounds	Total Rounds
Firing Ranges			
Small Caliber	12,000,000	580,000	13,000,000
Medium Caliber	190,000	190,000	380,000
Large Caliber	880	0	880
Pyrotechnic/Obscurant	21,000	0	21,000
Other	200,000	330,000	530,000
Unknown[a]	--	--	26,000
Total	**12,000,000**	**1,100,000**	**14,000,000**
Small Arms Ranges			
Small Caliber	56,000,000	1,300,000	57,000,000
Pyrotechnic/Obscurant	13,000	0	13,000
Other	200[b]	130,000	130,000
Unknown[a]	--	--	200,000
Total	**56,000,000**	**1,400,000**	**57,000,000**
Training Areas			
Small Caliber	40,000[b]	840,000[b]	880,000[b]
Medium Caliber	0[b]	0	0[b]
Large Caliber	180	0	180
Pyrotechnic/Obscurant	150	0	150
Other	40	380	420
Unknown[a]	--	--	14,000
Total	**40,000[b]**	**840,000[b]**	**890,000[b]**
All Ranges			
Total	**68,000,000**	**3,300,000**	**72,000,000**

[a]Unknown munitions type indicates an entry of "Not Applicable" in the DoD Identification Code column of the RFMSS data; therefore, the number of rounds cannot be associated with a munitions type (DA, 2000).

[b] Munitions quantity edited to correct RFMSS error identified by Fort Jackson DPTMS personnel.

There are several areas on Fort Jackson where munitions were utilized or disposed that are being addressed under Fort Jackson's Resource Conservation and Recovery Act (RCRA) Part B permit issued by the South Carolina Department of Health and Environmental Control (SCDHEC) in September 1991. Although these areas are potential sources of MCOC, they are not evaluated under the ORAP because they are addressed under the conditions of their permit. Permitted open burn (OB)/open detonation (OD) areas are programmatically excluded from ORAP because the conditions of their permit address potential MCOC migration from these areas. They are briefly described here for informational purposes only.

Inchon Explosive Ordnance Disposal Site

Fort Jackson historically utilized two sites (Wonsan and Inchon) for disposal of explosive ordnance, both by OB and OD. The Wonsan Explosive Ordnance Disposal (EOD) site is located on the portion

of Fort Jackson that is licensed to the SCARNG McCrady Training Center and, thus, is not discussed further in this report. The Inchon EOD site is located on the eastern side of Artillery Road, approximately one mile north of Leesburg Road. The six-acre Inchon EOD site was first used by the 48th EOD Detachment to dispose of unserviceable ammunition in 1973. Use of the site was discontinued in 1981. Disposal consisted of burning small arms ammunition in trenches and detonating larger ordnance in pits. The Inchon EOD site is designated as Solid Waste Management Unit (SWMU) 17 in Fort Jackson's IRP. Field activities to support a RCRA Facility Investigation were conducted in 1991, 1993, 1999, and 2000. Samples were collected from shallow soil, subsurface soil, surface water, sediments, and groundwater and analyzed for a variety of analytes, including explosives and metals. Groundwater concentrations were compared to the National Drinking Water Action Level of 15 parts per billion (ppb) for lead and the 2000 USEPA Region IX Preliminary Remediation Goals for Residential Soil and Tap Water. Soil concentrations were compared to USEPA Ecological Screening Values (ESVs) for surface soil (dated August 1999). Positive detections were noted primarily for metals in soil, including arsenic, barium, cadmium, chromium, and lead. A screening level ecological risk assessment was performed in accordance with USEPA (1997) guidance. This assessment determined that constituents present in the soil and groundwater at the Inchon site do not pose a threat to human health or the environment; however, potential UXO that remains in the soil at the site may pose a safety risk. Additionally, it should be noted that some comparison criteria referenced in this study may be outdated. Fort Jackson is implementing land use controls to prevent access to this site (LAW, 2003; USAEC, 2005).

Old Remagen Impact Range

The Old Remagen Impact Range (SWMU 23) comprises 3.4 acres located in the northern portion of Fort Jackson, north of the cantonment area. This area was used to train troops in the use of hand grenades, including practice and high explosive grenades, until 1979. Several investigations completed at the site included the collection and analysis of surface soil, subsurface soil, groundwater, sediment, and surface water samples. Limited criteria were available for groundwater; however, surface water was compared to the following 1998 criteria: SCDHEC water quality standards for human health and aquatic life and USEPA freshwater surface water screening values for hazardous waste sites. Elevated metals concentrations (i.e., antimony, arsenic, cadmium, chromium, and thallium) were detected in surface soil, subsurface soil, and sediment samples, based on the following comparison criteria: Fort Jackson 2001 background data, May 2001 USEPA Region IX Residential risk based concentrations (RBCs) with a hazard quotient of 0.1, and April 1996 USEPA soil screening levels with dilution factor of one. August 1999 USEPA ESVs were also used as criteria for surface soil only. A screening level ecological risk assessment was performed in accordance with USEPA guidance (1997). This assessment determined that the concentrations of metals present did not pose a risk to site receptors; however, it should be noted that some comparison criteria referenced in this study are outdated. Fort Jackson is planning an interim measure to remove surface debris and soil cover and will implement land use controls as part of a final remedy for the site (Ecology and Environment, 2003; USAEC, 2005).

Old Rocket Launcher and Rifle Grenade Ranges

A historical Rocket Launcher Range and Rifle Grenade Range are located near the northwestern border of the installation and are labeled as Numbers 2 and 3 on a 1956 Training Facilities Map (**Figure 3-3**). A report prepared in 1997 referred to this location as the "Old Rocket Grenade Range (SWMU 24)." The report describes SWMU 24 as a 30-acre area north of Boyden Arbor Road, near the northern border of the installation. Based on this report, the area was used for firing rocket grenades and has been inactive since the 1960s. Review of historical maps indicates that both a Rocket Launcher Range and Rifle Grenade Range were located in this area and that rockets and

grenades were fired. Field activities at SWMU 24 included a UXO clearance and soil sampling. Although several metals were detected in soil, none was present at concentrations exceeding USEPA Region III RBCs for residential soil and no explosives compounds were measured above detection limits. The SCDHEC issued a No Further Action determination for this site in January 1997 (Ecology and Environment, 1997; USAEC, 2005).

3.1.3 Potential MCOC

A majority of Fort Jackson is designated as operational range area, with munitions usage occurring at a number of small, medium, and large caliber live-fire ranges, a non-dudded impact area, and a dudded impact area. Based on a review of the data collected for the Phase I Assessment (e.g., GIS data, RFMSS data, historical range maps, site visit interviews with range and environmental personnel), potential source areas for off-range releases were identified at Fort Jackson. MCOC sampling data for certain portions of the installation were identified during the data collection and reviewed for this Phase I Assessment and are summarized below.

White Phosphorus Wetland Storage Installation Assessment (USACE, 1993)

The U.S. Army Corps of Engineers performed a White Phosphorus Wetland Storage Installation Assessment at Fort Jackson in 1993 to determine whether white phosphorus (WP) was present in areas potentially attractive to wildlife, particularly waterfowl. Sediment samples were collected from 12 locations around Fort Jackson that were deemed most likely to store WP based on historical or current use of WP-containing munitions. Five of the sampling locations were near the eastern dudded impact area, and two locations were near the western impact area (the five other sampling locations were near a recreational area). None of the samples contained WP above the analytical detection limit of 0.00096 milligrams per kilogram (mg/kg) (wet weight). The report concluded that the risk to waterfowl from WP storage in the Fort Jackson wetlands is negligible (USACE, 1993). Additionally, a summary report issued by USACE in 1996 stated that out of 39 samples collected at Fort Jackson, none contained WP levels over 0.00096 mg/kg (USACE, 1996).

Small Arms Ranges Study (Bricka, 2002)

Mississippi State University staff, headed by Dr. R. Mark Bricka, performed a study from 2001 to 2002 to evaluate the potential of off-installation migration of MCOC, particularly metals, from the small arms ranges located around the northern perimeter of the non-dudded impact area in the Gills Creek watershed. This study involved the collection of surface and subsurface soil samples from several ranges, as well as surface water and sediment samples from the creeks that drain the small arms ranges (i.e., Bynum, Rowell, and Mack creeks, which drain into Gills Creek). The data showed that soil containing elevated concentrations of lead is present on the small arms ranges. Also, because the small arms ranges contain sandy soils and are intersected by a network of creeks, the potential for erosive conditions is high, so that lead-contaminated soil was shown to be entering several of the smaller creeks that drain into Gills Creek. The results of the sediment sampling indicated that from Gills Creek, sediment travels into Boyden Arbor Pond, primarily during larger rain events. However, the authors of the study stated that "it is also suspected that little lead is moving off post because of the size of Boyden Arbor Pond and that the sediment lead levels at the discharge end of the pond are quite low." The lead concentration in a sediment sample collected at the discharge end of Boyden Pond was 6.4 mg/kg. Surface water sampling results showed that lead concentrations in all of the filtered water samples (total of 57 samples at 17 stream transect locations) and all but 10 of the unfiltered samples (total of 56 samples at 17 stream transect locations) were below 0.065 milligrams per liter (mg/L), the federal water quality Criterion Maximum Concentration (CMC). The CMC is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed briefly without resulting in an unacceptable effect.

To determine whether MCOC are migrating off-range, data must be compared to the Criterion Continuous Concentration (CCC), which is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed indefinitely without resulting in an unacceptable effect. The USEPA mandates that the CCC for lead is 0.0025 mg/L using a hardness of 100 mg/L. The appropriate CCC at Fort Jackson would vary throughout the installation, based on hardness values ranging from 10 mg/L to over 100 mg/L (USATC, 2006). According to Dr. Bricka, the detection limit used for lead in this study was approximately 0.010 mg/L, which is above the CCC for lead. Because detection limits do not allow for a comparison to chronic criteria, this study does not rule out off-range migration of metals MCOC from the small arms ranges in the Gills Creek watershed. However, it does show that lead levels downstream from these ranges are substantially lower than in adjacent water bodies.

Small Arms Ranges Study (USATC, 2005)

The U.S. Army Aberdeen Test Center also performed a study to evaluate the potential of off-installation migration of MCOC, particularly metals, from the small arms ranges located around the northern perimeter of the non-dudded impact area in the Gills Creek watershed. This study involved a watershed-based assessment of the small arms ranges. The study included the installation of three shallow groundwater monitoring wells (MW-1, MW-2, and MW-3) at a small arms range to depths of approximately 13.5 to 14.5 feet below ground surface (bgs). Dissolved lead results from MW-1 were as high as 2,900 ppb, while maximum dissolved lead results from MW-2 and MW-3 were 6 ppb and 30 ppb, respectively. The core sections for MW-1 showed a sandy profile, while cores for MW-2 and MW-3 indicated that there is a localized confining condition (i.e., clay lens) that prevents direct communication between the ground surface and groundwater. Groundwater samples were also collected from two potable water supply wells located near the small arms ranges. These wells are screened in the Middendorf Formation at depths of 174 feet bgs and 105 feet bgs. Lead concentrations for groundwater samples from both of the wells were lower than the 15 ppb lead National Drinking Water Action Level.

The study authors noted that there was visual evidence of significant soil erosion and sediment transport from the impact berms on many ranges. Analytical results from three rounds of ambient surface water sampling suggest that the range areas were contributing to low-level lead concentrations in ambient surface waters adjacent to the range areas. Storm water grab sampling suggest that storm water discharge to the creeks is also increasing lead levels in each creek. However, each subwatershed creek flows through marshy areas before discharging into Gills Creek, which is characterized as a heavily vegetated, marshy area. Gills Creek then flows through Boyden Arbor Pond prior to flowing off the installation. These two environments (marsh and pond) act as natural filters to slow down and trap sediments by a decrease in water velocity and a subsequent decrease in the water's ability to carry sediment loads, as well as by the large amount of organic matter in the marshes that may bind or adsorb metals in runoff waters. According to the study authors, "…there are filtering mechanisms in place at Fort Jackson that are mitigating lead and total suspended solids concentrations in storm water runoff flowing from the small arms range area in the Gills Creek watershed." Regarding groundwater impacts, the study concludes that they are limited to the shallow base flow discharging to the creeks.

Table 3-3 summarizes the potential MCOC (if identified) associated with each of the range types described in Section 3.1.1. **Table 3-3** also lists potential MCOC from historical munitions usage at Fort Jackson.

Table 3-3: Potential MCOC (Current and Historical) at Fort Jackson

Range Type	Source Area / Munitions Types	Potential MCOC	Detected MCOC
Firing Ranges	Squad defense ranges, convoy live-fire ranges, hand grenade ranges, tank stationary gun ranges, demolition range, and artillery firing points	Cyclotrimethylenetrinitra-mine (RDX), 2,4-dinitrotolulene (DNT), 2,6-DNT, pentaerythritoltetranitrate (PETN), nitroglycerine, lead, antimony, copper, zinc, and tungsten	No sample results available
Small Arms Ranges	19 small arms ranges	Nitroglycerine, lead, antimony, copper, zinc, and tungsten,	Lead detected in soil, surficial groundwater, sediments, and surface water on ranges in Gills Creek watershed (Bricka, 2002; USATC, 2005)
Training Areas	Artillery firing points and areas currently used for maneuver / field training that fall within historical range fans for small, medium, and large caliber training ranges	RDX, 2,4-DNT, 2,6-DNT, PETN, nitroglycerine, lead, antimony, copper, and zinc	No sample results available
	Known or suspected dudded areas resulting from historical training activities involving primarily mortar and grenade firing	Trinitrotoluene (TNT), RDX, Cyclotetramethylenetetra-nitramine (HMX), 2,4-DNT, 2,6-DNT, PETN, and perchlorate	
	Areas with no historical source and with limited or no current munitions usage	None	
Impact Areas	The eastern dudded impact area, as well as a smaller known dudded area related to historical munitions usage within what is currently used as a non-dudded impact area	TNT, RDX, HMX, 2,4-DNT, 2,6-DNT, PETN, and perchlorate	No sample results available

Explosives MCOC are listed as a concern in dudded impact areas and known or suspected portions of training areas based on the historical use of these areas as artillery impact areas. Since most

explosives are consumed when ordnance properly detonates, the primary source of MCOC in dudded areas is from UXO and low-order detonations. UXO may occur if a fired munitions item fails to detonate. Explosives contamination from intact UXO results from corrosion or deterioration of UXO items over time. Incomplete detonation or breakup of the delivery system without detonation may also occur, leading to the survival of part or all of the explosive (USACE, 1999). These explosives may be scattered over the firing range as free product or partially encased in the remains of the delivery system (USACE, 1999).

A prioritized list of munitions containing perchlorate has been developed by USAEC and USACHPPM (2005). These munitions account for 96 percent of the U.S. Army's annual perchlorate expenditures. A review of available munitions data from RFMSS indicated that these munitions have been used in significant quantities during training activities; therefore, perchlorate has been included in the list of potential MCOC evaluated for Fort Jackson.

3.2 Physical Profile

3.2.1 Meteorology

Fort Jackson has a temperate continental climate with hot, humid summers and mild winters. This southern temperate region can experience temperatures ranging from below freezing to greater than 100 degrees Fahrenheit (ºF); however, there is a relatively narrow annual temperature range, from a mean daily temperature of 81ºF in July to 44ºF in January (Gene Stout & Associates, 2004). Annual precipitation is approximately 46 inches. July and August are the wettest months with approximately 5.5 inches of precipitation each month. Tropical storms producing heavy rainfall occasionally occur during late summer and early autumn. Wind speeds peak at approximately nine miles per hour in spring, and the general wind direction is from the southwest. Snowfall is rare and generally results in little, if any, accumulation (USATHAMA, 1980).

3.2.2 Topography

Gently to moderately rolling, moderately dissected high plains occupy most of Fort Jackson. These high plains are interrupted by the nearly flat alluvial plains of Gills, Cedar, and Colonels creeks and their tributaries and an irregularly distributed, gently sloping, low relief area in the central portion of the installation near the headwaters of Cedar Creek. Local relief in the high plains is largely 165-250 feet. Slopes are predominately three to eight percent; however, along narrow stream valleys, slopes commonly exceed 15 percent. Elevations in the high plains are mostly 295-459 feet above sea level. The lowest elevation in the high plains is about 200 feet, adjacent to the alluvial plain of Colonels Creek in the eastern portion of the installation. The highest elevation, 540 feet, is at Weir Tower in the west-central portion of the installation (Gene Stout & Associates, 2004).

Flat to gently rolling low plains characterize the extreme western portion of the installation, including a major portion of the cantonment area and the alluvial plains occupied by southwesterly flowing Gills and Mill creeks. Local relief around the valley of Gills Creek and its tributaries is generally less than 60 feet. Slopes are predominately between zero and three percent on the alluvial plains, and slopes in the cantonment area are predominately between three and eight percent. Upper valleys of Mill and Cedar creeks occupy low plains along the southern boundary of Fort Jackson. Local relief is generally less than 40 feet, and slopes are usually less than three percent (Gene Stout & Associates, 2004).

3.2.3 Geology

The geology of South Carolina is characterized by two principal physiographic and geologic provinces, the crystalline rocks of the Piedmont physiographic province and the unconsolidated sediments of the Coastal Plain. The boundary between the Piedmont and the Coastal Plain is marked by the Fall Line, which occurs approximately four miles west of Fort Jackson's cantonment area (USATHAMA, 1980; Newcome, 2003). Fort Jackson lies on the northwestern edge of the Coastal Plain province, a region of low to moderate relief and gently rolling plains, known as the Sand Hills. The principle geologic unit in the Sand Hills is the Upper Cretaceous-age Tuscaloosa Formation (also referred to as the Middendorf Formation), which outcrops over most of Fort Jackson and consists of marine deposits of light-colored sands and kaolin clays. Most soils at Fort Jackson are formed from sediment of the Tuscaloosa. A layer of Quaternary sand terrace overlies the Tuscaloosa Formation, which lies unconformably on the peneplained surface of crystalline rocks (Gene Stout & Associates, 2004). The Tuscaloosa complex generally consists of clay strata overlying unconsolidated sands and extends to depths of 90 to 300 feet bgs (USATHAMA, 1980). In the northwestern portions of Fort Jackson, Pleistocene sands and gravel are present at the ground surface (Gene Stout & Associates, 2004).

3.2.4 Hydrogeology

The Tuscaloosa Formation consists of interbedded, generally unconsolidated, fine to coarse sand and clay, causing groundwater to occur under both unconfined and confined (i.e., artesian) conditions. Groundwater occurs under water table conditions in the upper part of the zone of saturation. At a depth of about 99 to 251 feet, permeable sand zones are frequently overlain by less permeable clay zones, and the groundwater exists under artesian conditions (Gene Stout & Associates, 2004). At some places, a perched water table condition exists due to clay and sandy clay layers, which underlie the sands at many places (USATHAMA, 1980). The vertical migration of groundwater may be limited in some areas by the presence of a perched water table. There is extensive communication between surficial groundwater and surface water, as the shallow, perched aquifer discharges as base flow into the network of small creeks that run through much of the operational range area at Fort Jackson. Surficial groundwater flow at Fort Jackson generally follows the surface water flow, as shown in **Figure 3-6**. Static water levels measured on the west side of the installation (i.e., the cantonment area) generally range from two to 20 feet bgs (USATHAMA, 1980). The maximum depth to the water table occurs in the interstream areas near the central part of the installation, where static water levels exceed 100 feet bgs (LAW, 2003).

Aquifers southeast of the Fall Line, discussed in Section 3.2.3, include Upper Cretaceous and Tertiary formations (South Carolina Department of Natural Resources [SCDNR], 2003). The primary groundwater resources for water supply wells in Richland County, SC, are the Cretaceous Middendorf and Black Creek formations (SCDNR, 2003). The deep regional aquifer at Fort Jackson occurs in the basal Middendorf sand formation. Regional groundwater movement arcs in a south to southeasterly direction across Fort Jackson toward two major discharge points, the Congaree River to the south and southwest and the Wateree River to the east (Newcome, 2003). Regional groundwater flow is shown in **Figure 3-7**. Although Fort Jackson is not located within a recharge area for a sole-source aquifer, it is within the recharge area for an aquifer that is widely used for drinking water (Gene Stout & Associates, 2004). According to the SCDNR, approximately 600 groundwater wells were completed in sand beds of the Cretaceous and overlying formations from 2001 to 2002 (SCDNR, 2003). SCDHEC references confirm that South Carolina's major drinking water aquifers are in the subsurface of the Coastal Plain (SCDHEC, 2006).

3.2.5 Soils

Four major soil types are present at Fort Jackson: Lakeland, Vaucluse-Ailey-Pelion, Fuquay-Troup-Vaucluse, and Pelion-Johnson-Vaucluse (USATHAMA, 1980). Lakeland soils are the predominant soil type at Fort Jackson and are found at higher elevations in the central part of Fort Jackson along ridgetops (Gene Stout & Associates, 2004). They consist of deep, gently to strongly sloping, and highly permeable sandy soils. Vaucluse-Ailey-Pelion soils are found along the Colonels Creek watershed in the east and southeastern portions of Fort Jackson. They consist of well-drained to moderately well-drained soils that have a sandy surface layer and a loamy subsoil. Fuquay-Troup-Vaucluse soils are found along Mill Creek and Cedar Creek in two small areas along the southern installation boundary. They consist of well-drained soils with sandy surface and subsurface layers and a loamy subsoil. Pelion-Johnson-Vaucluse soils are found on the western portion of Fort Jackson along the Gills Creek watershed. They consist of moderately well-drained soils that have a sandy surface layer and a loamy subsoil, very poorly drained soils that are loamy throughout, and well-drained soils that have a sandy surface layer and a fragipan in the loamy subsoil (USATHAMA, 1980; Gene Stout & Associates, 2004). The high sand content of soils at Fort Jackson promotes leaching of minerals, reduced water retention, and increases susceptibility to soil erosion (USATC, 2005).

3.2.6 Surface Water

Fort Jackson is located within the Santee River Basin and the Congaree River subbasin. Fort Jackson encompasses five watersheds or subwatersheds, as shown in **Figure 3-8**. These watersheds are drained by Colonels, Gills, Wildcat, Mill, and Cedar creeks described below.

Colonels Creek Watershed
The headwaters of Colonels Creek originate on Fort Jackson. This is a predominately wooded watershed. Colonels Creek drains the eastern portion of the installation, including the area licensed to the SCARNG McCrady Training Center, and flows southeast to the Wateree River, a tributary of the Congaree River.

Gills Creek Watershed
Gills Creek, in the northwest portion of Fort Jackson, drains the small arms ranges and western impact area, as well as non-live-fire training areas. Gills Creek is primarily an urban watershed that has been identified as being very polluted. These pollutants are typical of pollutants found in urban settings: petroleum products, oil and grease, sediments, trash, and sewage. However, a large portion of the Gills Creek watershed on Fort Jackson is relatively pristine when compared to that portion in the more urbanized city of Columbia (Gene Stout & Associates, 2004; SCDHEC, 1997).

Wildcat Creek Watershed
Wildcat Creek drains a small portion of the cantonment area and flows to the west, where it enters Gills Creek just below Lake Katherine. None of the operational range areas are drained by Wildcat Creek.

Mill Creek Watershed
Mill Creek drains an area in the southwest portion of the training areas and flows off-post to the south, where it eventually enters the Congaree River. The Mill Creek watershed encompasses a small area in the southern portion of the non-dudded impact area (including two small arms ranges), wooded training areas, and the Twin Lakes recreational area located on-post.

Cedar Creek Watershed

Cedar Creek drains the majority of a large dudded impact area and flows southward through the Weston Lake Recreation Area, eventually entering the Congaree River.

There are 26 lakes, ponds, and impoundments on Fort Jackson. These water bodies range in size from 0.5 to 173 acres; however, most are less than 35 acres. Five ponds and two lakes are adequate for intensive fisheries management (Old Heises Pond, South Pond, Upper Barstow Pond, Lower Barstow Pond, Odom Pond, Upper Legion Lake, and Big Twin Lake). Remaining lakes and ponds are maintained for waterfowl habitat, recreation, aesthetics, and irrigation water supply for golf courses. The largest lake, Weston Lake, is north of Leesburg Road east of the cantonment area. The lake has a surface area of about 173 acres and accounts for more than one-third of the total impounded surface acreage for the installation. Weston Lake is also the installation's primary waterside recreation lake, with camping facilities, picnic shelters, a community house, a beach pavilion, and a swimming area (Gene Stout & Associates, 2004).

All creeks and streams leaving Fort Jackson eventually flow into either the Wateree River or the Congaree River (**Figure 3-9**). These rivers meet about 16 miles southeast of Fort Jackson, where they form the Santee River, the principal stream of the region. The Santee River continues in a southeasterly direction, eventually emptying into the Atlantic Ocean south of Georgetown, South Carolina (Gene Stout & Associates, 2004).

3.2.7 Vegetation

In general, Fort Jackson can be classified into five primary terrestrial vegetative types: pine, pine/upland hardwood, upland hardwood, bottomland hardwood, and open field. There are no grassland areas on Fort Jackson, except for a small amount in the cantonment area and alongside roads. Vegetation on Fort Jackson is diverse and abundant. Field investigations and surveys have identified over 750 species of flora on the installation. Forest cover is the principal vegetative type and may be grouped into eight major forest types: Natural Pine, Pine Plantation, Pine Scrub Oak, Pine Hardwood, Scrub Oak, Upland Hardwood, Bottomland Hardwood, and Hardwood Pine. Natural Pine is the most important forest type on the installation and includes all natural pine stands, regardless of species, in which less than 20 percent of the basal area of overstory trees is hardwoods or less than 20 percent of the basal area is dominated by scrub oak (Gene Stout & Associates, 2004).

As observed during the site visit, forested areas occupy the majority of the installation, with the exception of the firing ranges and the cantonment area. The dudded and non-dudded impact areas in the center of the installation, as well as the training areas along the outskirts of the installation, are mostly covered with thick vegetation consisting of mature pines and scrub oaks. There are, however, several sandy areas that are not vegetated and that are prone to erosion. These areas have been surveyed by personnel in Fort Jackson's ENRD and are shown in **Figure 3-10**.

3.3 Munitions Release / Migration Profile

Surface water moving off-range provides a possible migration pathway for MCOC. As described in Section 3.2.6, there are five watersheds delineated on Fort Jackson. These watershed drainage areas provide potential avenues for MCOC to migrate off-range via surface water and sediment, as shown in **Figure 3-8**. Receptor interactions are considered up to 15 miles from where these surface water courses exit operational range area, based on guidance developed by the USEPA for the CERCLA Preliminary Assessments (**Figure 3-9**).

At Fort Jackson, groundwater in the shallow, perched aquifer has been identified as a potential pathway for MCOC to migrate off-range. There is an extensive network of creeks and ditches throughout the operational area. Surface water in these creeks provides recharge and receives discharge from surficial groundwater. Surficial groundwater also provides recharge. Localized confining conditions (i.e., clay lenses) may retard communication between the ground surface and groundwater in some areas, limiting the off-range migration of MCOC.

MCOC from source areas, as described in **Table 3-3,** potentially impact source media, including soil (e.g., found in impact berms, firing points, and dudded, as well as non-dudded, impact areas) and surface water / sediment (e.g., via erosional deposition into streams and/or wetlands).

MCOC can be released to groundwater (down gradient), surface water / sediment (downstream), off-range soil, or the food chain via a variety of release mechanisms. Release mechanisms for soil may include leaching from soil to groundwater or erosion and runoff to off-range surface soil or to nearby streams. Once potential MCOC are deposited in surface water / sediment, they have the potential to migrate downstream or be taken up by aquatic plants or animals.

3.4 Land Use and Human Receptor Profile

3.4.1 Current Land Use

The vast majority of land comprising Fort Jackson is used for training activities, including live-fire and non-live-fire ranges and impact areas. There is a cantonment area located in the southwestern portion of the installation. The cantonment area supports a wide variety of land uses (e.g., housing, recreational, commercial, education, healthcare) that comprise the elements necessary for a functional community. The cantonment area is surrounded on the north and east by reserved land and buffer areas, which provide a transitional use to installation range and training areas. The daytime population of Fort Jackson in 2001 was 18,556 persons, consisting of 11,139 students and soldiers in training, 3,575 military personnel, and 3,842 civilians.

The city of Columbia, consisting of highly urbanized developed land, lies to the west and northwest of Fort Jackson. There are a few rural residential and commercial developments immediately south of Fort Jackson adjacent to Leesburg Road. The area surrounding the eastern portion of Fort Jackson is undeveloped and consists of natural woodlands.

3.4.2 Adjoining Areas of Concern

The McCrady Training Center, which covers approximately 15,000 acres of the eastern portion of Fort Jackson, is licensed to the SCARNG for training. The cantonment area of the SCARNG McCrady Training Center is in the southeastern corner on about 517 acres. The remainder of the land is utilized for live-fire and non-live-fire training. Fort Jackson's range control office coordinates training activities for the SCARNG, and all of the medium caliber and large caliber munitions firing from the McCrady Training Center are directed toward the eastern dudded impact area, which is included in the Fort Jackson ORIS.

3.4.3 Current Human Receptors

Potential human receptors include residents (in on-installation housing and in nearby off-installation residential areas), workers (on-installation and in off-installation areas surrounding the installation), and hunters, fishermen and swimmers utilizing on-installation or nearby off-installation areas for recreational purposes. Potential human receptors include the following:

- Residential and commercial/industrial communities within four miles down gradient of current and historical source areas who utilize groundwater from the surficial aquifer. These receptors are primarily located in communities south of Leesburg Road, southeast of Fort Jackson; however, receptors have also been identified to the west and southwest of Fort Jackson.
- Recreational users of Weston Lake and other on-installation recreational ponds and lakes
- Recreational users who utilize surface water from the designated watershed systems within 15 miles downstream of current and historical source areas

3.4.4 Resource Use Location

Fort Jackson purchases most of its drinking water from the City of Columbia water system, which processes 62 million gallons per day (mgd) from the Broad River at Columbia and Lake Murray on the Saluda River just west of the city. Fort Jackson purchases approximately 2.5 mgd of potable water from the City of Columbia (Newcome, 2003). The installation also operates nine wells that provide water to the training ranges, the ammunition depot, and the Weston Lake Recreation Area (**Figure 3-6**). The depths of these wells range from 105 to 263 feet bgs, and they are screened in the Middendorf Formation (LAW, 2003). Water samples from these wells were analyzed for primary and secondary drinking water maximum contaminant levels (MCLs) by the U.S. Army Environmental Hygiene Agency in 1976 and 1978. The results showed that the groundwater is slightly acidic (pH = 5.1 to 6.2), low in dissolved solids (2.0 to 81.3 mg/L), and has a very low alkalinity and hardness (USATHAMA, 1988). Currently, the water from these wells is monitored routinely by the Fort Jackson Preventive Medicine office for total coliform.

Figure 3-6 depicts the water supply lines and groundwater wells in the vicinity of Fort Jackson. The majority of the communities adjacent to Fort Jackson obtain potable water from the City of Columbia; however, the SCDNR database identifies groundwater wells in these areas, indicating that groundwater may also be used as a potable water source. Residences located along Leesburg Road, near the southeastern installation boundary, utilize groundwater as their source of potable water (LAW, 2003). According to the SCDNR database, domestic wells in the vicinity of Fort Jackson draw from both the surficial aquifer and the Middendorf Formation.

Recreational areas on Fort Jackson are primarily hunting areas and fishing ponds and lakes (i.e., Heise Pond, Twin Lakes, and Weston Lake). Weston Lake is the installation's primary waterside recreation lake, with camping facilities, picnic shelters, a community house, a beach pavilion, and a swimming area.

3.5 Ecological Receptor Profile

3.5.1 Sensitive Environments

Wetlands on Fort Jackson consist primarily of bottomland hardwoods in narrow bands adjacent to streams and drainages. There are some wider areas of forested wetlands along the main branch of Colonels Creek and Gills Creek. Approximately 5,250 acres of wetlands have been inventoried on the installation (Gene Stout & Associates, 2004). In addition, the Integrated Natural Resources Management Plan lists the following significant natural areas on Fort Jackson (Gene Stout & Associates, 2004):

Buffalo Creek Bog

Buffalo Creek Bog on Buffalo Creek (**Figure 3-8**), a tributary of Colonels Creek, is a sandhill seepage bog and the most botanically significant site on Fort Jackson. The site is in the dudded impact area and has been exposed to frequent fires. The unique hydrology of the site, in association with these frequent fires, has produced habitat for a number of rare or uncommon plant species, including the federally listed rough-leaved loosestrife (*Lysimachia asperulaefolia*).

Dupre Pond Headwaters

An unusual system of braided streams and rivulets occurs at the northwestern headwaters of Dupre Pond in a training area near the northern installation boundary (**Figure 3-8**). At the base of the dry north-facing slope, a broad expanse of low trees is dominated by grasses, sedges (especially *Rhynchospora spp.* and *Carex spp*.), and various shrubs, providing habitat to numerous invertebrate species, amphibians, and reptiles.

3.5.2 Habitat Types

Approximately 7,000 acres of the 36,971 acres not licensed to SCARNG comprise the Fort Jackson cantonment area. The majority of the remaining area is used for operational ranges and training areas. Much of the operational training area is forested. Natural pine and pine plantation forest types make up the majority of the forest habitat on the installation. There are 26 lakes, ponds, and impoundments on Fort Jackson. Together, these water bodies cover about 427 acres. Approximately 5,250 acres of wetlands have been inventoried on the installation (Gene Stout & Associates, 2004).

The areas to the southeast and northeast of Fort Jackson are largely undeveloped, consisting of natural pine forest habitat as well as creeks and wetlands areas. Areas to the southwest and northwest are characterized by urban development associated with Columbia, the largest city in South Carolina.

3.5.3 Ecological Receptors

Two federally listed endangered plant species, rough-leaved loosestrife and smooth coneflower (*Echinacea laevigata*), occur on Fort Jackson. Rough-leaved loosestrife is found on the eastern edge of the dudded impact area. Smooth coneflower has been documented adjacent to Statue of Liberty Road on land licensed to the SCARNG. **Figure 3-8** indicates the approximate locations of the two endangered plant species populations. Since these plants are located in narrowly defined areas within the operational training ranges, it is not expected that they would be found at off-installation locations.

One federally listed endangered animal, the red-cockaded woodpecker, is a resident of Fort Jackson. Red-cockaded woodpecker distribution on Fort Jackson is depicted in **Figure 3-8**. Due to the wide presence of the red-cockaded woodpecker on Fort Jackson and the presence of similar habitat off-range and off-installation, it is expected that the red-cockaded woodpecker would be present off-range as well. The American Bald Eagle (*Haliaeetus leucocephalus*), which is listed by the SCDNR as a state endangered species (SCDNR, 2006), is a transient visitor to the installation. No American Bald Eagle nests or permanent roost sites are known to occur on the installation, and it is unlikely that the species nest at Fort Jackson due to unsuitable habitat. Although not currently listed as threatened or endangered, Fort Jackson provides habitat for five rare animal species: the Southern hognose snake (Heterodon simus), American Kestrel (Falco sparverius), Rafinesque's big eared bat (*Plecotus rafinesquii*), loggerhead shrike (*Lanius ludovicianus*), and Bachman's sparrow (*Aimphila aestivalis*).

3.6 Relationship of Potential MCOC Sources to Off-Range Human and Ecological Receptors

As summarized in Table 3-3, potential MCOC sources have been identified at the firing ranges, small arms ranges, and impact areas shown in **Figure 3-5**, as well as at some of the training areas. The following discussion describes the relationship between potential MCOC sources present at a given type of range to off-range human and ecological receptors.

Firing Ranges

The U.S. Army Training Center operates eight medium and large caliber firing ranges at Fort Jackson. These ranges are primarily located around the perimeter of the eastern dudded impact area, but a couple of them are located to the north of the impact area. All of these ranges lie within the Gills Creek, Cedar Creek, or Colonels Creek watersheds.

Two firing ranges occur within the Colonels Creek watershed, a hand grenade range in the western portion of the watershed and a small demolition range within a training area. A large erosional area is present over the central portion of the hand grenade range, and the range is up gradient and within 700 feet of two tributaries of Colonels Creek. The demolition range is approximately one-third mile from a tributary of Colonels Creek and is half covered by an identified erosional area. Based on the proximity to surface water and potential for erosion from each site, it is likely that surficial groundwater and/or overland surface flow or soil erosion mechanisms have the potential to transport MCOC off-range. Surface water receptors may be contacted downstream in ponds and impoundments formed by Colonels Creek (e.g., Murray Pond). Groundwater originating at ranges within the Colonels Creek watershed would have a greater than four-mile pathway to reach off-installation groundwater receptors; therefore, it is unlikely that MCOC in groundwater from these ranges would impact off-range groundwater receptors.

Three firing ranges occur within the Gills Creek watershed, which are all within one-half mile of Rose Creek, a tributary of Bynum Creek. A large percentage of each of these ranges is also covered by identified erosional areas. During the site visit, large patches of bare soil were noted at two of these ranges. Based on the potential for sheet erosion at these ranges and an observed lack of adequate vegetative cover, surficial groundwater and/or overland surface flow or soil erosion mechanisms have the potential to transport MCOC from these ranges to nearby surface water. Once potential MCOC are deposited in surface water / sediment, surface water receptors may be contacted downstream in Forest Lake and Lake Katherine. In addition, the shallow depth to groundwater, especially adjacent to the creeks, implies that groundwater in the surficial aquifer discharges to surface water. If transported off-installation via surface water runoff or through infiltration or leaching into the groundwater, MCOC from the firing ranges within the Gills Creek watershed have the potential to reach private domestic wells located to the west and southwest of Fort Jackson, as shown on **Figure 3-6**.

Three firing ranges are present within the Cedar Creek watershed. Surficial groundwater or overland flow that discharges to surface water has the ability to carry potential MCOC from the firing ranges in the Cedar Creek watershed to Weston Lake. If transported off-installation via surface water runoff or through infiltration or leaching into the groundwater, MCOC from the firing ranges within the Cedar Creek watershed have the potential to reach private domestic wells located to the south of Fort Jackson along Leesburg Road within four miles of source areas.

Small Arms Ranges

The U.S. Army Training Center operates 19 small arms ranges at Fort Jackson. Seventeen of these 19 ranges are located in the western operational range area, situated around the perimeter of a largely non-dudded impact area. Fifteen of the ranges located in the western portion of the installation lie within Gills Creek watershed, and two occur within Mill Creek watershed. The remaining two small arms ranges are situated just north of the eastern dudded impact area, within Colonels Creek watershed.

As discussed in Section 3.1.3, two studies have been performed to evaluate the potential of off-installation migration of metals MCOC from the small arms ranges. The conclusions reached in both of the studies are that surface water and surficial groundwater on the small arms ranges are impacted by lead, but concentrations of metals are drastically reduced by the time they reach off-range areas. These conclusions are supported by routine sampling performed by the SCDHEC for the Gills Creek Non-Point Source Watershed Project (SCDHEC, 1997). The results from this sampling effort are shown in **Table 3-4** below. During this period, surface water lead concentration in the Gills Creek samples did not exceed 50.0 ppb; however, higher lead levels were found in storm water samples collected near the ranges in the Mack, Rowell, and Bynum creek tributaries (**Figure 3-8**).

Table 3-4: Small Arms Range Area Storm Water Sampling Results

Date	Total Lead Concentration (ppb)			
	Gills Creek	Mack Creek	Rowell Creek	Bynum Creek
21 Nov 1994	Not sampled	Not sampled	1,100	Not sampled
23 Jan 1995	< 50	Not sampled	70	Not sampled
8 Mar 1995	Not sampled	360	Not sampled	260
24 Apr 1995	< 50	Not sampled	2,200	Not sampled

Source: SCDHEC, 1997

The report author stated that, "Preliminary sampling has determined that no detectable levels of lead are leaving the military reserve." (SCDHEC, 1997). According to SCDHEC personnel, 50.0 ppb was the state MCL for lead at the time the samples were taken (1994 and 1995) but was not reinstituted in 1998. Human health criteria for lead are currently under review, and this 50.0 ppb MCL is no longer used by SCDHEC; therefore, the conclusion of the studies discussed above and the associated sample results cannot conclusively determine that metals MCOC from the small arms ranges located in the Gills Creek watershed do not pose a risk to off-site receptors. Additionally, samples from this area have not been analyzed for explosive and perchlorate MCOC, which may be subject to different fate and transport mechanisms than metals MCOC.

It should be noted that Fort Jackson has implemented engineering controls to mitigate the transport of soil via storm water runoff from its small arms ranges, and lead levels in surface water have most likely decreased since sampling in 2001. According to Fort Jackson Range Control personnel, a new drainage system was just installed at the small arms range adjacent to Rowell Creek, which is the most heavily used range at Fort Jackson. Berm bullet pocket structural enhancements were installed at the small arms range adjacent to Mack Creek as part of a test study on use of storm water management controls at the small arms ranges (USATC, 2006). Sampling data show reduced storm water runoff concentrations (USATC, 2006). However, sampling data downstream of Fort Jackson's operational range area are not available to confirm the effectiveness of these controls on off-range

lead migration. Therefore, both surface water and surficial groundwater pathways exist for these ranges, which are up gradient from groundwater wells identified by the SCDNR database, as shown on **Figure 3-6**.

There are two small arms ranges located in the southern portion of the non-dudded impact area that lie within the Mill Creek watershed. There is a potential surface water pathway for MCOC from these ranges to Mill Creek, which drains to the Twin Lakes, which are used for recreational fishing and swimming. Threatened and endangered species habitat has been identified in this area. There is also a potentially complete groundwater pathway for MCOC, as groundwater wells have been identified down gradient from these ranges, as depicted on **Figure 3-6**.

Colonels Creek watershed contains two small arms ranges: a large range adjacent to the eastern dudded impact area and a small (1.5-acre) night infiltration course located within a training area just north of the eastern impact area. The larger range is intersected by Buffalo Creek, which drains to Colonels Creek; therefore, surface water containing MCOC from this range has the potential to migrate off-site via Colonels Creek to surface water receptors at Murray Pond. The night infiltration course is directly up gradient from Buffalo Creek, at a slope of approximately five percent (GIS Repository, n.d.). Based on the topography and sandy soil present at the range, MCOC also has the potential to migrate off-site from this range via Colonels Creek. Surficial groundwater that may drain along the Colonels Creek watershed would have a transport pathway of farther than four miles prior to reaching the closest groundwater receptor (i.e., domestic wells located to the south of Fort Jackson along Leesburg Road); therefore, no groundwater receptors are identified for either of these two ranges.

Training Areas

Seventy-five training areas are present within the portion of Fort Jackson not licensed to the SCARNG for training. Little or no historical munitions usage has occurred at 25 of these areas, most of which are located within the Gills Creek watershed with two smaller areas located at the installation's southern boundary in the Mill Creek and Cedar Creek watersheds. It is presumed that there is no MCOC source present in these 25 training areas.

Historical munitions usage was identified at 33 of the remaining 50 training areas. Fifteen training areas contain artillery or mortar firing points and/or known or suspected dudded areas, and two training areas are entirely overlapped by firing ranges. Significant MCOC sources may be present in some of these areas and are discussed below.

Training Areas Containing Historical Munitions Usage Areas

Historical munitions usage occurred within 33 training areas, where overlapping historical range fans for small, medium, and large caliber munitions training were identified. These training areas are located primarily in the northeastern portion of the Fort Jackson operational training area, but there are also several in the southwestern portion of the operational training area. Many of the training areas in the northeast portion of Fort Jackson lie within the Colonels Creek watershed. These areas were mostly designated as safety fans for small arms ranges used from the 1940s to the 1960s. Given that these areas have not been used for munitions training since the 1960s and that most of the use was for small arms training, it is likely that only limited MCOC sources remain in these areas and transport of high concentrations of MCOC is unlikely.

This is supported by surface soil MCOC sampling that was conducted at several closed small arms ranges within the cantonment area at Fort Jackson under the Military Munitions Response Program,

as part of a Site Inspection in April/May 2005 (Malcolm Pirnie, 2006). The small arms ranges include a transition range, a pistol range, and overlapping range fans from 1000-inch and landscape target ranges. These ranges, which encompass approximately 475 acres, were used from the 1940s through the 1970s for small arms training. The firing lines and target areas for the ranges account for a much smaller area (approximately 80 acres). Historical information provided general locations of former range features (e.g., firing lines/lanes, target areas); however, these features are no longer discernable at the sites. A combination of technologies was used to field determine biased sampling locations, including visually confirming historical range feature locations (e.g., firing lines, target areas, backstop berms), locating concentrations of bullet fragments/casings using an all-metals detector and X-Ray Fluorescence screening at potential sampling locations to determine areas of higher lead concentrations. Analytical data indicate that total lead concentrations were detected below the USEPA Region 9 Residential Preliminary Remediation Goal of 400 mg/kg for all 51 surface soil samples collected.

The same assumptions are made for the several training areas that are located in either the Cedar Creek or Mill Creek watersheds, provided that historical maps indicate that usage was limited to primarily small arms. Limited MCOC sources were identified in a total of 28 of the 33 training areas with historical munitions usage.

Historical munitions use at the remaining five training areas is characterized as providing potential sources of MCOC, based on type, frequency, and most recent use. Two training areas located in the central portion of the Colonels Creek watershed historically were utilized as artillery impact areas, which may have resulted in the presence of significant UXO. Although a surface removal action has been performed over these training areas, UXO may still exist in the subsurface if a fired munitions item failed to detonate. Incomplete detonation or breakup of the delivery system without detonation may also occur, leading to the survival of part or all of the explosive (USACE, 1999). Intact UXO may corrode or deteriorate over time, leading to explosive MCOC contamination in these areas. These areas are assumed to potentially contain a greater loading of MCOC than the surrounding areas that were range fans for small arms ranges. Surficial groundwater and/or overland surface flow or soil erosion mechanisms have the potential to transport MCOC from these ranges to a surface water course. Potential off-range receptors have been identified in Murray Pond. No groundwater receptors are identified since the distance to the closest domestic wells exceeds four miles.

Likewise, a greater loading of MCOC is assumed at one training area in the Mill Creek watershed historically used as an impact area for a rocket launch range. Mill Creek traverses this range before it empties into the Twin Lakes, which are used as a recreational area. Red-cockaded woodpecker cavity trees are located along Mill Creek just upstream of Twin Lakes, as shown in **Figure 3-8**. Therefore, it is assumed that a potentially complete surface water pathway exists to human and ecological receptors. Down gradient groundwater receptors have also been identified in the Mill Creek watershed, as shown on **Figure 3-6**.

Two training areas with historical munitions use, one located in the Cedar Creek watershed and the other in the Gills Creek watershed, were used through the 1990s as overlapping mortar and firing ranges. Their recent use and the potential for UXO in these areas suggest a greater loading of MCOC than the areas historically used as small arms ranges or range fans. Surface water and groundwater pathways and receptors are identified for both of these ranges.

Training Areas Containing Artillery/Mortar Firing Points and/or Known or Suspected Dudded Areas

Twelve training areas contain known or suspected dudded areas identified by Fort Jackson range control, and five of these training areas, plus three other training areas, contain mortar or artillery firing points.

As shown in **Figure 3-5**, training areas containing known or suspected dudded areas occur primarily in the northeastern portion of the Fort Jackson operational training area (seven of 12 ranges), with two smaller areas occurring in the southern and northwestern portions of the installation. The large area in the northeast lies in the Colonels Creek watershed. Five of the seven training areas with suspected dudded areas in the Colonels Creek watershed also contain one or more artillery firing points. Surface water and surficial groundwater from this area drain to the southeast through the McCrady Training Center (which is mostly comprised of operational training area) and then off-site. MCOC have the potential to reach off-range surface water human receptors at Murray Pond, as well as threatened and endangered species such as the red-cockaded woodpecker. However, groundwater receptors (i.e., residences along Leesburg Road) are located farther than four miles from the source area assuming that surficial groundwater flows along Colonels Creek.

Two training areas that contain a suspected dudded area are located on the southern installation boundary fall within the Mill Creek watershed, which drains southward. There is a creek located approximately one-third of a mile south of this area, south of the installation boundary. Given generally erosive soil conditions on Fort Jackson and the presence of an uncleared dudded area, it is assumed that there is a potential for MCOC to enter the creek and to migrate south to Lake Rebecca, where human and ecological receptors may be present. Since this area is fairly close to the cantonment area, where groundwater depths are shallow, it is presumed that MCOC have the potential to reach the shallow aquifer in this area. The SCDNR database indicates that some off-post residents located south of this area utilize groundwater wells for potable water; therefore, groundwater receptors are identified for these training areas.

Three training areas contain a suspected dudded training area located in the northwest portion of the installation within the Gills Creek watershed. Surface water and surficial groundwater from this area flow to the west and southwest, toward the Fort Jackson cantonment area. Groundwater receptors are identified for this source area, since groundwater wells have been identified west of the installation. There is also a potential for MCOC to enter Gills Creek and migrate to Forest Lake and Lake Katherine, downstream of Fort Jackson, where human and ecological receptors are present.

Three additional training areas contain only artillery or mortar firing points, and do not contain suspected dudded areas. Two of these training areas are located in the Colonels Creek watershed and one is located in Cedar Creek watershed.

Training Areas Overlapped by Firing Ranges

The two training areas overlapped by firing ranges are considered potential MCOC sources due to munitions use associated with the firing ranges. One of these training areas is located within Gills Creek watershed, and one within Cedar Creek watershed.

Impact Areas

The dudded eastern impact area falls almost entirely within the Cedar Creek watershed, which drains southward to Weston Lake, a popular recreational area. Therefore, overland flow and surface water have the ability to carry potential MCOC from this impact area to Weston Lake. The shallow depth

to groundwater, especially adjacent to creeks, implies that groundwater in the surficial aquifer discharges to surface water. If transported off-installation via surface water runoff or through infiltration or leaching into the groundwater, MCOC have the potential to reach private domestic wells located to the south of Fort Jackson along Leesburg Road within four miles of source areas.

The western impact area lies almost entirely within the Gills Creek watershed. Surface water and surficial groundwater from this area flow to the west and southwest toward the Fort Jackson cantonment area and then off-site to Forest Lake and Lake Katherine. As discussed in Section 3.4.4, potable water in the cantonment area is provided by the city of Columbia; however, groundwater wells have been identified west of the installation. Therefore, groundwater receptors are identified for this source area. Likewise, wells have been identified in areas down gradient of the portion of the impact area located within the Mill Creek watershed. Two detailed studies of MCOC migration from the small arms ranges in the Gills Creek watershed have been performed (see Section 3.1.3) and have demonstrated that metals MCOC from this area do enter local creeks. Sampling data do not conclusively show whether concentrations of metals MCOC migrating off-installation pose a potentially complete pathway to human and ecological receptors downstream. Additionally, the MCOC identified for this area include perchlorate and explosive compounds that may be subject to different transport mechanisms than metals; therefore, a surface water pathway and surface water receptors are also potentially present for this area.

4.0 Grouping and Categorization Methods

4.1 Grouping Rationale

The ARID-GEO (2006) data identified operational ranges within the installation boundaries. The identified operational ranges may contain live- or non-live-fire ranges, firing points, or other training activities. For the purposes of the Phase I Assessment, operational range areas are divided into various groups. Groups are defined by the presence or absence of the three CSM components: source of MCOC, migration pathway, and receptor. The acronym designations for these components are presented below:

Source of MCOC

- **Limited Source (LS)**: Limited or no munitions have been used on-range. No migration pathway or receptor designation is needed for this group.
- **Munitions (M)**: Munitions have been used on-range. This designation is always followed by the applicable pathway designation.

Migration Pathway

- **Pathways Unlikely (PU)**: Migration pathways are unlikely or incomplete. This designation is always preceded by an M signifying munitions have been used on-range.
- **Groundwater (GW)**: A groundwater migration pathway was identified. This designation is always preceded by an M signifying that munitions have been used on-range.
- **Surface Water (SW)**: A surface water migration pathway was identified. This designation is always preceded by an M signifying that munitions have been used on-range.

Receptor

- **Human (H)**: Source-receptor interaction is complete or potentially complete for human receptors. This designation is always preceded by both the M designation and the applicable pathway designation.
- **Ecological (E)**: Source-receptor interaction is complete or potentially complete for ecological receptors. This designation is always preceded by both the M designation and the applicable pathway designation.

The (H) and (E) designations follow the applicable pathway. For example, if a source has been identified, both surface water and groundwater pathways exist, the source-receptor interaction is complete for human and ecological receptors of surface water, and the source-receptor interaction is complete for human receptors of groundwater, then the group is MSW (H/E) GW (H).

4.2 Categorization Rationale

Each range group can be placed into one of three categories (Referred, Inconclusive, or Unlikely). Category definitions are presented in Section 1.2 and **Appendix A**.

Ranges in groups with at least one CSM component absent (source of MCOC, migration pathway, or receptor) are designated as Unlikely because a source-receptor interaction does not exist.

Ranges in groups with all three CSM components (source of MCOC, migration pathway, and receptor) are categorized based on review of available data using a weight of evidence approach. Examples for placing these range groups into the three categories are provided below.

- **Referred –** If one or more MCOC are present in off-range media (i.e., groundwater, sediment, surface water, or soil) at levels that present an unacceptable risk to human health or the environment as confirmed through acceptable sampling data, the group is categorized as Referred.
- **Inconclusive** – If one or more MCOC are or have the potential to be present in off-range media and source-receptor interactions are complete or potentially complete, but data are unavailable or insufficient to determine whether receptors are at risk or whether potential source-receptor interactions are complete, the group is categorized as Inconclusive.
- **Unlikely** – Ranges where, based upon a review of readily available information, there is sufficient evidence to show that there are no known releases or source-receptor interactions that could present an unacceptable risk to human health or the environment are categorized as Unlikely. In addition, if compelling data (sampling or weight of evidence rationale) indicate that source-receptor interactions are complete, but the levels do not pose unacceptable risk to human health or the environment, the group is categorized as Unlikely.

5.0 Conceptual Site Model Narrative

The operational ranges at Fort Jackson assessed in this Phase I Assessment have been placed into three groups: MSW (H/E) GW (H/E), MSW (H/E) GW, and LS. Rationale for placing ranges into these groups is discussed in the sections below and is based on the source of potential MCOC, exposure pathways, and potential receptors described earlier in this report. This information is used to determine if a potential source-receptor interaction exists for each relevant pathway identified, which is used to determine the appropriate categorization for each group.

Figure 5-1 depicts the range groupings, which are described below. The potential source-receptor interactions based on the CSM components described below are depicted in **Figure 5-2** for Group MSW (H/E) GW (H/E), **Figure 5-3** for Group MSW (H/E) GW, and **Figure 5-4** for Group LS. **Table 5-1** provides site-specific information concerning the CSM components for each group identified within Fort Jackson, including potential sources, source media, release mechanisms, exposure media, exposure routes, and receptors.

5.1 Group MSW (H/E) GW (H/E)

Group MSW (H/E) GW (H/E) includes 36 operational ranges totaling 12,425 acres.

5.1.1 Primary Source and MCOC

Sources of potential MCOC at Group MSW (H/E) GW (H/E) ranges include one large dudded impact area, one mostly non-dudded impact area, eight firing ranges, 17 small arms ranges, and 11 training areas. Training areas have been included in Group MSW (H/E) GW (H/E) if their historical or current use presents a potential MCOC source. Three training areas in Group MSW (H/E) GW (H/E) have received heavy munitions usage in the past, five contain known or suspected dudded areas, and one of the training areas contains two mortar firing points, which present a potential source but have not been used in the last four years according to RFMSS data. The remaining two training areas are entirely overlapped by four of the firing ranges included in this group; therefore, their acreage has not been included in the total acreage of Group MSW (H/E) GW (H/E). Military munitions currently used on Group MSW (H/E) GW (H/E) operational ranges include small to large caliber military munitions, rockets, grenades, and pyrotechnics. It is expected that the dudded impact area contains the greatest concentrations of MCOC since it has been actively used as an impact area since the 1940s and continues to receive heavy usage. MCOC associated with the ranges placed into the MSW (H/E) GW (H/E) group include metals MCOC (lead, antimony, copper, zinc, and tungsten), nitroglycerin, TNT, RDX, HMX, 2,4-DNT, 2,6-DNT, PETN, and perchlorate. WP has not been included as an associated MCOC based on the sampling results discussed in Section 3.1.3, which indicate that the risk of WP contamination at Fort Jackson is negligible (USACE, 1993).

5.1.2 Source Media

Primary source media identified at the ranges in Group MSW (H/E) GW (H/E) include soil, surface water, and sediment. MCOC can deposit in surface water and sediment from munitions landing directly in water. High order detonations, which constitute most munitions detonations, generate undetectable to barely detectable and diffuse surface residuals. Because there is no direct contact of MCOC with groundwater, shallow groundwater is considered a secondary source where potential MCOC can leach/infiltrate into shallow groundwater from soil, sediment, and surface water. Surface water and sediment can also be secondary sources if they receive surface water runoff or erosion from soil source areas or surficial groundwater discharge.

5.1.3 Pathway Analysis

Migration mechanisms for potential MCOC in soil at the ranges in Group MSW (H/E) GW (H/E) include leaching or infiltrating through the soil profile to groundwater and surface erosion and subsequent runoff to sediment and surface water. MCOC in surface water are also subject to plant and animal uptake and subsequent ingestion and/or dermal absorption by humans or off-range ecological receptors. At Fort Jackson, a shallow perched groundwater aquifer produces a high likelihood for surficial groundwater to discharge into down gradient surface water. As a result, MCOC have the potential to migrate from shallow groundwater to surface water. This groundwater pathway exists only for the surficial aquifer and not for the deep regional aquifer, the Middendorf Formation. Sampling data indicate that groundwater wells at Fort Jackson screened in the regional aquifer do not contain elevated levels of MCOC. Therefore, it is not likely that there is a potentially complete pathway for MCOC to the deeper regional aquifer. It is assumed that this is due primarily to the clay layers between the two aquifers, which significantly decrease permeability.

5.1.4 Potential Source-Human Interaction Pathway Analysis

Ranges within Group MSW (H/E) GW (H/E) lie within the Gills Creek, Mill Creek, and Cedar Creek watersheds, which are delineated on **Figure 3-8**. Surface water source-human interaction pathways have been identified for all three watersheds. Potential MCOC sources within the Mill Creek watershed may impact the Twin Lakes recreational area located in the Fort Jackson cantonment area. Potential MCOC sources from the Gill Creek ranges could potentially impact off-installation recreational areas at Forest Lake and Lake Katherine. Surface water and sediment in these recreational areas are potential pathways for human receptors via dermal contact or accidental ingestion. The Weston Lake Recreation Area just downstream of the Cedar Creek watershed ranges is used for fishing, camping, and other recreational activities. Surface water and sediment in the Weston Lake Recreation Area present potential pathways for human receptors via dermal contact or accidental ingestion. **Figure 3-9** displays regional watersheds and down gradient surface water bodies within approximately 15 miles of Fort Jackson. In addition, fish are known to bioaccumulate certain MCOC, including metals. No fish tissue studies were identified for areas in or around Fort Jackson; however, such bioaccumulation from exposure either on-range or off-range is possible. Therefore, consumption of fish is a potential pathway to humans.

Surficial groundwater flow within these watersheds generally follows the direction of surface water flow. The MCOC source areas in the Cedar Creek watershed are up gradient of rural areas that most likely use private groundwater wells as their primary drinking water source. These areas are not serviced by public water supply lines, as shown in **Figure 3-6**. **Figure 3-6** also depicts a four-mile radius of Fort Jackson, where potential groundwater receptors are most likely located. As shown in **Figure 5-1**, much of the area to the south and southeast of Group MSW (H/E) GW (H/E) ranges lies within McCrady Training Center, which is comprised primarily of DoD-owned operational range area. There is a cantonment area in the southeast corner of the McCrady Training Center. Potable water for this cantonment area is supplied by drinking water wells that are screened in the Middendorf Formation and, therefore, are unlikely to contain MCOC based on sampling of wells screened in the regional aquifer. Private groundwater wells located along the southeast portion of Leesburg Road that are screened in the surficial aquifer represent a potential pathway for human receptors via ingestion or dermal contact.

The MCOC source areas in the Gills Creek and Mill Creek watersheds are up gradient of urban areas that receive potable water service from the city of Columbia, as shown by the location of public water supply lines in **Figure 3-6**; however, the SCDNR database has also identified groundwater wells in

these areas. Therefore, source-human interaction groundwater pathways have been identified for MCOC source areas in the Gills Creek and Mill Creek watersheds**.**

5.1.5 Potential Source-Ecological Interaction Pathway Analysis

The migration of potential MCOC off-range from the sources identified at the ranges in Group MSW (H/E) GW (H/E) through surface water and groundwater pathways has the potential to affect sensitive environments (e.g., wetland habitats). **Figure 3-8** shows the locations of red-cockaded woodpecker cavity trees throughout Fort Jackson and the McCrady Training Center. These trees are present in the other than operational land around Twin Lakes, Boyden Arbor Pond, Weston Lake, and additional habitat may exist in the rural land south and southeast of the installation. The migration of MCOC off-range through surface water pathways has the potential to affect these sensitive off-range habitats as well as wetlands throughout the installation. Surficial groundwater potentially containing MCOC may also migrate off-range and discharge to surface water downstream.

5.2 Group MSW (H/E) GW

Group MSW (H/E) GW includes 15 operational ranges totaling 4,046 acres.

5.2.1 Primary Source and MCOC

Group MSW (H/E) GW consists of two firing ranges, two small arms ranges, and 11 training areas. Training areas have been included in Group MSW (H/E) GW if their historical or current use presents a potential MCOC source. Two training areas in Group MSW (H/E) GW have received heavy munitions usage in the past, two contain known or suspected dudded areas, and two contain artillery firing points. An additional five training areas contain both artillery firing points and known or suspected dudded areas. Sources of potential MCOC at Group MSW (H/E) GW ranges consist of areas that are known or suspected to be dudded due to historical munitions use, fixed firing points, and small arms ranges. Military munitions currently used on Group MSW (H/E) GW operational ranges include small, medium, and large caliber military munitions and pyrotechnics. MCOC associated with the ranges placed into the MSW (H/E) GW group include metals MCOC (lead, antimony, copper, zinc, and tungsten), nitroglycerin, TNT, RDX, HMX, 2,4-DNT, 2,6-DNT, PETN, and perchlorate. WP has not been included as an associated MCOC based on the sampling results discussed in Section 3.1.3, which indicate the risk of WP contamination at Fort Jackson is negligible (USACE, 1993).

5.2.2 Source Media

The primary source media identified at the ranges in Group MSW (H/E) GW include soil, surface water, and sediment. MCOC may deposit in surface water and sediment from munitions landing directly in water. High order detonations, which constitute most munitions detonations, generate undetectable to barely detectable and diffuse surface residuals. Because there is no direct contact of MCOC with groundwater, shallow groundwater is considered a secondary source where potential MCOC can leach/infiltrate into shallow groundwater from soil. Surface water and sediment can also be secondary sources if they receive surface water runoff or erosion from soil source areas or surficial groundwater discharge.

5.2.3 Pathway Analysis

Migration mechanisms for potential MCOC in soil at the ranges in Group MSW (H/E) GW include leaching or infiltrating through the soil profile to groundwater and surface erosion and subsequent runoff to sediment and surface water. At Fort Jackson, a shallow perched groundwater aquifer

produces a high likelihood for shallow groundwater to discharge into down gradient surface water. As a result, MCOC have the potential to migrate from shallow groundwater to surface water. This groundwater pathway exists only for the surficial aquifer and not for the deep regional aquifer, the Middendorf Formation. Sampling data indicate that groundwater wells at Fort Jackson screened in the regional aquifer do not contain elevated levels of MCOC. Therefore, it is not likely that there is a potentially complete pathway for MCOC to the deeper regional aquifer. It is assumed that this is due primarily to the clay layers between the two aquifers, which significantly decrease permeability.

5.2.4 Potential Source-Human Interaction Pathway Analysis

All of the ranges within Group MSW (H/E) GW lie within the Colonels Creek watershed. Potential MCOC sources within Colonels Creek watershed may impact Murray Pond, which is located southeast of the installation and utilized for recreational activities. Surface water and sediment in this recreational area is a potential pathway for human receptors via dermal contact or accidental ingestion. **Figure 3-9** displays regional watersheds and down gradient receptor surface water bodies within approximately 15 miles of Fort Jackson. No fish tissue studies were identified for areas in or around Fort Jackson; however, such bioaccumulation from exposure either on-range or off-range is possible. Therefore, consumption of fish is a potential pathway to humans.

Surficial groundwater flow within the Colonels Creek watershed generally follows in the direction of surface water flow. The MCOC source areas in the Colonels Creek watershed are located more than four miles away from residences on Leesburg Road that may use domestic wells and, therefore, are not considered to impact these groundwater receptors.

5.2.5 Potential Source-Ecological Interaction Pathway Analysis

The migration of potential MCOC off-range from the sources identified at the ranges in Group MSW (H/E) GW through down gradient surface water bodies has the potential to affect sensitive environments (e.g., wetland habitats). **Figure 3-8** shows the locations of red-cockaded woodpecker cavity trees throughout Fort Jackson and the McCrady Training Center. Additional habitat may exist in the rural land south and southeast of the installation. The migration of MCOC off-range through surface water pathways has the potential to affect these sensitive off-range habitats as well as wetlands throughout the installation. No fish tissue studies were identified for areas in or around Fort Jackson; however, such bioaccumulation from exposure either on-range or off-range is possible. Therefore, consumption of fish is a potential pathway to humans.

5.3 Group LS

Group LS includes 53 operational ranges totaling 13,004 acres, all of which are training areas.

5.3.1 Primary Source and MCOC

Group LS consists of 28 training areas where historical munitions usage has occurred, which mostly consisted of safety fans for small arms ranges, and 25 training areas that include training and maneuver areas, non-live-fire courses, and obstacle courses. Small caliber blanks are used on these ranges, and there is limited use of pyrotechnics. Small caliber military munitions are also used on one of the Group LS ranges. From 2002 to 2006, approximately 2,500 small caliber rounds were used throughout this 358-acre range. The relatively small amount of MCOC associated with this amount of small caliber rounds, dispersed over several hundred acres, is not considered a potential source. No or limited potential MCOC sources were identified for these 53 ranges.

5.3.2 Source Media

No or limited potential MCOC sources were identified for the operational ranges in Group LS; therefore, source media were not identified.

5.3.3 Pathway Analysis

No or limited potential MCOC sources were identified for the operational ranges in Group LS; therefore, potential pathways were not evaluated.

5.3.4 Potential Source-Human Interaction Pathway Analysis

No or limited potential MCOC sources were identified for the operational ranges in Group LS; therefore, potential source-human receptor interactions were not evaluated.

5.3.5 Potential Source-Ecological Interaction Pathway Analysis

No or limited potential MCOC sources were identified for the operational ranges in Group LS; therefore, potential source-ecological receptor interactions were not evaluated.

5.4 Data Uncertainty

ARID-GEO (2006)

Based on the ORIS data obtained and the interviews conducted during the site visit, the following data uncertainties regarding the ARID-GEO March 2006 data were identified:

- ARID-GEO March 2006 is missing one of the non-live-fire courses present at Fort Jackson, based on interviews with range personnel.

- According to Fort Jackson Range Control, three training areas previously licensed to SCARNG for training have been taken back for Fort Jackson Basic Training mission use, and should be included in the Fort Jackson ORIS. Conversely, one of the firing ranges listed in the Fort Jackson ORIS is licensed for SCARNG use, and should be assessed under the McCrady Training Center ORAP Phase I Assessment.

- According to Fort Jackson's field training map, there are four firing ranges located within two of the training areas at the perimeter of the large dudded impact area (Fort Jackson ITAM, 2006). These training areas are shaded entirely as "Other" ranges on mapping for the March 2006 draft update of ARID-GEO. The overlapping firing ranges are labeled but there is no distinction in use.

- ARID-GEO March 2006 data also shows the western impact area, which is partially dudded, as an entirely non-dudded area, as shown in **Figure 1-2**. During the course of data review for this QAR, it was determined that a 273-acre portion of the West Small Arms Impact Area is known or suspected to be a dudded impact area.

RFMSS

Some RFMSS data for the installation are incorrect, including, for example, the use of small caliber military munitions at known non-live-fire courses. These data conflict with information obtained during the site visit and range tour and from installation documents. Malcolm Pirnie contacted DPTMS personnel, who confirmed that no live ammunition is used on the aforementioned non-live-fire courses and no live grenades are used on one of the small arms ranges. DPTMS also confirmed that no munitions are used at several ranges listed in the RFMSS. Additional facilities were listed in

the RFMSS that are not ranges, and DPTMS personnel confirmed that these entries are errors.

Impact of Data Uncertainties

The data uncertainties presented above are included to point out inconsistencies or deficiencies with ARID and RFMSS data. Additional resources (e.g., personnel interviews, documents, previous versions of ARID) have served to close the data gaps opened by these data uncertainties. These data uncertainties are expected to have no significant impact on the conclusions of the report.

Table 5-1: Summary of the Conceptual Site Model Components

Group Identification	Primary Source	Primary MCOC	Source Media	Release Mechanism	Exposure Media	Exposure Routes	Receptors
Group MSW (H/E) GW (H/E)	Firing points, small arms firing, known or suspected dudded areas, impact area, and historical artillery impact areas / heavy usage	TNT, RDX, HMX, 2,4,-DNT, 2,6-DNT, PETN, perchlorate, nitroglycerin, lead, antimony, copper, zinc, and tungsten	Soil, surface water, and sediment	Leaching, infiltration, erosion/runoff, plant and animal uptake, and discharge of groundwater to down gradient surface water	Surface water / sediment, food chain, and groundwater	Ingestion and dermal absorption	Off-range workers and residents, recreational users of surrounding lakes, and off-range threatened and endangered animals
Group MSW (H/E) GW	Firing points, small arms firing, known or suspected dudded areas, dudded impact area, demolition area, and heavy historical munitions usage	TNT, RDX, HMX, 2,4,-DNT, 2,6-DNT, PETN, perchlorate, nitroglycerin, lead, antimony, copper, zinc, and tungsten	Soil, surface water, and sediment	Leaching, infiltration, erosion/runoff, plant and animal uptake, and discharge of groundwater to down gradient surface water	Surface water / sediment, food chain, and groundwater	Ingestion and dermal absorption	Recreational users of surrounding lakes and off-range threatened and endangered animals
Group LS	None or limited	Not evaluated

6.0 Summary of Findings and Conclusions

The operational ranges at Fort Jackson have been categorized as a result of the Phase I Assessment as described below. **Figure 6-1** illustrates the source-receptor interactions identified during the Phase I Assessment. The findings and conclusions for these operational ranges are presented in **Table 6-1.** Conclusions are based on readily available information collected to date.

6.1 Summary of Findings

The 104 ranges at Fort Jackson operated by the U.S. Army Training Center consist of small arms ranges, live-fire ranges, training/maneuver areas, dudded impact areas, and a non-dudded impact area totaling approximately 29,475 acres. According to munitions data collected during the Phase I Assessment, the types of munitions fired include small, medium, and large caliber munitions. Potential MCOC associated with these munitions types include metals (including tungsten), high explosives (e.g., RDX, TNT, HMX), nitroglycerin, and perchlorate.

Based on data collected during the Phase I Assessment regarding current and historical MCOC sources, potential migration pathways from ranges, and potential off-range human and/or ecological receptors, the operational ranges at Fort Jackson operated by the U.S. Army Training Center have been placed into the following range groupings:

Group MSW (H/E) GW (H/E)
The 36 ranges identified in Group MSW (H/E) GW (H/E), covering 12,425 acres of Fort Jackson, have current and historical sources of potential MCOC that were identified during the Phase I Assessment. Sources of potential MCOC at Group MSW (H/E) GW (H/E) ranges include a dudded impact area (5,430 acres), mostly non-dudded impact area, firing ranges, areas that are known or suspected to be dudded due to historical munitions use, and areas historically used for medium and large caliber firing. It is expected that the dudded impact area contains the greatest concentrations of MCOC since it has been actively used as an impact area since the 1940s and continues to receive heavy usage. MCOC from these ranges have the potential to migrate off-range via surface water and/or groundwater pathways to contact either human or ecological receptors.

Group MSW (H/E) GW
The 15 ranges identified in Group MSW (H/E) GW, covering 4,046 acres of Fort Jackson, have current and historical sources of potential MCOC that were identified during the Phase I Assessment. Sources of potential MCOC at Group MSW (H/E) GW ranges consist of areas that are known or suspected to be dudded due to historical munitions use, fixed firing points, and small arms ranges. These sources have potential migration pathways via surface water / sediment and plant and animal uptake that could facilitate potential MCOC migration off-range to contact either human or ecological receptors.

Group LS
The 53 ranges identified in Group LS, covering 13,004 acres of Fort Jackson, were found to have only limited or no known sources of MCOC from current or historical activities.

6.2 Conclusions

Each of the operational range groups described above is placed into one of three possible categories: Referred, Inconclusive, or Unlikely. Conclusions for each category are discussed below.

Referred – Refer to Appropriate Cleanup Program

Based on data reviewed during the Phase I Assessment, no operational ranges at Fort Jackson are categorized as Referred.

Inconclusive – Phase II Quantitative Assessment Required

Operational ranges where a source of potential MCOC source, an exposure pathway, and receptors have been identified are categorized as Inconclusive and comprise Groups MSW (H/E) GW (H/E) and MSW (H/E) GW. Based on current and historical military munitions usage at Fort Jackson and a review of potential migration pathways and potential human and/or ecological receptors, a total of 51 ranges were identified as having the potential for MCOC to migrate off-range and affect human and/or ecological receptors. At the completion of the Phase I Assessment process, installations with ranges in the Inconclusive category will be prioritized for further analysis during Phase II Quantitative Assessments.

Unlikely – Five-Year Review

Ranges determined to have at least one CSM component (i.e., source of potential MCOC, pathway, or receptor) absent or sampling data indicating that a source-receptor interaction is not present are categorized as Unlikely and comprise Group LS. Based on current and historical military munitions usage at Fort Jackson and a review of potential migration pathways and potential human and/or ecological receptors, a total of 53 ranges were identified as being unlikely to have potential MCOC migrate off-range and affect human or ecological receptors. Ranges categorized as Unlikely will be required to undergo a periodic re-evaluation to determine if conditions affecting this assessment (e.g., range operations, site conditions, applicable regulations) have changed since the original categorization was finalized (DoD, 2005). This re-evaluation will occur at least every five years.

Figure 6-1 presents the Phase I Assessment findings and conclusions for the ranges at Fort Jackson that are operated by the U.S. Army Training Center.

Table 6-1: Summary of Findings and Conclusions for Fort Jackson

Category	Group	Total Number of Ranges and Acreage	Source(s)	Pathway(s)	Human Receptors	Ecological Receptors	Conclusions and Rationale
Inconclusive	Munitions used; surface water and groundwater pathways present; human and ecological receptors identified	36 operational ranges; 12,425 acres	Firing points, small arms firing, impact areas, and historical artillery impact areas or heavy historical usage	Twin Lakes (west of operational range area in cantonment area), Mill Creek, Sun View Lake, and Lake Rebecca (southwest of Fort Jackson in Mill Creek watershed); Gills Creek and Forest Lake (west and southwest of Fort Jackson in Gills Creek watershed); Weston Lake and Cedar Creek (non-operational area southwest of the eastern impact area in Cedar Creek watershed); ; and the surficial groundwater aquifer to the south and west of Fort Jackson	Residents down gradient (south and west of Fort Jackson) and recreational users of Weston Lake, Twin Lakes, Sun View Lake, Lake Rebecca, and Forest Lake	Wetlands and threatened and endangered species downstream	Phase II Quantitative Assessment is required. Residents and recreational users are present down gradient and downstream.
	Munitions used; surface water pathways present; human and ecological receptors identified	15 operational ranges; 4,046 acres	Firing points, small arms firing, known or suspected dudded areas, demolition area, and heavy historical usage areas	Colonels Creek and Murray Pond (southeast of McCrady Training Center)	Recreational users of Murray Pond	Wetlands and threatened and endangered species downstream	Phase II Quantitative Assessment is required. Recreational users are present downstream.
Unlikely	Limited source	53 operational ranges; 13,004 acres	No source – limited or no military munitions use	Not evaluated (no source was identified)			Re-evaluate during the five-year review. Limited sources were identified.

Appendix A: Glossary of Terms

GLOSSARY OF TERMS

The terms outlined below are those that will be used commonly during the Phase I Assessment process. The relevant reference for each is presented at the end of the definition. If no reference is presented, then the term is not an official Department of Defense (DoD) definition and applies only to the U.S. Army's Operational Range Assessment Program.

Dudded Impact Area – An area having designated boundaries within which all dud-producing ordnance will detonate or impact. Vehicle bodies are sometimes placed in the area to act as targets for direct and indirect artillery fire. The primary function of the impact area is to contain weapons effects as much as possible using earthen berms or natural terrain features. Impact areas containing unexploded ordnance may not be used for maneuver. Each area, typically managed and scheduled by either numeric, lettered, or alphanumeric code through the installation training or range control manager (e.g., Directorate of Plans, Training, Mobilization and Security (DPTMS), DPTMS-equivalent), should be accounted for with a separate facility number and real property record.[1]

Group – A group is a collection of one or more ranges within an operational range area (range complex area) that shares similar characteristics. Similar characteristics can include types of activities, munitions usage, geographic proximity, surface water or groundwater divides, or even common receptors.[2]

Inconclusive – Phase II Quantitative Assessment Required – Ranges where existing information either is insufficient to make a source-receptor interaction determination or indicates the potential for such interaction to be occurring.[3]

Large Caliber – Munitions include projectiles greater than 60 millimeters (mm) (including 75-mm, 76-mm, 81-mm, 90-mm, 105-mm, 155-mm, 14-inch and 16-inch projectiles).[4]

Medium Caliber – Munitions include projectiles sized from 20-mm to 60-mm (including 20-mm, 25-mm, 30-mm, 37-mm, 40-mm and 60-mm projectiles).[5]

Military Munitions – All ammunition products and components produced or used by the armed forces for national defense and security, including ammunition products or components under the control of the DoD, the United States (U.S.) Coast Guard, the U.S. Department of Energy (DOE), and the Army National Guard. The term military munitions includes: confined gaseous, liquid, and solid propellants; explosives; pyrotechnics; chemical and riot control agents; smoke and incendiaries, including bulk explosives and chemical warfare agents; chemical munitions; rockets; guided and ballistic missiles; bombs; warheads; mortar rounds; artillery ammunition; small arms ammunition; grenades; mines; torpedoes; depth charges; cluster munitions and dispensers; demolition charges; and devices and components thereof. Military munitions do not include wholly inert items; improvised explosive devices; and nuclear weapons, nuclear devices, and nuclear components, other than nonnuclear components of nuclear devices that are managed under the nuclear weapons program of

[2] This definition was based on guidance from the USACHPPM (2005), as well as further input/guidance from the U.S. Army Environmental Command and the U.S. Army Center for Health Promotion and Preventive Medicine.
[3] See note 2.
[4] See note 2.
[5] See note 2.

the DOE after all required sanitization operations under the Atomic Energy Act of 1954 (42 United States Code [U.S.C.] 2011 et seq.) have been completed. (10 U.S.C. 101(e)(4)(A) through (C))

Munitions Constituents (MC) – Any materials that originate from unexploded ordnance, discarded military munitions, or other military munitions, including explosive and nonexplosive materials, and emission, degradation, or breakdown elements of such ordnance or munitions. (10 U.S.C. 2710(e)(3))

Munitions Constituents of Concern (MCOC) – Those MC that have the potential to migrate from a source area to a receptor (human or ecological) in sufficient quantity to cause an unacceptable risk to human health or the environment. (DoD Instruction [DODI] 4715.14, 30 November 2005) MCOC for high explosives include: trinitrotoluene (TNT); cyclotetramethylenetetranitramine (HMX); pentaerythritoltetranitrate (PETN); cyclotrimethylenetrinitramine (RDX); 2,4-dinitrotoluene (DNT); and 2,6-DNT. MCOC for small arms include lead, antimony, copper, zinc, and tungsten. MCOC for training areas include perchlorate (a propellant) and white phosphorus (an incendiary agent). Additional MCOC may be addressed on an installation-specific basis.[6]

Non-Dudded Impact Area – An area having designated boundaries within which ordnance that does not produce duds will impact. This area is composed mostly of the safety fans for small arms ranges. The primary function of the impact area is to contain weapons effects as much as possible using earthen berms or natural terrain features. Each area, typically managed and scheduled by either numeric, lettered, or alphanumeric code through the installation training or range control manager (e.g., DPTMS, DPTMS-equivalent), should be accounted for with a separate facility number and real property record. These impact areas may be used for maneuver, at the cost of curtailing the use of weapons ranges.[7]

Off-Range Area – For the purpose of the Phase I Assessment, off-range areas include those areas outside of the boundaries of the operational range area as established by the Army Range Inventory Database-Geodatabase. Off-range areas may include both on- (e.g., cantonment areas) and off-installation locations.

Operational Range – A range that is under the jurisdiction, custody, or control of the Secretary of Defense and that is used for range activities or, although not currently being used for range activities, that is still considered by the Secretary to be a range and has not been put to a new use that is incompatible with range activities. (10 U.S.C. 101(e)(3))

Other Munitions – Munitions from aerial fire (rockets and large bombs), hand grenades, light anti-tank weapons, and anti-armor missiles.[8]

Pathway – The environmental medium through which an MCOC is transported from the source to the receptor. (DoD, 2005)

[6] See note 2.
[7] See note 1.
[8] See note 2.

Range – The term range, when used in the geographical sense, means a designated land or water area that is set aside, managed and used for range activities of the DoD. The term includes: (A) firing lines and positions, maneuver areas, firing lanes, test pads, detonation pads, impact areas, electronic scoring sites, buffer zones with restricted access, and exclusionary areas and (B) airspace areas designated for military use in accordance with regulations and procedures proscribed by the Administrator of the Federal Aviation Administration. (10 U.S.C. 101(e)(1)(A) and (B))

Range Complex – For the purpose of the Phase I Assessment, range complexes are contiguous operational ranges that may be grouped together and assessed as a single range (also referred to as an operational range area).

Receptor – A human, animal, or plant species that is exposed, or that may be exposed, to MC. (DoD, 2005)

Referred – Ranges with compelling evidence (e.g., sampling data) to indicate the presence of an off-range release that potentially poses an unacceptable risk to human health or the environment.[9]

Sensitive Environments – Terrestrial or aquatic resources, fragile natural settings, or other areas with unique or highly valued environmental features.[10]

Small Arms – Small arms include all shotgun, .22-, .223-, .30-, .32-, .38-, .45-, and .50-caliber, 5.56-mm, 7.62-mm, 9-mm and 10-mm weapons.[11]

Small Caliber – Munitions used in small arms and fired from weapons with muzzle diameter of up to .50-caliber or one-half inch.[12]

Source – An area where MC may have been deposited, disposed, or placed. (DoD, 2005)

Training Area – For the purpose of the Phase I Assessment, training areas refer to the ranges that have non-live-fire troop activities. These areas can have a variety of activities that include bivouac, troop movement, and tactics.

Unknown Munitions – Items that have not been identified or positively identified.[13]

Unlikely – Five-Year Review – Ranges where, based upon a review of readily available information, there is sufficient evidence to show that there are no known releases or source-receptor interactions that could present an unacceptable risk to human health or the environment.[14]

B5 – Personnel Interviews

Fort Jackson Chief of Environmental Health, Preventive Medicine & Environmental Health
Date of interview: 12 October 2006 by Malcolm Pirnie, Inc.
Provided drinking water quality studies; these are listed in Appendix B4.

Fort Jackson DPTMS GIS Analyst
Date of interview: 12 October 2006 by Malcolm Pirnie, Inc.
No documents obtained.

Fort Jackson DPTMS Range Officer
Date of interview: 10 October 2006 by Malcolm Pirnie, Inc.
Provided the Fort Jackson Range Master Plan listed in Appendix B4.

Fort Jackson DPTMS Scheduler
Date of interview: 12 October 2006 by Malcolm Pirnie, Inc.
Provided RFMSS data for 1 January 2002 through 12 October 2006.

Fort Jackson DPTMS Training Facility Coordinator
Date of interview: 12 October 2006 and 27 November 2006 by Malcolm Pirnie, Inc.
Provided RFMSS data for 1 January 2002 through 12 October 2006.

Fort Jackson ENRD Division Chief
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
No documents obtained.

Fort Jackson ENRD, Environmental Management Branch Chief, Directorate of Logistics and Engineering
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
No documents obtained.

Fort Jackson ENRD Environmental Engineer
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
Provided documents related to landfill ammunition data; these are listed in Appendix B4.

Fort Jackson ENRD Environmental Specialist
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
Provided general environmental documents; these are listed in Appendix B4.

Fort Jackson ENRD Environmental Specialist (Cultural Resources)
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
Provided documents related to the cultural resources of Fort Jackson; these are listed in Appendix B4.

Fort Jackson ENRD Environmental Specialist (Drinking Water)
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
Provided documents related to drinking water studies and well locations; these are listed in Appendix B4.

Fort Jackson ENRD Environmental Specialist (National Environmental Policy Act)
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.

Provided Environmental Data Resources reports and general environmental documents; these are listed in Appendix B4.

Fort Jackson ENRD Forestry Chief
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
Provided the database containing forestry data listed in Appendix B4.

Fort Jackson ENRD GIS Specialist
Date of interview: 11 October 2006 and 4 December 2006 by Malcolm Pirnie, Inc.
Provided GIS layers; these are listed in Appendix B4.

Fort Jackson ENRD Installation Restoration Program (IRP) Manager
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
Provided IRP reports and general environmental documents; these are listed in Appendix B4.

Fort Jackson ENRD Soil Conservationist and Storm Water Manager
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
Provided documents relating to storm water sampling at the small arms ranges, Gills Creek, and Mill Creek; these are listed in Appendix B4.

Fort Jackson ENRD Wildlife Biologist
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
Provided biological assessments and documents related to threatened and endangered species; these are listed in Appendix B4.

Fort Jackson ENRD Wildlife Branch Chief
Date of interview: 12 November 2006 by Malcolm Pirnie, Inc.
Provided biological assessments; these are listed in Appendix B4.

Fort Jackson ITAM Coordinator
Date of interview: 12 October 2006 by Malcolm Pirnie, Inc.
Provided documents related to range sustainment and modification; these are listed in Appendix B4.

McCrady Training Center Environmental/Conservation Manager
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
No documents obtained.

McCrady Training Center Maintenance (Drinking Water)
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
Provided no documents relevant to Fort Jackson.

Mississippi State Professor
Date of interview: 25 January 2007 by Malcolm Pirnie, Inc.
Provided information on small arms ranges study, specifically the lead detection limit used.

U.S. Army Training Center Ammunition Manager
Date of interview: 12 October 2006 and 30 November 2006 by Malcolm Pirnie, Inc.
Provided documents containing data on basic training ammunition packages and use; these are listed in Appendix B4.

Re: **Draft Final Operational Range Assessment Program Phase I Qualitative Assessment Report**
McCrady Training Center, South Carolina

Dear LTC Dykes:

1. Enclosed (3 hard copies and 2 electronic copies) is the Draft Final Operational Range Assessment Program Phase I Qualitative Assessment Report for McCrady Training Center, South Carolina. In addition to the Report, the electronic copies also include a copy of the Read-Ahead Package, Site Visit Trip Report, and the Response to Comments documents for the Draft version of the Report.

2. The Army Environmental Division of the Army Headquarters has recently directed that Phase I Qualitative Assessment Reports with at least one range characterized as "Inconclusive" will remain in the "Draft Final" status. The reason for remaining in the "Draft Final" status is that "Inconclusive" ranges require further assessment (Phase II) and therefore the assessment process is not complete. Phase II assessments will begin in 2010. The Phase I report will be incorporated into the corresponding Phase II report as an appendix with the Phase I Conceptual Site Model forming the basis of Phase II sampling.

3. The Technical Outreach Guidance (TOG) for the Operational Range Assessment Program and a Department of Defense Memorandum were enclosed in the Read-Ahead Package distributed on 16 March 2007. These documents provide additional information on how to address questions regarding the Phase I Assessment Report. Any new guidance will be provided to you as it is developed.

4. If you have any questions regarding this matter please call John Buck, USAEC, at 410-436-4844 or me at 813-242-7208.

Regards,

MALCOLM PIRNIE, INC.

EXECUTIVE SUMMARY

The United States (U.S.) Army is conducting qualitative assessments at operational ranges to meet the requirements of Department of Defense policy and to support the U.S. Army Sustainable Range Program. The operational range qualitative assessment (hereinafter referred to as Phase I Assessment) is the first phase of the U.S. Army Operational Range Assessment Program (ORAP). This Phase I Assessment evaluates the operational range area at McCrady Training Center to assess whether further investigation is needed to determine if potential munitions constituents of concern (MCOC) are or could be migrating off-range at levels that may pose an unacceptable risk to human health or the environment. In conducting the Phase I Assessment, MCOC sources, potential off-range migration pathways, and potential off-range human and ecological receptors are evaluated as appropriate.

McCrady Training Center is located in Columbia, South Carolina, within Richland County. The Department of the Army owns the entire training center, including the cantonment area, and the South Carolina Army National Guard (SCARNG) has held a nonexclusive license for training operations since 1943. The licensed area comprises 15,267 acres within the boundaries of Fort Jackson. McCrady Training Center is the SCARNG's largest and most utilized training area, serving as the central point for state missions, while also supporting federal missions.

As part of the Operational Range Inventory Sustainment, an update to the Army Range Inventory Database-Geodatabase (ARID-GEO) was submitted to the U.S. Army Environmental Command in October 2006 (ARID-GEO [2006]). ARID-GEO (2006) identified 62 operational range areas encompassing a total of 14,895 acres. The total operational range area was derived from the Operational Use Area (total range area) acreage as reported in ARID-GEO (2006). A total of 416 acres were identified as other than operational acreage. McCrady Training Center serves as a training center for the Army National Guard and the Army Reservists stationed in South Carolina, North Carolina, Georgia, Florida, the Virgin Islands, and Puerto Rico. The operational areas support a variety of activities, including live-fire weapons training, heavy and light maneuver exercises, dudded and non-dudded impact areas, and artillery and mortar firing points.

MCOC sources identified at McCrady Training Center consist of small to large caliber firing ranges, mortar and artillery firing points, demolition areas, training and maneuver areas, suspected dudded areas, and areas that received a heavy historical munitions loading. In general, MCOC from primary source areas potentially impact the following source media: (1) soil (e.g., impact berms, impact areas surrounding targets, burn pits) and (2) surface water / sediment (e.g., direct deposition into streams and wetlands).

MCOC can be released to groundwater (down gradient), surface water / sediment (downstream), off-range soil, or the food chain via a variety of release mechanisms. Release mechanisms for soil may include leaching from soil to groundwater or erosion and runoff to off-range surface soil or to nearby streams. Once potential MCOC are deposited in surface water / sediment, they have the potential to migrate downstream or be taken up by aquatic plants or animals. Release mechanisms for surface water / sediment are natural stream flow and sediment transport. Drainage from the majority of McCrady Training Center is directed toward the Wateree River to the southeast. Two remote small arms ranges drain to the Congaree River to the southwest.

The main human receptors are users of water from off-installation wells and persons utilizing recreational areas downstream of McCrady Training Center. The main ecological receptors are

sensitive environments and threatened and endangered species located off-installation and in other than operational areas on the installation.

The 62 operational ranges at McCrady Training Center are categorized as Inconclusive or Unlikely.

Inconclusive – Phase II Quantitative Assessment Required

Forty-eight ranges at McCrady Training Center are categorized as Inconclusive, totaling 12,243 acres. These ranges consist of firing ranges, small arms ranges, and training areas. Ranges categorized as Inconclusive are those operational ranges where either existing information is insufficient to make a source-receptor interaction determination or the information indicates the potential for such interaction to be occurring. Ranges categorized as Inconclusive will undergo Phase II of the ORAP, consisting of a quantitative assessment with sampling and additional data collection.

Unlikely – Five-Year Review

Fourteen ranges at McCrady Training Center are categorized as Unlikely, totaling 2,652 acres. These ranges consist of training areas. Ranges where, based upon a review of readily available information, there is sufficient evidence to show that there are no known releases or source-receptor interactions off-range that could present an unacceptable risk to human health or the environment are categorized as Unlikely. Ranges categorized as Unlikely are required to be re-evaluated at least every five years. Re-evaluation may occur sooner if significant changes (e.g., change in range operations or site conditions, regulatory changes) occur that affect determinations made during this Phase I Assessment.

Table ES-1 summarizes the Phase I Assessment findings.

Table ES-1: Summary of Findings and Conclusions for McCrady Training Center

Category	Total Number of Ranges and Acreage	Source(s)	Pathway(s)	Human Receptors	Ecological Receptors	Conclusions and Rationale
Inconclusive	46 operational ranges; 12,199 acres	Firing points, small arms firing, demolition areas, suspected dudded areas, and historical artillery impact areas or firing points	Colonels Creek and Murray Pond (to the south and southeast); Weston Lake and Cedar Creek (to the southeast and southwest); surficial groundwater aquifer (to the south, southeast, and southwest)	Residents down gradient, local and off-range residents, and recreational users of Murray Pond and Weston Lake downstream	Wetlands and threatened and endangered species downstream	Phase II Quantitative Assessment is required. Residents and recreational users are present down gradient and downstream.
	2 operational ranges; 44 acres	Small arms firing	Gills Creek and Forest Lake (to the west and southwest)	Recreational users of Forest Lake and Lake Katherine downstream	Wetlands and threatened and endangered species downstream	Phase II Quantitative Assessment is required. Residents and recreational users are present downstream.
Unlikely	14 operational ranges; 2,652 acres	Limited source – limited or no historical military munitions use	Not evaluated (limited source was identified)			Re-evaluate during the five-year review. Limited source was identified.

1.0 Introduction

The United States (U.S.) Army is conducting qualitative assessments at operational ranges to meet the requirements of Department of Defense (DoD) policy and to support the U.S. Army Sustainable Range Program. The operational range qualitative assessment (hereinafter referred to as Phase I Assessment) is the first phase of the U.S. Army Operational Range Assessment Program (ORAP). The Phase I Assessment will review readily available data to evaluate, verify, validate, document, and report on operational ranges within the United States and its territories. Phase I Assessments are being conducted on Active Army, Army Reserve, and Army National Guard Bureau (NGB) installations (including both federally and state owned).

The conclusions in this report have been based, in part, on information obtained from third parties, which may include environmental assessment reports, environmental agency records, historical aerial photographs, and other public records obtained from various sources. Unless noted, Malcolm Pirnie has not independently evaluated or verified the accuracy or completeness of such third party information. Visual observations of the site only represent conditions at the time of the site visit. Malcolm Pirnie makes no warranties that the on-site observations made during the site visit are representative of historical or future conditions at the site.

1.1 Project Scope and Drivers

The Phase I Assessment process evaluates potential source-receptor interaction between off-range[1] receptors and the potential munitions constituents of concern (MCOC) migrating from all operational ranges within the Operational Range Inventory. The process for evaluating potential source-receptor interactions is outlined in the *Final Work Plan / Management Plan for the U.S. Army Operational Range Assessment Program Qualitative Operational Range Assessments* (Malcolm Pirnie, 2005).

The ORAP is being implemented to fulfill requirements identified implicitly or explicitly in:

- DoD Directive 4715.11 *Environmental and Explosives Safety Management on Operational Ranges Within the United States* (2004) and
- DoD Instruction (DODI) 4715.14 *Operational Range Assessments* (2005).

1.2 Purpose

The purpose of this Phase I Assessment is to evaluate the operational ranges at McCrady Training Center to assess whether further investigation is needed to determine if potential MCOC are or could be migrating off-range at levels that may pose an unacceptable risk to human health or the environment.

Based on the readily available data obtained during the Phase I Assessment process, all operational ranges at McCrady Training Center were placed into groups according to military munitions use and the presence or absence of potential MCOC, migration pathways, and receptors. Each operational

[1] Off-range areas include those areas outside of the boundaries of the operational range area, as established by the Army Range Inventory Database-Geodatabase (ARID-GEO). Off-range areas may include both on-installation (e.g., cantonment areas) and off-installation areas or locations.

range group was then placed into one of three possible categories – Referred, Inconclusive, or Unlikely:

- **Referred – Refer to Appropriate Cleanup Program**: ranges with compelling evidence (e.g., sampling data) to indicate the presence of an off-range release that potentially poses an unacceptable risk to human health or the environment
- **Inconclusive – Phase II Quantitative Assessment Required**: ranges where existing information either is insufficient to make a source-receptor interaction determination or indicates the potential for such interaction to be occurring
- **Unlikely – Five-Year Review**[2]: ranges where, based upon a review of readily available information, there is sufficient evidence to show that there are no known releases or source-receptor interactions that could present an unacceptable risk to human health or the environment

Appendix A provides a glossary of common terms referred to in the ORAP.

1.3 General Installation Information

McCrady Training Center is located in Columbia, South Carolina (SC), within Richland County. The Department of the Army owns the entire training center, including the cantonment area, and the South Carolina Army National Guard (SCARNG) has held a nonexclusive license for training operations since 1943. The licensed area comprises 15,267 acres within the boundaries of Fort Jackson. The main gate for McCrady Training Center is located on Leesburg Road (Highway 262), which forms the southern boundary of the training center, just west of the intersection with McCords Ferry Road (Highway 601), which forms the eastern boundary. The training center is bounded by Screaming Eagle Road (Highway 268) to the northeast, and Division Road, within Fort Jackson, to the northwest. **Figure 1-1** illustrates the general location of McCrady Training Center.

McCrady Training Center's history is intertwined with Fort Jackson's history. Fort Jackson originally was established in 1917 as an infantry training center (referred to as Camp Jackson). The installation was inactive from 1921 to 1925. In 1925, the War Department decided to use the post again as a training camp for the SCARNG. From 1925 to 1939, it was controlled by the state and used as an encampment and training area for SCARNG troops. During World War II (WWII), Fort Jackson became a permanent military installation used primarily for infantry training. Additional property was acquired on the eastern and northern sides of the installation until it included 52,562 acres. In 1943, the land for McCrady Training Center, formerly referred to as Leesburg Training Center, was licensed to the SCARNG by the Department of the Army.

McCrady Training Center is the largest of the SCARNG training centers and is the primary facility for the SCARNG, supporting federal missions and serving as a staging site for state missions. The 218th Regiment (Leadership) Total Army School, located at McCrady Training Center, serves as the schoolhouse for the southeastern region (USAEC and USDA, 2001). McCrady Training Center

[2] All operational ranges must be periodically re-evaluated to determine if there is a release or substantial threat of release of MCOC from an operational range to an off-range area. Range groups categorized as Unlikely are to be re-evaluated at least every five years. Re-evaluation may occur sooner if significant changes (e.g., changes in range operations or site conditions, regulatory changes) occur that affect determinations made during the Phase I Assessment.

provides training ground for a variety of military activities utilizing modern and sophisticated equipment, such as M1A1 tanks, Multiple Launch Rocket Systems, Bradley fighting vehicles, and Apache attack helicopters (USAEC and USDA, 2001).

The final Operational Range Inventory Sustainment update was submitted to the U.S. Army Environmental Command (USAEC) in October 2006 (ARID-GEO [2006]). The ARID-GEO (2006) identified 62 operational ranges licensed to the SCARNG, encompassing a total of 14,895 acres. The total operational range area was derived from the Operational Use Area (total range area) acreage as reported in ARID-GEO (2006). The operational areas support live-fire weapons training and heavy and light maneuver exercises. **Figure 1-2** illustrates the operational range areas identified in the ARID-GEO (2006).

2.0 Assumptions, Programmatic Exclusions, and Data Collection Efforts

2.1 Assumptions

Statements in this report were made using available supporting documents and data obtained during the centralized data collection efforts and site visits conducted at McCrady Training Center in October 2006 and May 2007. An informal briefing and range tour were conducted during the October 2006 site visit in conjunction with the range tour for the Fort Jackson Phase I Assessment. On 23 May 2007, the formal ORAP Phase I Assessment in-brief for McCrady Training Center was held at the SCARNG Joint Forces Headquarters in Columbia, followed by interviews with SCARNG personnel. The findings and conclusions of the supporting documents and data are assumed to be accurate and scientifically defensible. Conclusions and recommendations are based on the data gathered during the Phase I Assessment.

The Phase I Assessment assumes that the primary pathways for off-range migration are water related (i.e., surface water, sediment, and groundwater). This is to conform to the DODI 4715.14 emphasis on off-range migration (DoD, 2005). Other media may be considered, if warranted based on site-specific conditions.

2.2 Programmatic Considerations and Exclusions

For the purposes of the Phase I Assessment, an unacceptable risk to human health or the environment may occur if there is a source of MCOC, a pathway for MCOC to potentially move off-range, and an off-range receptor that may be impacted by the migrating MCOC. Where all three of these elements are present, further evaluation may be required. The paragraphs below present the potential pathways and receptors considered for the Phase I Assessments. Potential MCOC migration pathways that have been evaluated and programmatically excluded (except in unique situations that compel their inclusion) are also presented.

2.2.1 Exposure to Surface Water

The U.S. Environmental Protection Agency (USEPA) *Guidance for Performing Preliminary Assessments under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)* (1991) requires the identification of potential surface water receptors up to 15 miles downstream from the location at which potential MCOC may move beyond the aerial extents of the source area. Only those surface water receptors identified in the surface water pathway segments downstream of the operational range source area are being evaluated and assessed.

Dermal contact and incidental ingestion of MCOC by human receptors within the off-range surface water pathway, for areas other than designated recreational areas (or areas known or suspected of being used frequently for swimming), are programmatically excluded. While surface water may be a viable exposure pathway in some instances, it is not expected to be significant in most cases due to the extremely low levels of MCOC that have been found in surface water during previous quantitative range studies conducted by the U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM). Therefore, USACHPPM (2005) has recommended that this pathway only be evaluated when there is evidence that the surface water body is used regularly for swimming.

2.2.2 Exposure to Groundwater

For human receptors to contact MCOC through the groundwater pathway, there must be an aquifer, a

drinking water well, or discharge to a stream or spring that is used as a drinking water source. The USEPA (1991) requires the identification of water wells, both public and private, within four miles down gradient of the potential MCOC source area. For the Phase I Assessments, wells are identified within four miles of the potential MCOC source area boundary.

2.2.3 Surface Soil

The surface soil pathway is not to be evaluated unless potential off-range human or ecological receptors are present within 200 feet of a suspected source of MCOC. This determination is based on USEPA guidance (1991). In general, the results of a variety of range studies indicate that the likelihood of encountering potential source-receptor interactions through the soil pathway is extremely low. Also, while it is generally acknowledged that dermal absorption of substances in surface soil may be occurring in terrestrial ecological receptors, the methodology for quantifying this pathway is not currently available. Therefore, although the surface soil pathway may be complete, it is not evaluated by convention, as indicated in the conceptual site model (CSM) figures in Section 5.

2.2.4 Air Emissions

Air emissions from detonating military munitions have been evaluated under a variety of studies conducted by the DoD and the Army. These studies indicate that off-range receptor exposure to MCOC via the air pathway does not pose an unacceptable level of risk. Therefore, the USAEC has decided on a programmatic basis not to evaluate the air emissions migration pathway further during the Phase I Assessment. Should additional information become available that identifies potential problems associated with the air emissions migration pathway, this decision will be re-evaluated.

2.2.5 Potential Receptors

Receptors are organisms (human or ecological) that contact a chemical or physical agent in the environment. For the purposes of the Phase I Assessment, receptors are generally limited to off-range human receptors (workers, residents, and recreational users [including trespassers]) and off-range ecological receptors (threatened and endangered species, wetlands, fisheries, and other ecological receptors of concern or sensitive environments specific to an installation). Ecological receptors should include the identification and location of sensitive terrestrial/avian environments within one-half mile of the potential source areas and fisheries and surface water sensitive environments up to 15 miles downstream of the probable point of entry (USACHPPM, 2005; Malcolm Pirnie, 2005). For the purposes of the Phase I Assessments, sensitive environments are considered surrogates for ecological receptors. Guidance on identifying a sensitive environment was obtained from Exhibit 1-1 of the USEPA guidance (1997).

2.2.5.1 Consumption of Ecological Receptors

Studies conducted by the USACHPPM and other organizations indicate that the uptake and bioaccumulation of select MCOC (e.g., explosives) in terrestrial receptors do not pose a viable health risk to off-range receptors. Therefore, without a viable health risk (source), a potential source-receptor interaction pathway associated with the consumption of terrestrial receptors (e.g., deer) becomes irrelevant and is excluded from the ORAP.

These studies also show that deer and other wildlife species exposed to higher levels of MCOC in soil, including areas around explosive manufacturing areas, do not contain detectable levels of military unique compounds. Based on the data gathered during these studies, and considering the conservatism related to the risk assessment process, the health risk associated with consuming deer and other game harvested off-range is no greater than with harvesting game on-range. Therefore,

deer, other wildlife, and even livestock are programmatically excluded.

The inclusion of fish as a potential pathway / exposure point via the food chain is supported by USACHPPM. This assumption is based on the theory that if MCOC are present in a water body, fish have a more intensive, long-term exposure potential than terrestrial receptors, which may only come into contact with the contamination during incidental, short-term exposures.

2.3 Summary of Data Collection Efforts

Four primary sources of information were researched as part of the data collection effort for the Phase I Assessment:

- DoD data repositories and databases (e.g., ARID-GEO, Technical Information Center, Range Facility Management Support System [RFMSS])
- Off-installation / publicly available data repositories and databases (e.g., South Carolina Department of Health and Environmental Control [SCDHEC] and South Carolina Department of Natural Resources [SCDNR] geographic information system [GIS] databases)
- Installation data repositories and databases (e.g., McCrady Environmental and Natural Resources Office; Fort Jackson Directorate of Plans, Training, Mobilization, and Security [DPTMS])
- Personnel interviews and windshield tour (e.g., McCrady Environmental/Conservation Manager, McCrady RFMSS GIS Analyst, Fort Jackson DPTMS Chief)

Prior to the site visit, information on McCrady Training Center and the surrounding area was obtained from centralized databases and assembled into several profiles. Data gaps regarding military munitions usage and off-range receptors were identified during this effort. The site visit objectives were to confirm/verify the previously collected information and to fill data gaps. RFMSS data on munitions usage for 1 January 2004 to 18 May 2007 were obtained, along with data on off-range receptors to the south, southwest, southeast, and west of McCrady Training Center. Interviews with personnel from McCrady Training Center and Fort Jackson also provided useful information (see **Appendix B**). All of this information was used to construct the CSM profiles and figures presented in Section 3 and Section 5, respectively.

Appendix B provides a complete list of references used throughout the Phase I Assessment.

3.0 Conceptual Site Model Profiles

Section 3 provides a description of the installation and its environment based on information obtained during the Phase I Assessment process. The section includes five profile types:

- Facility Profile: Describes man-made features and potential sources (e.g., the current and historical installation area/layout and the munitions type/usage and MCOC associated with the operational range area).
- Physical Profile: Describes physical features/factors that may affect release, transport, and access of potential MCOC (e.g., meteorological data, topography, geology, hydrogeology, and surface waters and water resource use) and associated MCOC release mechanisms / pathways.
- Munitions Release / Migration Profile: Describes potential release mechanisms and migration pathways based on the source and type of potential MCOC and their interaction with the physical environment.
- Land Use and Human Receptor Profile: Provides information used to identify and evaluate the applicable exposure scenarios, human receptors, and receptor locations.
- Ecological Profile: Describes natural habitats of the installation and associated ecological receptors.

3.1 Facility Profile

3.1.1 Current and Historical Range Usage and Layout

McCrady Training Center is located in Columbia, SC, in Richland County. The training center comprises approximately 15,267 acres of the southeastern portion of Fort Jackson. The Department of the Army owns the land, which has been licensed to the SCARNG since 1943. **Figure 1-1** illustrates the general location of McCrady Training Center.

According to ARID-GEO (2006), 62 ranges are located at McCrady Training Center, encompassing 14,895 acres (**Figure 1-2**). The total operational range area was derived from the Operational Use Area (total range area) acreage as reported in ARID-GEO (2006). The cantonment area, which is situated in the southeast portion of the training center, comprises the 416 nonoperational acres of the training center (ARID-GEO, 2006).

Table 3-1 presents the types of ranges currently utilized at McCrady Training Center as defined by ARID-GEO (2006). The number of ranges and total acreage per range type are also provided.

Table 3-1: McCrady Training Center Operational Ranges

Range Type	Number of Ranges	Total Acreage
Tank Scaled Range (1:5-1:60)	1	253.46
Light Anti-Air Weapon Range	1	8.70
Pistol Qualification Range	1	3.35
Record Firing Range	1	40.80
Zero Range	1	3.69

Range Type	Number of Ranges	Total Acreage
Military Operations in Urban Terrain (MOUT) Facilities	1	21.30
Light maneuver/training area	9	2,327.37
Heavy maneuver/training area	32	9,500.30
Miscellaneous training area	14	2,691.33
Training Area Tank Trails, Surface	1	44.79
Total	62	14,895.09

Source: ARID-GEO (2006)
Note: The total operational range area was derived from the Operational Use Area (total range area) acreage as reported in ARID-GEO (2006).

Many of the operational ranges at McCrady Training Center have seen significant historical use. Historical military munitions use at McCrady Training Center was documented through a review of historical range maps. **Figures 3-1**, **3-2**, **3-3**, and **3-4** illustrate historical munitions usage from the years 1946, 1949, 1956, and 1969, respectively. As shown in these figures, the majority of historical firing points at McCrady Training Center were located along the southern and eastern edges of the operational area. Most of the ranges depicted in these figures are small arms ranges. Multiple historical artillery impact areas also overlap portions of McCrady Training Center, as evidenced by the artillery ranges shown on historical maps. **Figure 3-1** depicts a rifle grenade range along the southern installation boundary. **Figure 3-2** shows a mortar range just north of the cantonment area, and a mortar training area is depicted in **Figure 3-3**. **Figure 3-3** also shows range fans from 73 historical ranges utilized at Fort Jackson in the 1950s, including those licensed to the SCARNG. This illustrates that at least some historical military munitions usage occurred over virtually all of McCrady Training Center. As seen in **Figure 3-4**, by the late 1960s, firing points at McCrady Training Center were concentrated along the northern boundary of the cantonment area and the eastern boundary of the installation.

The 62 operational ranges at McCrady Training Center are discussed below according to range type. Areas of heavy historical munitions use, suspected dudded areas, and locations of artillery and mortar firing points and demolition areas were also considered when identifing potential source areas where limited or no munitions are used currently. Range types are shown in **Figure 3-5**.

Firing Ranges

There are two firing ranges at McCrady Training Center, totaling approximately 262 acres. These ranges were identified as firing ranges in ARID-GEO (2006), and use of medium and/or large caliber munitions was verified using RFMSS data. Small caliber munitions are also used at both of the firing ranges, and pyrotechnics/obscurants are used at one range.

Small Arms Ranges

There are three small arms ranges at McCrady Training Center comprising approximately 48 acres. Two of the three are located in the western portion of Fort Jackson's operational range area, as shown in **Figure 3-5**. The third small arms range is a pistol qualification course classified as a firing range in ARID-GEO (2006); however, RFMSS data indicate that small caliber munitions are the only munitions used at this range. In addition to small caliber munitions, fuzes (practice) are used at one of these ranges with the M69 Practice Hand Grenade, and munitions identified as unknown are utilized at each of these ranges.

Training Areas

McCrady Training Center includes 57 training areas covering approximately 14,585 acres. Fourteen of these training areas, totaling 2,652 acres, are non-live-fire maneuver and training areas where limited or no current munitions use occurs and no historical munitions usage has occurred.

Historical and/or current training involving the use of munitions has been identified at the other 43 training areas, totaling 11,933 acres. Eighteen training areas, including 16 training areas with historical munitions usage, are currently used for training activities involving the use of munitions at artillery or mortar firing points and/or suspected dudded areas, as shown in **Figure 3-5**. Two of the training areas that received heavy historical usage also contain demolition areas. According to the McCrady Training Center RFMSS GIS Analyst, one of these demolition areas is temporary. RFMSS data indicate that use of this temporary demolition area began in 2007.

3.1.2 Munitions Types and Usage

Munitions Types

Each of the following munitions classes has been used at McCrady Training Center:

- **Small caliber munitions**: These are used in small arms, which typically have a muzzle diameter of up to .50-caliber or 0.5 inches. Projectiles are typically solid and composed of lead cores with copper alloy jackets. Small caliber practice munitions (commonly referred to as blanks) contain no projectile. Additionally, in an attempt to reduce lead usage, a number of installations have replaced traditional bullets with lead-free tungsten composite rounds. RFMSS data indicate that tungsten rounds have been used at one of McCrady Training Center's small arms ranges and at one of its firing ranges.
- **Medium and large caliber munitions**: These are used in weapons systems that employ projectiles larger than .50-caliber, with sizes ranging from 20 to 60 millimeters (mm) for medium caliber and greater than 60 mm for large caliber. These projectiles are typically comprised of hollow iron alloys that contain a detonator and an explosive charge. These munitions may be live, practice, or inert.
- **Pyrotechnics and obscurants**: These devices give off smoke, light, heat, and/or noise when activated. Common munitions in this category include smoke grenades, artillery simulators, ground burst simulators, hand grenade simulators, and booby trap simulators.
- **Other weapons systems**: Hand grenades, bombs, rockets, missiles, and mines all fall into this category. Generally, these munitions may be found at live-fire ranges or impact areas. Items such as detonation cord and charges may be used in demolition areas. These munitions may be live, practice, or inert.

Munitions Usage

Munitions data (e.g., RFMSS) collected during the site visit provide information on the types and number of rounds fired at McCrady Training Center since 2004. The estimated number of rounds for each munitions class expended at McCrady Training Center from 1 January 2004 to 18 May 2007 is summarized in **Table 3-2**. The munitions expended are presented by range type. Munitions currently used in the training areas include demolition materials used at the demolition areas and large caliber munitions used at artillery firing points. This table does not include munitions that are used in areas of Fort Jackson not licensed to SCARNG. Approximately 6.6 million total rounds of military munitions were utilized during this time period. Over 95 percent of these were small arms rounds, including approximately 18,000 small arms tungsten rounds.

Table 3-2: McCrady Training Center Munitions Data Summary
(rounds in thousands)

Munitions Type	Live-Fire Rounds	Practice/Blank Rounds	Total Rounds
Firing Ranges			
Small Caliber	3,800	1.8	3,800
Medium Caliber	220	8.2	230
Large Caliber	5.3	0	5.3
Pyrotechnic/Obscurant	.32	0	.32
Total	*4,000*	*10*	*4,000*
Small Arms Ranges			
Small Caliber	2,600	13	2,600

Total	*3.1*	*0*	*3.1*
All Ranges			
Total	**6,600**	**33**	**6,600**

McCrady Training Center contains a site where munitions were utilized or disposed of that is being addressed under Fort Jackson's Resource Conservation and Recovery Act (RCRA) Part B permit issued by the SCDHEC in September 1991. Although this area is a potential source of MCOC, it is not evaluated under the ORAP because it is addressed under the conditions of the permit. Permitted open burn (OB) / open detonation (OD) areas are programmatically excluded from ORAP because the conditions of their permit address potential MCOC migration from these areas. This site is briefly described here for informational purposes only.

Wonsan Explosive Ordnance Disposal Site

Fort Jackson historically utilized two sites (Wonsan and Inchon) for disposal of explosive ordnance by OB and OD. The Inchon Explosive Ordnance Disposal (EOD) site is located on the portion of Fort Jackson that is not licensed to the SCARNG and, thus, is not discussed further in this report. The Wonsan EOD site is located approximately 600 feet east of Division Road between Colonels Creek to the north and Jumping Run Creek to the south. The site consists of two areas separated by an east-west firebreak: a one-acre area north of the firebreak and a two-acre area south of the firebreak. The Wonsan EOD site was used by the 48th EOD Detachment to dispose of unserviceable ammunition from 1961 to 1978. Disposal consisted of burning small arms ammunition in trenches and detonating larger ordnance in pits. The Wonsan EOD site is designated as Solid Waste Management Unit 12 in Fort Jackson's Installation Restoration Program. Four field events (in 1991, 1993, 1999, and 2000) were conducted to support a RCRA Facility Investigation. Samples were collected from shallow soil, subsurface soil, surface water, and groundwater and analyzed for a variety of analytes, including explosives and metals. Groundwater concentrations were compared to the National Drinking Water Action Level of 15 parts per billion (ppb) for lead and the 2000 USEPA Region 9 Preliminary

Remediation Goals for Residential Soil and Tap Water. Soil concentrations were compared to USEPA Ecological Screening Values for surface soil (1999). The primary constituents of concern for surface soil were determined to be chromium and lead. A screening level ecological risk assessment was performed in accordance with USEPA guidance (1997). This assessment determined that MC present in the soil and groundwater at the Wonsan EOD site do not pose a threat to human health or the environment; however, potential unexploded ordnance (UXO) that remains in the soil at the site may pose a safety risk. Additionally, it should be noted that some comparison criteria referenced in this study may be outdated. Fort Jackson is implementing land use controls to prevent access to this site (LAW, 2003; USAEC, 2005).

3.1.3 Potential MCOC

Based on a review of the data collected for the Phase I Assessment (e.g., GIS data, RFMSS data, historical range maps, site visit interviews with range and environmental personnel), numerous potential current and/or historical source areas for off-range releases were identified at McCrady Training Center. MCOC sampling data for certain portions of the installation were identified during the data collection and reviewed for this Phase I Assessment and are summarized below.

White Phosphorus Wetland Storage Installation Assessment (USACE, 1993)

The U.S. Army Corps of Engineers (USACE) performed a White Phosphorus Wetland Storage Installation Assessment at Fort Jackson in 1993 to determine whether white phosphorus (WP) was present in areas potentially attractive to wildlife, particularly waterfowl. Sediment samples were collected from 12 locations around Fort Jackson that were deemed most likely to store WP based on historical or current use of WP-containing munitions. Although none of these samples were taken on land that is licensed to the SCARNG, three of the sampling locations were located in the northwestern portion of the Weston Lake recreational area. This area is down gradient from three of the SCARNG ranges, as well as Fort Jackson's most heavily used impact area. None of the samples collected from any of the 12 locations contained WP above the analytical detection limit of 0.00096 milligrams per kilogram (mg/kg) (wet weight). The report concluded that the risk to waterfowl from WP storage in the Fort Jackson wetlands is negligible (USACE, 1993). Additionally, a summary report issued by USACE in 1996 stated that out of 39 samples collected at Fort Jackson, none contained WP levels over 0.00096 mg/kg. This report did not specify whether these sampling locations included samples taken from McCrady Training Center; however, Fort Jackson and McCrady Training Center have received similar historical use.

Small Arms Ranges Study (Bricka, 2002)

Mississippi State University staff, headed by Dr. R. Mark Bricka, performed a study from 2001 to 2002 to evaluate the potential of off-installation migration of MCOC, particularly metals, from 14 of the small arms ranges located in the western portion of Fort Jackson's operational range area, within the Gills Creek watershed. This study involved the collection of surface and subsurface soil samples from several ranges, as well as surface water and sediment samples from the creeks that drain the small arms ranges (i.e., Bynum, Rowell, and Mack creeks, which drain into Gills Creek). The data showed that soil containing elevated concentrations of lead is present on the small arms ranges. Also, because the small arms ranges contain sandy soils and are intersected by a network of creeks, the potential for erosive conditions is high, so that lead-contaminated soil was shown to be entering several of the smaller creeks that drain into Gills Creek. The results of the sediment sampling indicated that from Gills Creek sediment travels into Boyden Arbor Pond, primarily during larger rain events. However, the authors of the study stated that "it is also suspected that little lead is moving off post because of the size of Boyden Arbor Pond and that the sediment lead levels at the discharge end of the pond are quite low." The lead concentration in a sediment sample collected at the discharge

end of Boyden Pond was 6.4 mg/kg. Surface water sampling results showed that lead concentrations in all of the filtered water samples (total of 57 samples at 17 stream transect locations) and all but 10 of the unfiltered samples (total of 56 samples at 17 stream transect locations) were below 0.065 milligrams per liter (mg/L), the federal water quality Criterion Maximum Concentration (CMC). The CMC is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed briefly without resulting in an unacceptable effect.

To determine whether MCOC are migrating off-range, data must be compared to the Criterion Continuous Concentration (CCC), which is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed indefinitely without resulting in an unacceptable effect. The USEPA mandates that the CCC for lead is 0.0025 mg/L using a hardness of 100 mg/L. The appropriate CCC at McCrady Training Center would vary by range, based on hardness values ranging from 10 mg/L to over 100 mg/L (USATC, 2005). According to Dr. Bricka (2002), the detection limit used for lead in this study was approximately 0.010 mg/L, which is above the CCC for lead. Because detection limits do not allow for a comparison to chronic criteria, this study does not rule out off-range migration of metals MCOC from the small arms ranges in the Gills Creek watershed. However, it does show that lead levels downstream from these ranges are substantially lower than in adjacent water bodies.

Small Arms Ranges Study (USATC, 2005)

The U.S. Army Aberdeen Test Center also performed a study to evaluate the potential of off-installation migration of MCOC, particularly metals, from 14 of the small arms ranges located in the western portion of Fort Jackson's operational range area, within the Gills Creek watershed. This study included the westernmost of the two small arms ranges licensed to the SCARNG. The study showed that there was very heavy erosion on the hillside, or natural berm, bordering most of the southern range boundary. This erosion washes into a swale that drains to the west and transports sediment out through the southwest corner of the range where there is an opening in the berm. According to the study authors, a storm water control structure is not in place at this range. Additional runoff from the firing points leaves the range at its northwest corner and drains directly to Bynum Creek, a tributary of Gills Creek. Analytical results from three rounds of ambient surface water sampling suggest that the small arms ranges were contributing to low-level lead concentrations in ambient surface waters adjacent to the range areas. An ambient surface water sample was collected at the point where overland flow from four small arms ranges in the Bynum Creek subwatershed, including the westernmost SCARNG range, discharge into Bynum Creek. This sample contained a total of 8.0 ppb of dissolved lead and 23 ppb of total lead. This location was cited in the report as a potential storm water monitoring location.

Bynum Creek flows through marshy areas before discharging into Gills Creek, which is characterized as a heavily vegetated, marshy area. Gills Creek then flows through Boyden Arbor Pond prior to flowing off the installation. These two environments (marsh and pond) act as natural filters to slow down and trap sediments by a decrease in water velocity and a subsequent decrease in the water's ability to carry sediment loads, as well as by the large amount of organic matter in the marshes that may bind or adsorb metals in runoff waters. According to the study authors, "…there are filtering mechanisms in place at Fort Jackson that are mitigating lead and total suspended solids concentrations in storm water runoff flowing from the small arms range area in the Gills Creek watershed."

The study also included the installation of three shallow groundwater monitoring wells (MW-1, MW-2, and MW-3) at a small arms range approximately two miles southwest of the SCARNG small arms

ranges to depths of approximately 13.5 to 14.5 feet below ground surface (bgs). Dissolved lead concentrations at MW-1 were as high as 2,900 ppb, while maximum dissolved lead results from MW-2 and MW-3 were 6 and 30 ppb, respectively. The core section for MW-1 showed a sandy profile, while cores for MW-2 and MW-3 indicated that there is a localized confining condition (i.e., clay lens) that prevents direct communication between the ground surface and groundwater. Groundwater samples were also collected from two potable water supply wells located near the small arms ranges. These wells are screened in the Middendorf Formation at depths of 174 and 105 feet bgs. Lead concentrations for groundwater samples from both of the wells were lower than the 15 ppb lead National Drinking Water Action Level. The study concluded that groundwater impacts are limited to the shallow base flow discharging to the creeks.

Fort Jackson Site Inspection Report (Malcolm Pirnie, 2006)

Surface soil MCOC sampling was conducted at several closed small arms ranges within the Fort Jackson cantonment area under the Military Munitions Response Program (MMRP), as part of a Site Inspection in April/May 2005. The closed small arms ranges included a transition range, a pistol range, and overlapping range fans from 1000-inch and landscape target ranges. These ranges, which encompass approximately 475 acres, were used from the 1940s through the 1970s for small arms training. The firing lines and target areas for the ranges account for a much smaller area (approximately 80 acres). Historical information provided general locations of former range features (e.g., firing lines/lanes, target areas); however, these features are no longer discernable at the sites. A combination of technologies was used to field determine biased sampling locations, including visually confirming historical range feature locations (e.g., firing lines, target areas, backstop berms), locating concentrations of bullet fragments/casings using an all-metals detector, and X-ray Fluorescence screening at potential sampling locations to determine areas of higher lead concentrations. Analytical data indicated that total lead concentrations were detected below the USEPA Region 9 Residential Preliminary Remediation Goal of 400 mg/kg for all 51 surface soil samples collected.

Table 3-3 summarizes the potential MCOC (if identified) associated with each of the range types described in Section 3.1.1 and whether or not applicable sampling data, discussed earlier in this section, are available for that MCOC. **Table 3-3** also lists potential MCOC from historical munitions usage at McCrady Training Center. Small, medium, and large caliber ordnance, along with pyrotechnics, obscurants, and other types of munitions, have been used at McCrady Training Center. MCOC associated with each munitions class are discussed below.

- **Small caliber munitions**: Lead is the primary potential MCOC. Other metals, including antimony, copper, zinc, and tungsten, can also contribute to impacts to environmental media (soil, surface water, and groundwater) at small arms ranges. Nitroglycerin (NG) is a component of solid propellant for small caliber munitions; therefore, NG is considered a potential MCOC at small arms ranges firing lines with heavy firing, with very well defined pathways to off-range receptors, and for which a source of metals MCOC has also been identified. Small caliber blanks are not considered to be a source of MCOC.
- **Medium and large caliber munitions**: High explosives used in these munitions may result in the release of trinitrotoluene (TNT), cyclotrimethylenetrinitramine (RDX), and cyclotetramethylenetetranitramine (HMX). The propellants for these munitions may contain 2,4-dinitrotolulene (DNT), 2,6-DNT, and NG. NG is a component of solid propellant for medium and large caliber munitions, including shoulder fired anti-armor weapons. Therefore, NG is considered a potential MCOC at anti-armor ranges and artillery firing points.

- **Pyrotechnics and obscurants**: Perchlorate compounds are the primary MCOC associated with pyrotechnics. WP is frequently used as an incendiary and smoke-screening agent in training areas.
- **Other munitions**: Pentaerythritoltetranitrate (PETN) is a component of detonation cord and could be a potential MCOC at ranges where demolition training is performed. Additionally, the explosive components used in some of these munitions may result in the release of TNT, RDX, and HMX.

Table 3-3: Potential MCOC (Current and Historical) at McCrady Training Center

Range Type	Source Area / Munitions Types	Potential MCOC	Detected MCOC
Firing Ranges	Tank scaled range, anti-air weapon range	TNT, HMX, RDX, 2,4-DNT, 2,6-DNT, PETN, perchlorate, NG, lead, antimony, copper, zinc, and tungsten	No sample results available
Small Arms Ranges	Two small arms ranges in Fort Jackson's western operational area	TNT, lead, antimony, copper, zinc, and tungsten	Lead detected in nearby ambient surface water, surficial groundwater, sediments, and surface water downstream in the Gills Creek watershed (Bricka, 2002; ATC, 2005)
	Pistol qualification course	Lead, antimony, copper, and zinc	No sample results available
Training Areas	Artillery/mortar firing points; demolition areas; areas that contain historical artillery impact areas or firing points, including suspected dudded areas resulting from historical use	TNT, HMX, RDX, 2,4-DNT, 2,6-DNT, PETN, perchlorate, and NG	No sample results available
	Areas with no current source and with limited historical munitions usage (i.e., overlapping surface danger zones for small arms ranges)	None	

A prioritized list of munitions containing perchlorate has been developed by USAEC and USACHPPM (2005). These munitions account for 96 percent of the U.S. Army's annual perchlorate expenditures. A review of McCrady Training Center RFMSS data indicates that these munitions have been used in significant quantities during training activities; therefore, perchlorate has been included in the list of potential MCOC evaluated for McCrady Training Center.

3.2 Physical Profile

3.2.1 Meteorology

McCrady Training Center has a temperate continental climate with hot, humid summers and mild winters. This southern temperate region can experience temperatures ranging from below freezing to greater than 100 degrees Fahrenheit (ºF); however, there is a relatively narrow annual temperature range, from a mean daily temperature of 81ºF in July to 44ºF in January (Gene Stout & Associates, 2004). Annual precipitation is approximately 46 inches. July and August are the wettest months, with approximately 5.5 inches of precipitation each month. Tropical storms producing heavy rainfall occasionally occur during late summer and early autumn. Wind speeds peak at approximately nine miles per hour in spring, and the general wind direction is from the southwest. Snowfall is rare and generally results in little, if any, accumulation (USATHAMA, 1980).

3.2.2 Topography

Gently to moderately rolling, moderately dissected high plains occupy most of McCrady Training Center. These high plains are interrupted by the nearly flat alluvial plains of Colonels Creeks and its tributaries. Elevations in the main portion of McCrady Training Center range from 160 feet above mean sea level (msl) at the outlet point of Colonels Creek to 440 feet above msl in the high plains. Elevations at the small arms ranges located in the western portion of Fort Jackson's operational range area are around 300 to 375 feet above msl. The highest point at McCrady Training Center is located at the ranges northwest of Weston Lake, where elevations reach up to 540 feet above msl (Fort Jackson ITAM, 2006). Slopes are predominately three to eight percent; however, along narrow stream valleys, slopes may exceed 15 percent (Gene Stout & Associates, 2004).

3.2.3 Geology

The geology of South Carolina is characterized by two principal physiographic and geologic provinces, the crystalline rocks of the Piedmont physiographic province and the unconsolidated sediments of the Coastal Plain. The boundary between the Piedmont and the Coastal Plain is marked by the fall line, which represents a geologic unconformity and occurs approximately four miles west of the Fort Jackson cantonment area (USATHAMA, 1980; Newcome, 2003; Wikipedia, 2007). Along the fall line, rapids occur on all of the major rivers as they pass from the harder metamorphic rock of the Piedmont (upland region) to the more easily eroded clays and shales of the Coastal Plain (Microsoft, 2007).

McCrady Training Center lies on the northwestern edge of the Coastal Plain province, a region of low to moderate relief and gently rolling plains, known as the Sand Hills. The principle geologic unit in the Sand Hills is the Upper Cretaceous-age Tuscaloosa Formation (also referred to as the Middendorf Formation), which outcrops over most of McCrady Training Center and consists of marine deposits of light-colored sands and kaolin clays. Most soils at McCrady Training Center are formed from sediment of the Tuscaloosa. A layer of Quaternary sand terrace overlies the Tuscaloosa Formation, which lies unconformably on the peneplained surface of crystalline rocks (Gene Stout & Associates, 2004). The Tuscaloosa complex generally consists of clay strata overlying unconsolidated sands and extends to depths of 90 to 300 feet bgs (USATHAMA, 1980).

3.2.4 Hydrogeology

The Tuscaloosa Formation consists of interbedded, generally unconsolidated, fine to coarse sand and clay, causing groundwater to occur under both unconfined and confined (i.e., artesian) conditions. Groundwater occurs under water table conditions in the upper part of the zone of saturation. At a

depth of about 99 to 251 feet, permeable sand zones frequently are overlain by less permeable clay zones, and the groundwater exists under artesian conditions (Gene Stout & Associates, 2004). At some places, a perched water table condition exists due to clay and sandy clay layers, which underlie the sands at many places (USATHAMA, 1980). The vertical migration of groundwater may be limited in some areas by the presence of a perched water table, as is evidenced by sampling results from shallow monitoring wells, discussed in Section 3.1.3. There is extensive communication between surficial groundwater and surface water, as the shallow, perched aquifer discharges as base flow into the network of small creeks that runs through much of McCrady Training Center's operational range area. Groundwater within the surficial aquifer generally flows in similar pathways as surface water, as shown in **Figure 3-6**.

Aquifers southeast of the fall line discussed in Section 3.2.3 include Upper Cretaceous and Tertiary formations (SCDNR, 2003). The primary groundwater resources for water supply wells in Richland County, SC, are the Cretaceous Middendorf and Black Creek formations (SCDNR, 2003). The deep regional aquifer at McCrady Training Center occurs in the basal Middendorf sand formation. Well log data from the state of South Carolina indicate that a confining unit approximately 50 feet thick occurs at a depth of approximately 175 feet over parts of McCrady Training Center (LAW, 2003). Regional groundwater movement arcs in a south to southeasterly direction across the main portion of McCrady Training Center toward the Wateree River to the east (Newcome, 2003). Regional groundwater flow is shown in **Figure 3-7**. Although McCrady Training Center is not located within a recharge area for a sole-source aquifer, it is within the recharge area for the Middendorf aquifer, which is widely used for drinking water (SCDNR, 2003; Gene Stout & Associates, 2004). According to the SCDNR (2003), approximately 600 groundwater wells were completed in sand beds of the Cretaceous and overlying formations from 2001 to 2002. SCDHEC references (2006) confirm that the major drinking water aquifers in South Carolina are in the subsurface of the Coastal Plain.

There are three drinking water wells located at McCrady Training Center, two of which are located in the nonoperational cantonment area. These wells have depths of 324 and 330 feet, with static water levels of 78.5 and 80.3 feet, respectively. A 144-foot-deep drinking water well is also located at the larger of the two firing ranges just east of Weston Lake (Fort Jackson ENRD, 2007). **Figure 3-6** depicts wells located at and down gradient from McCrady Training Center.

3.2.5 Soils

The major soil association at McCrady Training Center is the Vaucluse-Ailey-Pelion association, which is found along most of Colonels Creek. This association consists of well-drained to moderately well-drained soils that have a sandy surface layer and a loamy subsoil. These soils have a low potential for erosion unless disturbed or located on a steep grade subject to plentiful rainfall (USAEC and USDA, 2001). Five other soil series are present to a lesser extent at McCrady Training Center, the majority of which are sand or sand/loam combinations (USAEC and USDA, 2001). The high sand content of soils at McCrady Training Center promotes leaching of minerals, reduces water retention, and increases susceptibility to soil erosion (ATC, 2005). Strong slopes and an abundance of rainfall add to the potential for erosion. The SCARNG is working with the South Carolina Natural Resources Conservation Service to implement erosion control measures at identified erosion sites, which are shown in **Figure 3-8**. Planned erosion control measures include seeding, rock barriers, and construction and installation of drainage waterways, water bars, and sediment basins (SCARNG, 2005).

3.2.6 Surface Water

McCrady Training Center is located within the Santee River Basin and the Congaree River subbasin. The majority of McCrady Training Center is located within the Colonels Creek watershed. The training center's outlying ranges also lie within two additional watersheds, as shown in **Figure 3-9**. These watersheds are drained by Gills and Cedar creeks. Each watershed is described below.

Colonels Creek Watershed
The headwaters of Colonels Creek originate in the northwestern portion of McCrady Training Center. This is a predominately wooded watershed. Colonels Creek drains the majority of the training center, including the cantonment area. Colonels Creek exits McCrady Training Center at the southwestern boundary of the cantonment area and flows southeast to the Wateree River, a tributary of the Congaree River.

Gills Creek Watershed
Gills Creek flows through the northwest portion of Fort Jackson and drains the two SCARNG small arms ranges that are located in this area. Gills Creek flows southwest to Forest Lake and Lake Katherine, eventually draining into the Congaree River. Gills Creek is primarily an urban watershed and has been identified as very polluted. Pollution in this watershed stems from typical pollutants found in urban settings: petroleum products, oil and grease, sediments, trash, and sewage. The portion of the Gills Creek watershed situated on Fort Jackson is relatively pristine when compared to the area located in the more urbanized portion of Columbia (Gene Stout & Associates, 2004; SCDHEC, 1997).

Cedar Creek Watershed
Cedar Creek drains the SCARNG firing ranges and training areas located immediately northwest and east of Weston Lake. Cedar Creek flows southward through the Weston Lake recreation area, which is located on Fort Jackson's nonoperational area, and eventually enters the Congaree River.

There are 26 lakes, ponds, and impoundments on Fort Jackson. These water bodies range in size from 0.5 to 173 acres; however, most are smaller than 35 acres (Gene Stout & Associates, 2004). Five ponds and two lakes are adequate for intensive fisheries management, including Odom Pond, which covers 4.6 acres in the west-central portion of McCrady Training Center and drains to Colonels Creek (Gene Stout & Associates, 2004; USAEC and USDA, 2001). In addition to Odom Pond, other large ponds at McCrady Training Center include Davis Pond (20.4 acres), Varn Lake (6.0 acres), and Chavers Pond (2.2 acres), all of which are located on or in proximity to tributaries of Colonels Creek (USAEC and USDA, 2001). These water bodies and the other remaining lakes and ponds at McCrady Training Center are maintained for waterfowl habitat, recreation, and aesthetics.

All creeks and streams leaving McCrady Training Center eventually flow into either the Wateree River or the Congaree River (**Figure 3-10**). These rivers meet about 16 miles southeast of the installation, where they form the Santee River, the principal regional waterway. The Santee River continues in a southeasterly direction, eventually emptying into the Atlantic Ocean south of Georgetown, SC (Gene Stout & Associates, 2004).

3.2.7 Vegetation

Vegetation at McCrady Training Center consists of mainly longleaf pine (*Pinus palustrus*) and scrub oak (*Quercus laevis*) with other mixed hardwoods and pines. The vegetation at McCrady Training Center is abundant and diverse, due largely to its relative isolation from urban development. As

observed during the site visit, forested areas occupy the majority of the installation, with the exception of the firing ranges and the cantonment area. Other types of cover include permanent streams, saturated wetlands, and urban or barren lands (USAEC and USDA, 2001). Barren sandy areas have been identified as erosional areas and are shown in **Figure 3-8**.

3.3 Munitions Release / Migration Profile

MCOC from source areas, as described in **Table 3-3,** potentially impact source media, including soil (e.g., found in impact berms, firing points, localized impact areas surrounding targets, and suspected dudded areas) and surface water / sediment (e.g., via direct or erosional deposition into streams and/or wetlands).

MCOC can be released to groundwater (down gradient), surface water / sediment (downstream), off-range soil, or the food chain via a variety of release mechanisms. Release mechanisms for soil may include leaching from soil to groundwater or erosion and runoff to off-range surface soil or to nearby streams. Once potential MCOC are deposited in surface water / sediment, they have the potential to migrate downstream, recharge the shallow groundwater, or be taken up by aquatic plants or animals.

Release mechanisms that enable transport of potential MCOC from soil or surface water / sediment source areas toward off-range receptors are present in the operational range areas at McCrady Training Center. Both surface water and surficial groundwater pathways were identified for soil sources at all of the firing ranges and small arms ranges and within some of the training areas at McCrady Training Center.

Potential MCOC may be directly or indirectly deposited into the many wetlands and streams that drain the operational ranges, recharge the surficial and bedrock groundwater aquifers, and serve as plant and animal habitat. As described in Section 3.2.6, McCrady Training Center ranges lie within three watershed drainage areas that provide potential avenues for MCOC to migrate off-range via surface water and sediment, as shown in **Figure 3-9**. Receptor interactions are considered up to 15 miles from where these surface watercourses exit operational range area, based on guidance developed by the USEPA for CERCLA Preliminary Assessments (1991) (**Figure 3-10**).

Potential MCOC that leach from soil may impact surficial groundwater. Surficial groundwater provides recharge for the extensive network of creeks and ditches throughout the operational area. Sampling data suggest that the deep, regional aquifer has not been impacted by MCOC (ATC, 2005). Localized confining conditions (i.e., clay lenses) may retard communication between the ground surface and groundwater in some areas, limiting the off-range migration of MCOC. Receptor interactions are considered up to four miles from where groundwater leaves operational range area, based on USEPA requirements (1991).

3.4 Land Use and Human Receptor Profile

3.4.1 Current Land Use

Land uses on McCrady Training Center include vehicle maneuvers, bivouac areas, landing zones, firing points, buffers, impact areas, timber production, fishing, and cantonment area (USAEC and USDA, 2001). The majority of land at McCrady Training Center is used for light or heavy maneuver training activities. Small, medium, and large caliber munitions firing and demolition operations are limited to a relatively small percent of the McCrady Training Center area. Approximately three percent of the installation acreage comprises the cantonment area, located in the southeastern corner

(USAEC and USDA, 2001). The cantonment area contains two drill pad areas, the 218th Regiment (Leadership) facilities, administrative facilities, the Unit Training and Equipment Site, U.S. Marine Corps Reserve facilities, and a Battle Simulation Center (USAEC and USDA, 2001).

Columbia is the capital of South Carolina and its largest city, making up over one-third of Richland County's population. The U.S. Census Bureau (2007) reported a 2000 population of 116,278 in Columbia, compared to 320,677 for Richland County. Columbia is comprised of highly urbanized developed land with the exception of Fort Jackson (including McCrady Training Center), which has been incorporated into the eastern city limits. The majority of McCrady Training Center is located approximately 15 miles east of Columbia's business district. Most of the area immediately surrounding McCrady Training Center is rural or undeveloped with natural woodlands.

3.4.2 Adjoining Areas of Concern

McCrady Training Center is comprised of approximately 15,267 acres within the eastern portion of Fort Jackson that are licensed to the SCARNG for training. Ranges in the remaining portion of Fort Jackson are operated by the U.S. Army Training Center. Fort Jackson's operational areas support a variety of activities, including live-fire weapons training, heavy and light maneuver exercises, dudded and non-dudded impact areas, and various specialty training courses, such as night infiltration and MOUT. Many of the operational ranges currently receive heavy usage by soldiers undergoing basic training, as Fort Jackson is the largest and most active initial entry center in the U.S. Army (GlobalSecurity.org, 2006). Fort Jackson's northeastern ranges contain the headwaters of Colonels Creek, which flows through the main portion of McCrady Training Center, as shown in **Figure 3-9**. These ranges constitute a potential source of MCOC that may be carried into McCrady Training Center and subsequently off-range. Potential MCOC source areas at both McCrady Training Center and Fort Jackson also drain to Cedar and Gills creeks, making it difficult to distinguish the original source of potential MCOC downstream. The Fort Jackson ranges have been evaluated in a separate ORAP Phase I Assessment (Malcolm Pirnie, year).

3.4.3 Current Human Receptors

Potential human receptors include residents (in nearby off-installation residential areas); workers (on-installation and in off-installation areas surrounding the installation); and fishermen and swimmers utilizing on-installation or nearby off-installation areas for recreational purposes. Potential human receptors include the following:

- Residential and commercial/industrial communities within four miles down gradient of current or historical source areas who utilize groundwater from the surficial aquifer, as shown in **Figure 3-6**, are receptors. These receptors are located primarily in rural communities south of McCrady Training Center.
- Recreational users of Varn Lake, Weston Lake, and other recreational ponds and lakes (that are downstream of potential MCOC source areas) in nonoperational areas of McCrady Training Center or Fort Jackson.
- Recreational users of off-installation designated recreational areas such as Murray Pond and Forest Lake, within 15 miles downstream of potential MCOC source areas, as shown in **Figure 3-10**.

3.4.4 Resource Use Location

Three drinking water supply wells are located at McCrady Training Center, as shown in **Figure 3-6**. Two of these wells comprise System 4070911, which provides the cantonment area with drinking water. These source wells are 330 and 324 feet deep, indicating that they are screened in the Middendorf Formation. Their static water levels measure 80.3 and 78.5 feet bgs. The third water supply well is 144 deep and is located at the larger of the two firing ranges just east of Weston Lake (Fort Jackson ENRD, 2007). This well supplies potable water to soldiers on-range during training activities.

Figure 3-6 depicts groundwater wells in the vicinity of McCrady Training Center. According to the McCrady Training Center Facilities Engineer, a public water system is not available in the area south of the cantonment area for approximately eight miles. Residents located along Leesburg Road, which forms the southern installation boundary, utilize groundwater as their source of potable water (LAW, 2003). The SCDNR database identifies groundwater wells in these areas, as well as in areas less than four miles down gradient from the firing ranges near Weston Lake. According to the SCDNR database (2003), domestic wells in the vicinity of McCrady Training Center draw from both the surficial aquifer and the deep regional aquifer.

Recreational areas at McCrady Training Center include swimming areas and fishing areas. Odom Pond is one of the main fishing areas and is large enough for fisheries management. The primary recreational area is Varn Lake, which is located in the cantonment area and supports 11 cabins and conference facilities (AKO, 2002). Additional recreational areas in the vicinity of McCrady Training Center include Weston Lake, located in Fort Jackson's nonoperational range area, which is a waterside recreation lake used by the surrounding community, with camping facilities, picnic shelters, a community house, a beach pavilion, and a swimming area (Gene Stout & Associates, 2004).

3.5 Ecological Receptor Profile

3.5.1 Sensitive Environments

McCrady Training Center contains 1,642 acres of wetlands (USAEC and USDA, 2001). Wetlands at McCrady Training Center consist primarily of bottomland hardwoods in narrow bands adjacent to streams and drainages. Vehicles and mechanized equipment must traverse wetlands on established roads and trails, and foot traffic through wetlands generally is not allowed during training activities (USAEC and USDA, 2001).

3.5.2 Habitat Type(s)

McCrady Training Center is located in the Sand Hills of the South Carolina Upper Coastal Plain physiographic province. The areas to the north, east, and south of McCrady Training Center are largely undeveloped, consisting of natural pine forest habitat, as well as creeks and wetlands areas. The remaining portion of McCrady Training Center borders Fort Jackson's operational area.

Longleaf pine forests found in the Sand Hills are home to the federally endangered red-cockaded woodpecker. Longleaf pine is prevalent at McCrady Training Center and provides what has become a scarce habitat for this species. McCrady Training Center has taken precautions to protect known locations of red-cockaded woodpecker populations by applying a 200-foot buffer zone and 0.5-mile restrictive foraging area to each cavity tree occupied or formerly occupied by a group of red-cockaded woodpeckers (USAEC and USDA, 2001). Weapons firing is prohibited in these areas, and maneuver training is limited to established roads (USAEC and USDA, 2001).

3.5.3 Ecological Receptors

Two federally listed endangered plant species, rough-leaved loosestrife (*Lysimachia asperulaefolia*) and smooth coneflower (*Echinacea laevigata*), occur at or in the vicinity of McCrady Training Center. Rough-leaved loosestrife is found just west of the installation boundary along Buffalo Creek. Smooth coneflower has been documented adjacent to Statue of Liberty Road in the northern portion of McCrady Training Center. **Figure 3-9** indicates the approximate locations of the two endangered plant species populations. Since these plants are located in narrowly defined areas within the operational training ranges, it is not expected that they would be found at off-installation locations. In addition to the smooth coneflower and the rough-leaved loosestrife, two other unlisted rare species occur at McCrady Training Center: the crested fringed orchid (*Pteroglossaspis ecristata*) and the Indian olive (*Nestronia umbellula*) (USAEC and USDA, 2001). The Nature Conservancy ranks both species as imperiled statewide (USAEC and USDA, 2001).

One federally listed endangered animal, the red-cockaded woodpecker, is a resident of McCrady Training Center. The red-cockaded woodpecker is endemic to the pine forests of the southeastern United States. It is found most commonly in longleaf pine ecosystems. Red-cockaded woodpecker distribution on McCrady Training Center is depicted in **Figure 3-9**. Due to the wide presence of the red-cockaded woodpecker on McCrady Training Center and the presence of similar habitat off-range and off-installation, it is expected that the red-cockaded woodpecker is present off-range as well. Two additional federally endangered species, the shortnose sturgeon (*Acipenser fulvescens*) and Canby's dropwort (*Oxypolis canbyi*), are found in the vicinity of McCrady Training Center but are not known to occur at the installation. The American Bald Eagle (*Haliaeetus leucocephalus*) , which is listed by the SCDNR as a state endangered species (SCDNR, 2006), is a transient visitor to the installation. No American Bald Eagle nests or permanent roost sites are known to occur on the installation.

3.6 Relationship of Potential MCOC Sources to Off-Range Human and Ecological Receptors

As summarized in **Table 3-3**, potential MCOC sources at McCrady Training Center have been identified at all of the installation's firing ranges and small arms ranges, as well as at a number of its training areas. The following discussion describes the relationship between potential MCOC sources present at a given type of range to off-range human and ecological receptors.

Firing Ranges

There are two medium and large caliber firing ranges at McCrady Training Center; both are located in the Cedar Creek watershed and fire into Fort Jackson's eastern dudded impact area. Significant UXO may exist in the dudded impact area, resulting from fired munitions items that failed to detonate. Incomplete detonation or breakup of the delivery system without detonation may also occur, leading to the survival of part or all of the explosive (USACE, 1999). Intact UXO may corrode or deteriorate over time, leading to explosive MCOC contamination in the dudded impact area. Portions of the two firing ranges lie partially within this dudded impact area and are shown as suspected dudded areas in **Figure 3-5**. Surficial groundwater or overland flow that discharges to surface water has the ability to carry potential MCOC from these firing ranges to Weston Lake. Although it is anticipated that much of the surficial groundwater flow from these firing range will discharge to Weston Lake prior to reaching off-installation area, MCOC from the firing ranges within the Cedar Creek watershed also have the potential to reach private domestic wells south of Weston Lake. **Figure 3-6** shows down gradient wells located within four miles of these ranges.

Small Arms Ranges

Three small arms ranges are located at McCrady Training Center. Two of these ranges are located in Fort Jackson's western operational range area, within the Gills Creek watershed. The other small arms range is situated east of Weston Lake in the Cedar Creek watershed.

As discussed in Section 3.1.3, two studies have been performed to evaluate the potential of off-installation migration of metals MCOC from the small arms ranges in the Gills Creek watershed. The conclusions reached in both of the studies are that surface water and surficial groundwater on the small arms ranges are impacted by lead, but that concentrations of metals are greatly reduced by the time they reach off-range areas. Surface water sampling completed for these studies utilized a 50.0 ppb maximum contaminant level, which is no longer used by SCDHEC. Therefore, the comparisons and conclusions presented by these studies cannot conclusively determine whether metals MCOC from the small arms ranges located in the Gills Creek watershed pose a risk to off-site receptors. Additionally, samples from this area have not been analyzed for explosive and perchlorate MCOC, which may be subject to different fate and transport mechanisms than metals MCOC. Therefore, a surface water pathway exists for these ranges, due to the presence of recreational areas downstream at Forest Lake, as shown in **Figure 3-9**. The majority of surficial groundwater from the SCARNG small arms ranges is expected to discharge into Gills Creek or Boyden Arbor Pond, which is located in Fort Jackson's cantonment area approximately three to four miles to the southwest. Surficial groundwater may travel as far as Forest Lake, as shown in **Figure 3-6.** Surficial groundwater is not considered to be a complete pathway for these ranges because no groundwater wells were identified within four miles down gradient.

The Cedar Creek watershed contains one small arms range. Surficial groundwater or overland flow that discharges to surface water has the ability to carry potential MCOC from this range to Weston Lake. If transported off-installation via surface water runoff or through infiltration or leaching into the groundwater, MCOC from the firing ranges within the Cedar Creek watershed have the potential to reach private domestic wells within four miles of source areas. **Figure 3-6** shows down gradient wells located south and southeast of Weston Lake.

Training Areas

Fifty-seven training areas are present at McCrady Training Center. Limited or no historical munitions usage has occurred at 14 of the 57 training areas, most of which were overlapped by safety fans for small caliber munitions ranges. Forty-one of the 57 training areas contain potential historical MCOC sources, based on the presence of historical impact areas or firing points. Eighteen training areas, including 16 of the training areas with potential historical sources, contain current potential MCOC sources consisting of artillery or mortar firing points, demolition areas, and/or suspected dudded areas.

Training Areas Containing Limited or No MCOC Sources

Limited or no historical munitions usage has occurred at 14 of the training areas present at McCrady Training Center, totaling 2,652 acres. Munitions are not used currently in these training areas. Historical munitions use consists primarily of overlapping safety fans for small arms ranges used from the 1940s to the 1970s. Given that these areas have not been used recently for munitions training and that most of the use was for small arms training, it is likely that only limited MCOC sources remain in these areas and transport of high concentrations of MCOC is unlikely.

This is supported by surface soil MCOC sampling that was conducted at several closed small arms ranges within the cantonment area at Fort Jackson under the MMRP, as part of a Site Inspection in

April/May 2005 (Malcolm Pirnie, 2006). Total lead concentrations were detected below the USEPA Region 9 Residential Preliminary Remediation Goal of 400 mg/kg for all surface soil samples collected. This sampling event is discussed in greater detail in Section 3.1.3.

Training Areas Containing Historical Potential MCOC Sources

Historical munitions use at 41 of the training areas is characterized as providing potential sources of MCOC based on the type and frequency of munitions use. Thirty-seven of these training areas are located in the Colonels Creek watershed; four are located within the Cedar Creek watershed. These training areas contain historical firing points for small, medium, and large caliber munitions or were utilized historically as artillery impact areas. This may have resulted in the presence of significant UXO. UXO may still exist in the subsurface if a fired munitions item failed to detonate. Incomplete detonation or breakup of the delivery system without detonation may also occur, leading to the survival of part or all of the explosive (USACE, 1999). Intact UXO may corrode or deteriorate over time, leading to explosive MCOC contamination in these areas. These areas are assumed to potentially contain a greater loading of MCOC than the training areas discussed in the two preceding paragraphs that were range fans for small arms ranges.

Two of the training areas with significant historical munitions use, both located in the Colonels Creek watershed, were used for live-fire training through the mid-1990s. One of these ranges, located near the south-central installation boundary, was used as a WWII machine gun range. According to Fort Jackson Range Control personnel, the dedicated impact area for this range was designated for a different function in 1987 and use of the range was terminated around 1994 or 1995 because it was not designed to current standards. The SCARNG is converting this range into a tank lane range. The other training area is adjacent to the cantonment area and was also used up until 1994, when use of live-fire was terminated because there was no dedicated impact area for the range. This range is still identified in ARID-GEO (2006) as a firing range; however, it is currently a MOUT facility where only small caliber blanks are used. The area is used frequently, although a portion is under construction by the SCARNG engineering battalion.

Surficial groundwater and/or overland surface flow or soil erosion mechanisms have the potential to transport MCOC from the ranges discussed above to a surface watercourse. Potential off-range surface water receptors have been identified in Murray Pond for ranges located in the Colonels Creek watershed and in Weston Lake for ranges within the Cedar Creek watershed. Down gradient groundwater receptors have also been identified in both watersheds, as shown in **Figure 3-6**.

Training Areas Containing Current Potential MCOC Sources

Eighteen training areas, which include 16 of the training areas with potential historical sources, contain current potential MCOC sources: artillery or mortar firing points, demolition areas, and/or suspected dudded areas.

Thirteen training areas, 11 of which contain potential historical MCOC sources, currently contain one or more artillery or mortar firing points. The locations of these firing points are shown in **Figure 3-5**. Three of the training areas containing firing points are located in the Cedar Creek watershed. The remainder of these training areas is located in the Colonels Creek watershed, primarily along the northeastern and southeastern boundaries of the installation. One of these training areas also contains a demolition area, and two of these training areas also contain suspected dudded areas.

Two training areas, both located in the Colonels Creek watershed, contain demolition areas. One demolition area is located in the west-central portion of the installation. According to the McCrady

Training Center GIS RFMSS Analyst, the other demolition area is temporary. It is located in the central portion of the installation, and RFMSS data indicate that use of this temporary demolition area began in 2007.

Six training areas contain suspected dudded areas identified by Fort Jackson range control, all of which are located in the Colonels Creek watershed. Four of these areas are delineated on the Fort Jackson Installation Field Map (Fort Jackson ITAM, 2006) and are shown in **Figure 3-5**. According to Fort Jackson range control, one of the suspected dudded areas along the eastern installation boundary is from a WWII mortar range. **Figures 3-1** and **3-2** confirm the presence of a mortar range in the 1940s that was situated north of the cantonment area and fired to the north-northwest. The dudded area located along the southern boundary of the training center was the impact area for a rifle grenade range in the 1940s based on a 1946 historical map (**Figure 3-1**). Based on interviews with Fort Jackson range control, a suspected dudded area associated with a WWII anti-tank range is located in the central portion of the installation. This area is not shown on the Fort Jackson Installation Field Map.

Historical and/or current MCOC sources may be present at the training areas discussed above. Surface water and surficial groundwater may transport MCOC from these training areas to receptors downstream or down gradient. Potential human surface water receptors have been identified for the Colonels Creek and Cedar Creek watersheds due to the recreational use of Murray Pond and Weston Lake. This pathway also has the potential to affect sensitive environments, such as wetlands. Down gradient groundwater receptors have also been identified in both watersheds, as shown in **Figure 3-6**. Although the majority of surficial groundwater in the Cedar Creek watershed is expected to discharge into Weston Lake, MCOC from these training areas also have the potential to reach private domestic wells south of Weston Lake. Additionally, topographic contours shown in **Figure 3-6** show that surficial groundwater in portions of the training area east of Weston Lake are approximately one-fourth mile up gradient from a domestic well.

4.0 Grouping and Categorization Methods

4.1 Grouping Rationale

The ARID-GEO (2006) data identifies operational ranges within the installation boundaries. The identified operational ranges may contain live- or non-live-fire ranges, firing points, or other training activities. For the purposes of the Phase I Assessment, operational range areas are divided into various groups. Groups are defined by the presence or absence of the three CSM components: source of MCOC, migration pathway, and receptor. The acronym designations for these components are presented below:

Source of MCOC

- **Limited Source (LS)**: Limited or no munitions have been used on-range. No migration pathway or receptor designation is needed for this group.
- **Munitions (M)**: Munitions have been used on-range. This designation is always followed by the applicable pathway designation.

Migration Pathway

- **Pathways Unlikely (PU)**: Migration pathways are unlikely or incomplete. This designation is always preceded by an M signifying that munitions have been used on-range.
- **Groundwater (GW)**: A groundwater migration pathway was identified. This designation is always preceded by an M signifying that munitions have been used on-range.
- **Surface Water (SW)**: A surface water migration pathway was identified. This designation is always preceded by an M signifying that munitions have been used on-range.

Receptor

- **Human (H)**: Source-receptor interaction is complete or potentially complete for human receptors. This designation is always preceded by both the M designation and the applicable pathway designation.
- **Ecological (E)**: Source-receptor interaction is complete or potentially complete for ecological receptors. This designation is always preceded by both the M designation and the applicable pathway designation.

The (H) and (E) designations follow the applicable pathway. For example, if a source has been identified, both surface water and groundwater pathways exist, the source-receptor interaction is complete for human and ecological receptors of surface water, and the source-receptor interaction is complete for human receptors of groundwater, then the group is MSW (H/E) GW (H).

4.2 Categorization Rationale

Each range group can be placed into one of three categories (Referred, Inconclusive, or Unlikely). Category definitions are presented in Section 1.2 and **Appendix A**.

Ranges in groups with at least one CSM component absent (source of MCOC, migration pathway, or receptor) are designated as Unlikely because a source-receptor interaction does not exist.

Ranges in groups with all three CSM components (source of MCOC, migration pathway, and receptor) are categorized based on review of available data using a weight of evidence approach. Examples for placing these range groups into the three categories are provided below:

- **Referred –** If one or more MCOC are present in off-range media (i.e., groundwater, sediment, surface water, or soil) at levels that present an unacceptable risk to human health or the environment as confirmed through acceptable sampling data, the group is categorized as Referred.
- **Inconclusive** – If one or more MCOC are or have the potential to be present in off-range media and source-receptor interactions are complete or potentially complete, but data are unavailable or insufficient to determine whether receptors are at risk or whether potential source-receptor interactions are complete, the group is categorized as Inconclusive.
- **Unlikely** – Ranges where, based upon a review of readily available information, there is sufficient evidence to show that there are no known releases or source-receptor interactions that could present an unacceptable risk to human health or the environment are categorized as Unlikely. In addition, if compelling data (sampling or weight of evidence rationale) indicate that source-receptor interactions are complete, but the levels do not pose unacceptable risk to human health or the environment, the group is categorized as Unlikely.

5.0 Conceptual Site Model Narrative

The operational ranges at McCrady Training Center have been placed into three groups: MSW (H/E) GW (H/E), MSW (H/E) GW, and LS. Rationale for placing ranges into these groups is discussed in the sections below and is based on the source of potential MCOC, exposure pathways, and potential receptors described earlier in this report. This information is used to determine if a potential source-receptor interaction exists for each relevant pathway identified, which is used to determine the appropriate categorization for each group.

Figure 5-1 depicts the range groupings, which are described below. The potential source-receptor interactions based on the CSM components described below are depicted in **Figure 5-2** for Group MSW (H/E) GW (H/E), **Figure 5-3** for Group MSW (H/E) GW, and **Figure 5-4** for Group LS. **Table 5-1** provides site-specific information concerning the CSM components for each group identified within McCrady Training Center, including potential sources, source media, release mechanisms, exposure media, exposure routes, and receptors.

5.1 Group MSW (H/E) GW (H/E)

5.1.1 Primary Source and MCOC

Sources of potential MCOC at Group MSW (H/E) GW (H/E) ranges include two firing ranges, one small arms range, and 43 training areas. Training areas have been included in Group MSW (H/E) GW (H/E) if their current or historical use presents a potential MCOC source. Eighteen of the 43 training areas contain artillery or mortar firing points, demolition areas, or suspected dudded areas, 16 of which also contain potential historical MCOC sources. The remaining 25 training areas also contain potential historical sources of MCOC, which include historical artillery impact areas or firing points. Surface danger zones for numerous historical ranges overlap all of these training areas. Military munitions currently used on Group MSW (H/E) GW (H/E) operational ranges include small to large caliber military munitions, rockets, high explosives (HE), pyrotechnics/obscurants, and demolition materials. MCOC associated with the ranges placed into the MSW (H/E) GW (H/E) group include metals MCOC (lead, antimony, copper, zinc, and tungsten), NG, TNT, RDX, HMX, 2,4-DNT, 2,6-DNT, PETN, and perchlorate. WP has not been included as an associated MCOC based on the sampling results discussed in Section 3.1.3, which indicate that the risk of WP contamination at McCrady Training Center is negligible (USACE, 1993).

5.1.2 Source Media

Primary source media identified at the ranges in Group MSW (H/E) GW (H/E) include soil, surface water, and sediment. MCOC can deposit in surface water and sediment by direct firing. High order detonations, which constitute most munitions detonations, generate undetectable to barely detectable and diffuse surface residuals. Because there is no direct contact of MCOC with groundwater, shallow groundwater is considered a secondary source where potential MCOC can leach/infiltrate into shallow groundwater from soil, sediment, and surface water. Surface water and sediment can also be secondary sources if they receive surface water runoff or erosion from soil source areas or surficial groundwater discharge.

5.1.3 Pathway Analysis

Migration mechanisms for potential MCOC in soil at the ranges in Group MSW (H/E) GW (H/E) include leaching or infiltrating through the soil profile to groundwater and surface erosion and subsequent runoff to sediment and surface water. MCOC in surface water are also subject to plant

and animal uptake and subsequent ingestion and/or dermal absorption by humans or off-range ecological receptors. At Fort Jackson, including the portion licensed to the SCARNG that constitutes McCrady Training Center, a shallow perched groundwater aquifer produces a high likelihood for surficial groundwater to discharge into down gradient surface water. As a result, MCOC have the potential to migrate from shallow groundwater to surface water. This groundwater pathway exists only for the surficial aquifer and not for the deep regional aquifer, the basal Middendorf Formation. Sampling data indicate that groundwater wells at Fort Jackson screened in the regional aquifer do not contain elevated levels of MCOC. It is assumed that this is due primarily to the clay layers between the two aquifers, which significantly decrease permeability. Well logs indicate that installation wells at Fort Jackson, including McCrady Training Center, are all over 100 feet deep, with static water levels ranging from 31 to 169 feet bgs. It is not likely that there is a potentially complete pathway for MCOC to the deeper regional aquifer at McCrady Training Center.

5.1.4 Potential Source-Human Interaction Pathway Analysis

Ranges within Group MSW (H/E) GW (H/E) lie within the Colonels Creek and Cedar Creek watersheds, which are delineated in **Figure 3-9**. Surface water source-human interaction pathways have been identified for each watershed. The two watersheds drain to one or more recreational areas that are located either off-installation or in nonoperational areas of Fort Jackson or McCrady Training Center. Surface water and sediment in these recreational areas are potential pathways for human receptors via dermal contact or accidental ingestion. Potential MCOC sources within the Colonels Creek watershed may impact off-installation recreational areas at Murray Pond, which is located less than one mile south of the McCrady Training Center cantonment area, and recreational areas at Varn Lake, which is located in the cantonment area. The Weston Lake recreation area, which is located in Fort Jackson's nonoperational area, is just downstream of the Cedar Creek watershed ranges and is used for fishing, camping, and other recreational activities. **Figure 3-10** displays down gradient surface water bodies within approximately 15 miles of McCrady Training Center. In addition, fish are known to bioaccumulate certain MCOC, including metals. No fish tissue studies were identified for areas in or around McCrady Training Center; however, such bioaccumulation from exposure either on-range or off-range is possible. Therefore, consumption of fish is a potential pathway to humans.

Surficial groundwater flow within these watersheds generally follows in the direction of surface water flow. The MCOC source areas in the Colonels Creek and Cedar Creek watersheds are up gradient of rural areas serviced by private groundwater wells, as shown in **Figure 3-6**. Private groundwater wells are located to the south, southwest, and southeast of the main portion of McCrady Training Center. These wells may be screened in the surficial aquifer and represent a potential pathway for human receptors via ingestion or dermal contact. McCrady Training Center obtains its potable water from drinking water supply wells that draw from the regional aquifer. As discussed above, these wells are unlikely to be impacted by MCOC.

5.1.5 Potential Source-Ecological Interaction Pathway Analysis

The migration of MCOC off-range from the sources identified at the ranges in Group MSW (H/E) GW (H/E) through surface water and groundwater pathways has the potential to affect sensitive off-range habitats (e.g., wetland habitats), as well as wetlands throughout the installation. Surficial groundwater potentially containing MCOC may also migrate off-range and discharge to surface water downstream.

5.2 Group MSW (H/E) GW

5.2.1 Primary Source and MCOC

Group MSW (H/E) consists of two small arms ranges. Military munitions currently used on Group MSW (H/E) GW operational ranges include small caliber military munitions and pyrotechnics/obscurants. MCOC associated with the ranges placed into the MSW (H/E) GW group include perchlorate, lead, antimony, copper, zinc, and tungsten.

5.2.2 Source Media

Primary source media identified at the ranges in Group MSW (H/E) GW include soil, surface water, and sediment. MCOC can deposit in surface water and sediment by direct firing. Because there is no direct contact of MCOC with groundwater, shallow groundwater is considered a secondary source, where potential MCOC can leach/infiltrate into shallow groundwater from soil, sediment, and surface water. Surface water and sediment can also be secondary sources if they receive surface water runoff or erosion from soil source areas or surficial groundwater discharge.

5.2.3 Pathway Analysis

Migration mechanisms for potential MCOC in soil at the ranges in Group MSW (H/E) GW include leaching or infiltrating through the soil profile to groundwater and surface erosion and subsequent runoff to sediment and surface water. MCOC in surface water are also subject to plant and animal uptake and subsequent ingestion and/or dermal absorption by humans or off-range ecological receptors.

At McCrady Training Center, a shallow perched groundwater aquifer produces a high likelihood for surficial groundwater to discharge into down gradient surface water. Surficial groundwater flow from Group MSW (H/E) GW ranges flows southwest, in the same direction as surface water flow in the Gills Creek watershed. It is anticipated that the majority of this water discharges directly into Gills Creek or into one of its tributaries prior to moving off-installation. Groundwater wells were not identified within four miles down gradient from the Group MSW (H/E) GW ranges. Therefore, a complete pathway is not identified for surficial groundwater. Likewise, a pathway has not been identified for regional groundwater flow at McCrady Training Center. Sampling data indicate that groundwater wells near the SCARNG small arms ranges that are screened in the regional aquifer do not contain elevated levels of MCOC (ATC, 2005). Therefore, it is not likely that there is a potentially complete pathway for MCOC to the deeper regional aquifer. It is assumed that this is due primarily to the presence of clay lenses between the two aquifers, which significantly retard contaminant migration. Additionally, regional groundwater flows to the southeast, and these ranges are located more than four miles up gradient from nonoperational area.

5.2.4 Potential Source-Human Interaction Pathway Analysis

Ranges within Group MSW (H/E) GW lie within the Gills Creek watershed, as shown in **Figure 5-1**. Surface water source-human interaction pathways have been identified for both ranges. Gills Creek drains to Forest Lake, which is used for recreational purposes. Surface water and sediment in this lake are potential pathways for human receptors via dermal contact or accidental ingestion. MCOC sources from the Gills Creek ranges could potentially impact off-installation recreational areas at Forest Lake and Lake Katherine, which are approximately five to 10 miles downstream from the two small arms ranges in Group MSW (H/E) GW. In addition, fish are known to bioaccumulate certain MCOC, including metals. No fish tissue studies were identified for areas in or around McCrady Training Center; however, such bioaccumulation from exposure either on-range or off-range is

possible. Therefore, consumption of fish is a potential pathway to humans.

5.2.5 Potential Source-Ecological Interaction Pathway Analysis

The migration of potential MCOC off-range from the sources identified at the ranges in Group MSW (H/E) GW through surface water pathways has the potential to affect sensitive off-range habitats (e.g., wetland habitats), as well as wetlands throughout the installation.

5.3 Group LS

5.3.1 Primary Source and MCOC

Group LS consists of 14 training areas currently used for training and maneuvering. Currently, no munitions are used in these areas. Limited historical munitions usage, if any, has occurred. Historical munitions use was limited primarily to the presence of one or more safety fans for small arms ranges. No or limited potential MCOC sources were identified for these 14 ranges.

5.3.2 Source Media

No or limited potential MCOC sources were identified for the operational ranges in Group LS; therefore, source media were not identified.

5.3.3 Pathway Analysis

No or limited potential MCOC sources were identified for the operational ranges in Group LS; therefore, potential pathways were not evaluated.

5.3.4 Potential Source-Human Interaction Pathway Analysis

No or limited potential MCOC sources were identified for the operational ranges in Group LS; therefore, potential source-human receptor interactions were not evaluated.

5.3.5 Potential Source-Ecological Interaction Pathway Analysis

No or limited potential MCOC sources were identified for the operational ranges in Group LS; therefore, potential source-ecological receptor interactions were not evaluated.

5.4 Data Uncertainties

ARID-GEO (2006)

One of the ranges included in the McCrady Training Center inventory, issued in October 2006, was also included in the Fort Jackson inventory, issued in March 2006. This training area is located west of Weston Lake and is depicted in **Figure 5-5**. The ARID-GEO (2006) data for McCrady Training Center were not altered based on this data uncertainty, as the McCrady ARID-GEO data are more recent than the Fort Jackson ARID-GEO data. The boundary of Fort Jackson has been altered on the figures included in this document so that it does not encompass this training area.

RFMSS

According to ARID-GEO (2006), the large firing range at McCrady Training Center has the same name as a smaller firing range at Fort Jackson. These firing ranges are both located northwest of Weston Lake, but are in slightly different locations. RFMSS data for the SCARNG firing range are recorded by McCrady Training Center, as well as by Fort Jackson. According to the McCrady Training Center RFMSS GIS Analyst, prior to 2006, RFMSS data for the SCARNG ranges were

recorded solely by Fort Jackson. Therefore, RFMSS entries for this range from 2004 to 2006 may apply to either the smaller Fort Jackson range or the larger range licensed to the SCARNG. Some of the DoD Identification Codes included in the Fort Jackson 2006 RFMSS data were not included in the SCARNG 2006 RFMSS data for this range, indicating that the munitions use reported in RFMSS may be split between the two ranges. Therefore, 2004 and 2005 munitions data for this range have not been included in this assessment.

Impact of Data Uncertainties

The data uncertainties presented above are included to point out inconsistencies or deficiencies with ARID-GEO and RFMSS data. Due to these data uncertainties, the quantity of munitions reported for the larger SCARNG firing range may be slightly lower than it should be. These data uncertainties are not expected to affect the overall conclusions of this report.

Table 5-1: Summary of the Conceptual Site Model Components

Group Identification	Primary Source	Primary MCOC	Source Media	Release Mechanism	Exposure Media	Exposure Routes	Receptors
Group MSW (H/E) GW (H/E)	Firing points, small arms firing, demolition areas, suspected dudded areas, and historical artillery impact areas or firing points	TNT, PETN, 2,4,-DNT, 2,6-DNT, RDX, HMX, NG, perchlorate, lead, antimony, copper, zinc, and tungsten	Soil, surface water, and sediment	Leaching, infiltration, erosion/runoff, plant and animal uptake, and recharge/discharge of groundwater and surface water	Surface water / sediment, food chain, and groundwater	Ingestion and dermal absorption	Local and off-range residents; residents down gradient; recreational users of water bodies and threatened and endangered species downstream
Group MSW (H/E) GW	Small arms firing	Perchlorate, lead, antimony, copper, zinc, and tungsten			Surface water / sediment and food chain		Recreational users of water bodies and threatened and endangered species downstream
Group LS	Limited source – limited or no historical military munitions use	Not evaluated (limited source was identified)

6.0 Summary of Findings and Conclusions

The operational ranges at McCrady Training Center have been categorized as a result of the Phase I Assessment as described below. **Figure 6-1** illustrates the conclusions of this Phase I Assessment. The findings and conclusions for these operational ranges are presented in **Table 6-1.** Conclusions are based on readily available information collected to date.

6.1 Summary of Findings

The 62 ranges at McCrady Training Center consist of firing ranges, small arms ranges, and training areas totaling 14,895 acres[3]. According to munitions data collected during the Phase I Assessment, the types of munitions fired include small, medium, and large caliber munitions, rockets, HE, pyrotechnics/obscurants, and demolition materials. Potential MCOC associated with these munitions types include TNT, HMX, RDX, 2,4-DNT, 2,6-DNT, PETN, perchlorate, NG, lead, antimony, copper, zinc, and tungsten.

Based on data collected during the Phase I Assessment regarding current and historical MCOC sources, potential migration pathways from ranges, and potential off-range human and/or ecological receptors, the operational ranges at McCrady Training Center have been placed into the following range groupings:

Group MSW (H/E) GW (H/E)
The 46 ranges identified in Group MSW (H/E) GW (H/E) have current and/or historical sources of potential MCOC that were identified during the Phase I Assessment. These sources have the potential to migrate off-range via surface water and groundwater pathways. The source-receptor interaction was identified as complete or potentially complete for human and ecological receptors for both the surface water pathway and surficial groundwater pathway.

Group MSW (H/E) GW
The two ranges identified in Group MSW (H/E) GW are currently utilized as small arms ranges and contain current sources of MCOC that were identified during the Phase I Assessment. These sources have the potential to migrate off-range via surface water and groundwater pathways. The source-receptor interaction was identified as complete or potentially complete for human and ecological surface water receptors.

Group LS
The 14 ranges identified in Group LS have only limited or no current and/or historical sources of potential MCOC that were identified during the Phase I Assessment.

6.2 Conclusions

Each of the operational range groups described above is placed into one of three possible categories: Referred, Inconclusive, or Unlikely. Conclusions for each category are discussed below.

Referred – Refer to Appropriate Cleanup Program
Based on data reviewed during the Phase I Assessment, no operational ranges at McCrady Training

[3] The total operational range area was derived from the Operational Use Area (total range area) acreage as reported in ARID-GEO (2006).

Center are categorized as Referred.

Inconclusive – Phase II Quantitative Assessment Required

Operational ranges where a source of potential MCOC source, an exposure pathway, and receptors have been identified are categorized as Inconclusive and comprise Groups MSW (H/E) GW (H/E) and MSW (H/E) GW. Based on current and historical military munitions usage at McCrady Training Center and a review of potential migration pathways and potential human and/or ecological receptors, a total of 48 ranges, covering 12,243 acres[4], were identified as having the potential for MCOC to migrate off-range and affect human and/or ecological receptors. At the completion of the Phase I Assessment process, installations with ranges in the Inconclusive category will be prioritized for further analysis during Phase II Quantitative Assessments.

Unlikely – Five-Year Review

Ranges determined to have at least one CSM component (i.e., source of potential MCOC, pathway, or receptor) absent or sampling data indicating that a source-receptor interaction is not present are categorized as Unlikely and comprise Group LS. Based on current and historical military munitions usage at McCrady Training Center and a review of potential migration pathways and potential human and/or ecological receptors, a total of 14 ranges, covering 2,652 acres[5], were identified as being unlikely to have potential MCOC migrate off-range and affect human or ecological receptors. Ranges categorized as Unlikely will be required to undergo a periodic re-evaluation to determine if conditions affecting this assessment (e.g., range operations, site conditions, applicable regulations) have changed since the original categorization was finalized (DoD, 2005). This re-evaluation will occur at least every five years.

[4] The total acreage for the Inconclusive category was derived by (1) merging individual ranges in the Inconclusive category to eliminate overlap and (2) calculating the total acreage of the merged ranges. Therefore, the Inconclusive category acreage is an estimated value that does not account for overlapping range acreage.

[5] Due to overlapping range boundaries depicted in the ARID-GEO (2006), the total acreage for the Unlikely category was derived by subtracting the Inconclusive category acreage from the Operational Use Area (total range area) acreage as reported in ARID-GEO (2006). Therefore, the Unlikely category acreage is an estimated value.

Table 6-1: Summary of Findings and Conclusions for McCrady Training Center

Category	Total Number of Ranges and Acreage	Group Identification	Source(s)	Pathway(s)	Human Receptors	Ecological Receptors	Conclusions and Rationale
Inconclusive	46 operational ranges; 12,199 acres	MSW (H/E) GW (H/E)	Firing points, small arms firing, demolition areas, suspected dudded areas, and historical artillery impact areas or firing points	Colonels Creek, Varn Lake, and Murray Pond (to the south and southeast); Weston Lake and Cedar Creek (to the southeast and southwest); surficial groundwater aquifer (to the south, southeast, and southwest)	Residents down gradient, local and off-range residents, and recreational users of Murray Pond and Weston Lake downstream	Wetlands and threatened and endangered species downstream	Phase II Quantitative Assessment is required. Residents and recreational users are present down gradient and downstream.
	2 operational ranges; 44 acres	MSW (H/E) GW	Small arms firing	Gills Creek and Forest Lake (to the west and southwest)	Recreational users of Forest Lake and Lake Katherine downstream	Wetlands and threatened and endangered species downstream	Phase II Quantitative Assessment is required. Residents and recreational users are present downstream.
Unlikely	14 operational ranges; 2,652 acres	LS	Limited source – limited or no historical military munitions use	Not evaluated (limited source identified)			Re-evaluate during the five-year review. A limited source was identified.

Appendix A: Glossary of Terms

GLOSSARY OF TERMS

The terms outlined below are those that will be used commonly during the Phase I Assessment process. The relevant reference for each is presented at the end of the definition. If no reference is presented, then the term is not an official Department of Defense (DoD) definition and applies only to the U.S. Army's Operational Range Assessment Program.

Dudded Impact Area – An area having designated boundaries within which all dud-producing ordnance will detonate or impact. Vehicle bodies are sometimes placed in the area to act as targets for direct and indirect artillery fire. The primary function of the impact area is to contain weapons effects as much as possible using earthen berms or natural terrain features. Impact areas containing unexploded ordnance may not be used for maneuver. Each area, typically managed and scheduled by either numeric, lettered, or alphanumeric code through the installation training or range control manager (e.g., Directorate of Plans, Training, Mobilization and Security [DPTMS], DPTMS-equivalent), should be accounted for with a separate facility number and real property record.[1]

Group – A group is a collection of one or more ranges within an operational range area (range complex area) that shares similar characteristics. Similar characteristics can include types of activities, munitions usage, geographic proximity, surface water or groundwater divides, or even common receptors.[2]

Inconclusive – Phase II Quantitative Assessment Required – Ranges where existing information either is insufficient to make a source-receptor interaction determination or indicates the potential for such interaction to be occurring.[3]

Large Caliber – Munitions include projectiles greater than 60 millimeters (mm) (including 75-mm, 76-mm, 81-mm, 90-mm, 105-mm, 155-mm, 14-inch and 16-inch projectiles).[4]

Medium Caliber – Munitions include projectiles sized from 20-mm to 60-mm (including 20-mm, 25-mm, 30-mm, 37-mm, 40-mm and 60-mm projectiles).[5]

Military Munitions – All ammunition products and components produced or used by the armed forces for national defense and security, including ammunition products or components under the control of the DoD, the United States (U.S.) Coast Guard, the U.S. Department of Energy (DOE), and the Army National Guard. The term military munitions includes: confined gaseous, liquid, and solid propellants; explosives; pyrotechnics; chemical and riot control agents; smoke and incendiaries, including bulk explosives and chemical warfare agents; chemical munitions; rockets; guided and ballistic missiles; bombs; warheads; mortar rounds; artillery ammunition; small arms ammunition; grenades; mines; torpedoes; depth charges; cluster munitions and dispensers; demolition charges; and devices and components thereof. Military munitions do not include wholly inert items; improvised explosive devices; and nuclear weapons, nuclear devices, and nuclear components, other than

[1] DA, 2000
[2] This definition was based on guidance from the USACHPPM (2005), as well as further input/guidance from the U.S. Army Environmental Command and the U.S. Army Center for Health Promotion and Preventive Medicine.
[3] See note 2.
[4] See note 2.
[5] See note 2.

nonnuclear components of nuclear devices that are managed under the nuclear weapons program of the DOE after all required sanitization operations under the Atomic Energy Act of 1954 (42 United States Code [U.S.C.] 2011 et seq.) have been completed. (10 U.S.C. 101(e)(4)(A) through (C))

Munitions Constituents (MC) – Any materials that originate from unexploded ordnance, discarded military munitions, or other military munitions, including explosive and nonexplosive materials, and emission, degradation, or breakdown elements of such ordnance or munitions. (10 U.S.C. 2710(e)(3))

Munitions Constituents of Concern (MCOC) – Those MC that have the potential to migrate from a source area to a receptor (human or ecological) in sufficient quantity to cause an unacceptable risk to human health or the environment. (DoD, 2005) MCOC for high explosives include: trinitrotoluene (TNT); cyclotetramethylenetetranitramine (HMX); pentaerythritoltetranitrate (PETN); cyclotrimethylenetrinitramine (RDX); 2,4-dinitrotoluene (DNT); and 2,6-DNT. MCOC for small arms include lead, antimony, copper, zinc, and tungsten. MCOC for training areas include perchlorate (a propellant) and white phosphorus (an incendiary agent). Additional MCOC may be addressed on an installation-specific basis.[6]

Non-Dudded Impact Area – An area having designated boundaries within which ordnance that does not produce duds will impact. This area is composed mostly of the safety fans for small arms ranges. The primary function of the impact area is to contain weapons effects as much as possible using earthen berms or natural terrain features. Each area, typically managed and scheduled by either numeric, lettered, or alphanumeric code through the installation training or range control manager (e.g., DPTMS, DPTMS-equivalent), should be accounted for with a separate facility number and real property record. These impact areas may be used for maneuver, at the cost of curtailing the use of weapons ranges.[7]

Off-Range Area – For the purpose of the Phase I Assessment, off-range areas include those areas outside of the boundaries of the operational range area as established by the Army Range Inventory Database-Geodatabase. Off-range areas may include both on- (e.g., cantonment areas) and off-installation locations.

Operational Range – A range that is under the jurisdiction, custody, or control of the Secretary of Defense and that is used for range activities or, although not currently being used for range activities, that is still considered by the Secretary to be a range and has not been put to a new use that is incompatible with range activities. (10 U.S.C. 101(e)(3))

Other Munitions – Munitions from aerial fire (rockets and large bombs), hand grenades, light anti-tank weapons, and anti-armor missiles.[8]

Pathway – The environmental medium through which an MCOC is transported from the source to the receptor. (DoD, 2005)

[6] See note 2.
[7] See note 1.
[8] See note 2.

Range – The term range, when used in the geographical sense, means a designated land or water area that is set aside, managed and used for range activities of the DoD. The term includes: (A) firing lines and positions, maneuver areas, firing lanes, test pads, detonation pads, impact areas, electronic scoring sites, buffer zones with restricted access, and exclusionary areas and (B) airspace areas designated for military use in accordance with regulations and procedures proscribed by the Administrator of the Federal Aviation Administration. (10 U.S.C. 101(e)(1)(A) and (B))

Range Complex – For the purpose of the Phase I Assessment, range complexes are contiguous operational ranges that may be grouped together and assessed as a single range (also referred to as an operational range area).

Receptor – A human, animal, or plant species that is exposed, or that may be exposed, to MC. (DoD, 2005)

Referred – Ranges with compelling evidence (e.g., sampling data) to indicate the presence of an off-range release that potentially poses an unacceptable risk to human health or the environment.[9]

Sensitive Environments – Terrestrial or aquatic resources, fragile natural settings, or other areas with unique or highly valued environmental features.[10]

Small Arms – Small arms include all shotgun, .22-, .223-, .30-, .32-, .38-, .45-, and .50-caliber, 5.56-mm, 7.62-mm, 9-mm and 10-mm weapons.[11]

Small Caliber – Munitions used in small arms and fired from weapons with muzzle diameter of up to .50-caliber or one-half inch.[12]

Source – An area where MC may have been deposited, disposed, or placed. (DoD, 2005)

Training Area – For the purpose of the Phase I Assessment, training areas refer to the ranges that have non-live-fire troop activities. These areas can have a variety of activities that include bivouac, troop movement, and tactics.

Unknown Munitions – Items that have not been identified or positively identified.[13]

Unlikely – Five-Year Review – Ranges where, based upon a review of readily available information, there is sufficient evidence to show that there are no known releases or source-receptor interactions that could present an unacceptable risk to human health or the environment.[14]

South Carolina Army National Guard. 2006. *Training Ammunition Usage by Facilities Report 01 April 2005 to 30 September 2006.*

------. 2007. RFMSS Data FY 2004 to FY 2007 (1 January 2004 through 18 May 2007).

B5 – Personnel Interviews

Fort Jackson DPTMS Range Officer
Date of interview: 10 October 2006 by Malcolm Pirnie, Inc.
No documents relevant to McCrady Training Center obtained.

Fort Jackson DPTMS Training Facility Coordinator
Date of interview: 27 November 2006 by Malcolm Pirnie, Inc.
Provided locations of several firing points at Fort Jackson and McCrady Training Center.

Fort Jackson ENRD GIS Specialist
Dates of interviews: 11 October 2006 and 4 December 2006 by Malcolm Pirnie, Inc.
Provided GIS layers listed in Appendix B4.

McCrady Training Center Environmental/Conservation Manager
Dates of interviews: 11 October 2006 and 23 May 2007 by Malcolm Pirnie, Inc.
Provided numerous environmental documents listed in Appendix B4.

McCrady Training Center Environmental/Intern
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
No documents obtained.

McCrady Training Center Environmental/Natural Resources Coordinator
Date of interview: 23 May 2007 by Malcolm Pirnie, Inc.
Provided numerous environmental documents and GIS layers listed in Appendix B4.

McCrady Training Center Environmental/Natural Resources Coordinator (former)
Date of interview: 11 October 2006 by Malcolm Pirnie, Inc.
Provided INRMP and Erosion Control Study listed in Appendix B4.

McCrady Training Center Facilities Engineer
Dates of interviews: 11 October 2006 and 24 May 2007 by Malcolm Pirnie, Inc.
Provided groundwater supply well data listed in Appendix B4.

McCrady Training Center Facilities Management Specialist
Date of interview: 23 May 2007 by Malcolm Pirnie, Inc.
No documents obtained.

McCrady Training Center Plans, Operations, and Training Officer/ITAM Coordinator
Dates of interviews: 11 October 2006 and 23 May 2007 by Malcolm Pirnie, Inc.
Provided RFMSS data listed in Appendix B4.

McCrady Training Center Range Operations, Soldier Readiness Program Manager
Date of interview: 23 May 2007 by Malcolm Pirnie, Inc.
No documents obtained.

Mississippi State Professor
Date of interview: 25 January 2007 by Malcolm Pirnie, Inc.
Provided information on small arms ranges study, specifically the lead detection limit used.

Subject: Final Report Operational Range Phase II Assessment,
U.S. Army Garrison Fort Jackson and McCrady Training Center, South Carolina

Dear Mr. Estaba and Mr. Mohr:

The PIKA-Pirnie JV is pleased to provide this *Final Report Operational Range Phase Assessmentt, U.S. Army Garrison Fort Jackson and McCrady Training Center, South Carolina* for your review. In addition to the report, the Response to Comments document for the Draft Version of the report and various trip reports for field activities completed are also included. Enclosed are one hard copy of the report and two electronic copies (CDs).

In conformance with our program procedures, this report has also been submitted to the following organizations:

- Assistant Chief of Staff for Installation Management – Installation Services Environmental Division (ACSIM-ISE);
- U.S. Army Environmental Command (USAEC)
- Army National Guard (ARNG) Directorate
- U.S. Army Corps of Engineers (USACE) – Baltimore District
- U.S. Army Institute of Public Health (USAIPH)

If you have any questions, please do not hesitate to contact Mr. Joseph Brutsman, USAEC, at 210-466-1688 or me at 813-242-7215.

Sincerely,

Susan Burtnett, P.E., BCEE
Project Manager
PIKA-Pirnie JV, LLC

c: USACE Program Manager (Andrea Graham) – hard copy and CDs (2)
c: USAEC Program Manager (Joseph Brutsman) – hard copy and CDs (2)
c: ARNG Program Manager (Bonnie Packer) – hard copy and CD
c: USAEC Project Manager (Jeff Davis) – letter only
c: USACHPPM Program Manager (Barrett Borry) – CD only
c: ACSIM-ISE (Malcolm Garg) – CD only

Final Report
Operational Range Phase II Assessment
United States Army Garrison Fort Jackson and McCrady Training Center, South Carolina

Executive Summary

To meet Department of Defense (DoD) requirements and support the United States (U.S.) Army's Sustainable Range Program, U.S. Army Environmental Command (USAEC) and the Army National Guard (ARNG) Directorate are conducting assessments to determine whether a release or substantial threat of release of munitions constituents of concern (MCOC) from an operational range to an off-range area creates a potentially unacceptable risk to human health or the environment. The initial Operational Range Assessment Program (ORAP), Phase I, was a qualitative study of whether MCOC sources exist on the operational range footprint, potential migration mechanisms exist, and human or sensitive ecological receptors are present. For the operational range footprints having a potentially complete source-receptor pathway, the Army conducts a Phase II, a quantitative assessment of potentially complete pathways of MCOC to other than operational areas. This ORAP Phase II Report presents evaluation of source-receptor pathways on the combined footprint of Fort Jackson and McCrady Training Center, South Carolina. Combining the Phase II assessments for these two installations was a decision agreed upon by both the USAEC and the ARNG Directorate as a more efficient method to assess the potential source-receptor interactions for two installations immediately adjacent to one another. Thus, this Phase II Report presents the evaluation of source-receptor interaction at both Fort Jackson and McCrady Training Center. Activities completed as part of this Phase II were performed by Malcolm Pirnie, Inc. (now ARCADIS U.S., Inc.) under contract numbers W912DR-05-D-004 and W912DR-09-D-0016 with the U.S. Army Corps of Engineers – Baltimore District, and by the PIKA-Pirnie Joint Venture, LLC under contract number W912DY-10-D0025 with the U.S. Army Engineering and Support Center, Huntsville.

To determine whether MCOC were leaving the operational range by an identified pathway (e.g., groundwater, surface water) and posed a potential risk to off-site receptors, the ORAP team re-evaluated existing information (*e.g.*, prior sampling reports) and collected media samples. All available information was used to update the conceptual site model (CSM) and perform screening-level risk assessments to determine whether there has likely been an MCOC release from the operational range that may pose an unacceptable risk to an off-range receptor.

Fort Jackson and McCrady Training Center are adjoining installations, together occupying approximately 51,961 acres in Richland County, South Carolina (**Figure ES-1**). The South Carolina Army National Guard (SCARNG) holds a nonexclusive license for training operations on approximately 15,267 acres of the eastern portion of Fort Jackson. These 15,267 acres comprise the McCrady Training Center. Fort Jackson (as well as the portion now leased by SCARNG) has served as a military training facility since 1917. During World War II, Fort Jackson became a permanent military installation used primarily for infantry training.

Phase II multi-season sampling occurred between 2009 and 2013. **Figure ES-2** shows important features of the surface water system and a generalized CSM for surface water at the installation. The surface water CSM identifies potential sources of MCOC, watersheds and the specific surface water pathways by which these constituents could migrate (*i.e.*, streams) off the operational range footprint, and off-range human and ecological receptors that may be affected by migrating MCOC. The figure also shows the locations at which samples were collected as part of this assessment. **Figures ES-3** shows important features of the groundwater system at

Fort Jackson and McCrady Training Center and a generalized CSM. The groundwater CSM identifies potential sources of MCOC, inferred and actual groundwater flow directions, areas where potential human receptors utilize groundwater, and locations at which samples were collected as part of this assessment. The ORA team selected sampling locations to answer the study question: could munitions constituents migrate off the operational range footprint at concentrations that may pose a risk to receptors?

The following executive summary sections present the Phase II evaluation of source-receptor interactions.

1 Conceptual Site Model

1.1 Potential Sources

Operational ranges at Fort Jackson consist of training and maneuver areas, live-fire ranges, dudded and non-dudded impact areas, artillery and mortar firing points, and specialty training areas. Operational ranges at McCrady Training Center include: training and maneuver areas, firing points, and live-fire areas. The types of munitions historically and currently fired at Fort Jackson and McCrady Training Center are small caliber, medium caliber, large caliber, pyrotechnics/obscurants, and other munitions. Munitions constituents for this assessment are:

- Metals (primarily from small arms): antimony (Sb), copper (Cu), lead (Pb), tungsten (W) zinc (Zn), and uranium (U)
- Explosives, among which is cyclotrimethylenetrinitramine (RDX)
- Propellants (nitroglycerin [NG] and perchlorate)

1.2 Migration Pathways and Assessment Areas

MCOC (metals, propellants, and explosives) from the range footprint area may migrate via dissolved and particulate runoff into streams, and/or by infiltrating into groundwater. Groundwater may enter streams through seeps or springs either on- or off-installation.

Three major surface water drainage basins are present at Fort Jackson and McCrady Training Center: (1) Colonels Creek (including Jumping Run Creek), (2) Cedar Creek (which includes Weston Lake, and (3) Gills Creek (**Figure ES-2**). These three watersheds drain the overwhelming majority of the installations and operational ranges. Phase II sampling was conducted in each these three basins. Two other smaller surface water basins occur on installation (Mill Creek and Wildcat Creek) but do not drain a significant portion of the operational range area.

Groundwater at Fort Jackson and McCrady Training Center occurs within unconsolidated sediments and the underlying bedrock. Previously completed investigations in the region and data collected as part of this assessment confirm that shallow groundwater generally discharges to nearby streams (including those on installation such as Gills Creek, Cedar Creek, Colonels Creek, and Jumping Run Creek) while deeper groundwater flows to the south and southeast

towards the Congaree and Wateree rivers. Groundwater occurring within bedrock is not generally utilized in the areas downgradient of the installation. The CSM illustrates groundwater flow and where Phase II groundwater sampling was conducted (**Figure ES-3**).

1.3 Potential Receptors

The City of Columbia supplies drinking water to the population to the northwest and west of the installation from a source well outside of the influence of range activities. This supply network also extends to the south end of the installation and covers the area from Fort Jackson's southwest corner to near Weston Lake. Properties located south of the installation and east of Weston Lake use groundwater for drinking water. A review of available well databases showed hundreds of wells located in the area. MCOC migrating in groundwater may affect human receptors south of the installation where groundwater is used as a drinking water source.

The surface water system provides migration pathways and contact opportunities between potential MCOC sources and off-range human and ecological receptors. For each of the watersheds, potential downstream human receptors include the recreational users of the surface water bodies leaving the installations. For Cedar Creek and Gills Creek in particular, the Fort Jackson Family and Morale, Welfare and Recreation division maintain recreational facilities on Weston Lake and Boyden Arbor Pond, respectively, to provide access for use by the public. Recreational activities include fishing. Potential ecological receptors in surface water bodies leaving the installations include the sensitive wetland habitats downstream of operational areas and threatened and endangered species which may use surface water during part of their life-cycle. This assessment uses wetland areas as surrogates for sensitive species.

2 Sampling Program

2.1 Sampling Program Summary

2.1.1 Surface Water System Assessment

Table ES-1 summarizes the watersheds/assessment areas, sampling media, types of MCOC, and the rationale for sample locations.

Gills Creek Watershed: The ORA team collected surface water samples at a downstream location (GC2) and analyzed samples for metals, propellants, and explosives to assess potential impacts to human and ecological receptors in the area. Sediment samples were also collected at this location and analyzed for metals and explosives. Samples of surface water and sediment were also collected from an upstream location (GC1), and were used to represent reference or background concentrations. Samples of the benthic macroinvertebrate community were not collected in the Gills Creek watershed due to a lack of a suitable sampling area at the downstream location.

Cedar Creek Watershed: Cedar Creek originates within the operational range footprint of the combined installation, so there is no upstream/reference sampling location available within the watershed. Upstream sampling locations in Colonels Creek (CC1 and CC2) were utilized to

represent reference or background concentrations in the Cedar Creek watershed. Cedar Creek flows into Weston Lake which is dammed near the installation boundary. The lake discharges through an outflow at the installation boundary, where Cedar Creek resumes. In order to assess the Cedar Creek watershed the ORA team collected samples from two downstream locations in Weston Lake (WL1 and WL2) (**Figure ES-2**). Surface water samples collected from Weston Lake were analyzed for metals MCOC (Pb, Cu, Zn, and Sb), propellants, and explosives. Sediment samples collected from Weston Lake were analyzed for metals (Pb, Cu, Zn, and Sb) and explosives. Samples of the benthic macroinvertebrate community were not collected due to a lack of suitable sampling locations.

Colonels Creek Watershed: The ORA team collected surface water samples at a downstream location on Colonels Creek (CC3) and a downstream location in Jumping Run Creek (JC1), and analyzed samples for metals, propellants, and explosives. Sediment samples were also collected at these locations and analyzed for metals and explosives. Samples of surface water and sediment were collected from two upstream locations on Colonels Creek (CC1 and CC2) and were used to represent reference or background concentrations. Samples of the benthic macroinvertebrate community were also collected from all four sampling locations within the Colonels Creek watershed to assess the health of the aquatic community.

Table ES-1: Surface Water System MCOC Sampling Summary

Location	Sampled Media	Applicable MCOC	Receptors	Purpose
Gills Creek Watershed				
GC2	Surface Water Sediment	Metals Explosives Propellants[1]	Human and ecological	Downstream location within the operational range boundary draining a primarily non-dudded impact area and many of the small arms ranges within the Gills Creek watershed.
GC1			NA	Reference location upstream of potential source areas in the Gills Creek watershed.
Cedar Creek Watershed				
WL1	Surface Water Sediment	Metals Explosives Propellants[1]	Human and ecological	Downstream of firing ranges and dudded impact area. Also within the footprint of an area under investigation as part of the Military Munitions Response Program (MMRP).

Location	Sampled Media	Applicable MCOC	Receptors	Purpose
WL2				Downstream of firing ranges and dudded impact area within the Cedar Creek watershed. Location was shifted approximately 250 feet to the west for the dry season events, because the original locations were not accessible due to lower lake levels. Located within the footprint of an MMRP investigation area.
Colonels Creek Watershed				
CC1	Surface Water Sediment	Metals Explosives Propellants[1]	NA	Reference location upstream of potential source areas within the Colonels Creek watershed. Also used to provide reference information for the Cedar Creek watershed.
CC2				Reference location upstream of potential source areas in the McCrady Training Center in the Colonels Creek watershed. Also used to provide reference information for the Cedar Creek watershed.
CC3			Human and ecological	Downstream location within the operational range boundary draining more than half of the combined operational range area in the Colonels Creek Watershed.
JC1				Downstream location within the operational range boundary draining live-fire ranges and current and historical impact area within the Colonels Creek watershed. Jumping Run Creek also receives groundwater discharge that originates within the impact area.

Notes:
[1] – Sediment samples were analyzed for NG but not perchlorate.
NA – not applicable

2.1.2 Groundwater System Assessment

The groundwater system was assessed through the identification and evaluation of a worst-case scenario. The groundwater assessment area shown on **Figure ES-3** represents one of the most heavily-utilized impact areas within the combined installation footprint. Groundwater system

investigation activities performed in 2009, 2012, and 2013 included installation of piezometers to evaluate groundwater flow, drilling of soil borings and collection of depth-discrete groundwater samples, sampling of existing groundwater wells, and installation and sampling of new groundwater monitoring wells within the installation footprint.

Piezometers were installed in 2009 to collect water level data and to assist in the selection of drilling locations for soil borings for depth-discrete groundwater sampling. These borings were installed and 29 groundwater samples were collected at approximately 20-foot intervals from the water table down to a pre-determined depth at five locations (SB-2 through SB-6) based on the depths at which off-installation receptor wells are screened. On-installation wells were also sampled during 2009. Laboratory analyses of these samples included metals, explosives, and propellants. Metals and propellants were not detected in concentrations exceeding project action limits (PALs) during the 2009 sampling activities. However, the explosive RDX was detected in one of the wells, leading to additional groundwater investigation activities in 2012 and 2013. Six monitoring well pairs (each consisting of a shallow and deep well) were installed downgradient of the potential source area and the previous RDX detection location and upgradient of off-installation residential drinking water wells.

Three independent groundwater sampling events were completed between July 2012 and February 2013, using Hydrasleeves™ to collect representative groundwater samples from each of the newly installed monitoring wells. Before sampling began, guidance received from the Army indicated that munitions containing depleted U had been used at Fort Jackson. Therefore, laboratory analyses of groundwater samples collected from July 2012 to February 2013 included explosives, which were the remaining MCOC following evaluation of the 2009 groundwater sampling results, and U and U-isotopes. A summary of the groundwater sampling program is provided in **Table ES-2**.

Table ES-2: Groundwater Sampling Summary

Location	Sampled Media/ Frequency	Applicable MCOC	Receptors	Purpose
2009 Activities				
SB-2 SB-3 SB-4 SB-5 SB-6	Groundwater/ Once	Metals Explosives Propellants	Human and Ecological	Downgradient of main impact area. Depth-discrete groundwater samples were collected starting at the water table and then at approximately 20 foot intervals to a target elevation of 175 feet above mean sea level.
P1 P2			Ecological	Downgradient of main impact area. Groundwater samples were collected from piezometers to assess potential MCOC concentrations in groundwater adjacent to surface water bodies.

Location	Sampled Media/ Frequency	Applicable MCOC	Receptors	Purpose
Weston Lake Supply Well (WL1)			Human and ecological	Downgradient of main impact area. Groundwater sample was collected to assess potential MCOC concentrations in groundwater utilized as a drinking water source at the Weston Lake recreation area.

Notes:

D – Deep Well
MW – Monitoring Well
P - Piezometer
RS – Installed using Rotosonic® Drilling
S – Shallow Well
SB – Soil Boring
U - Uranium
WL – Weston Lake

2.2 Sampling and Analytical Methods

Streams: The ORA team conducted Phase II sampling during both wet and dry seasons, including one storm event. Surface water samples were collected using the 'clean-hands' method (U.S. Environmental Protection Agency [USEPA] Method 1638) as 24-hour or 2-hour composites whenever conditions allowed; grab samples were used when composite samples were unavailable due to safety issues or when automated composite samplers malfunctioned. During a dry season event, the team collected composite sediment samples in triplicate from the same depositional areas as the surface water sampling locations. The benthic macroinvertebrate community was sampled at four of the surface water system sampling locations (CC1, CC2, CC3, and JC1) in the Colonels Creek watershed during the wet and dry season.

Groundwater: In 2009, piezometers (P1 and P2) were installed and sampled using standard low-flow sampling procedures with a peristaltic pump. The supply well at Weston Lake (WL1 on **Figure ES-3**) was sampled from a pre-treatment outlet at the well head. Procedures utilized for

the collection of samples from temporary wells included: drilling to the anticipated sample depth using Rotosonic® technology, choosing a sampling interval based upon review of the retrieved sample core, advancement of a three-foot long pre-cleaned stainless steel well screen attached to a packer to the appropriate depth, sealing off a discrete interval within the aquifer, utilizing a submersible pump to purge water until water quality readings stabilized, and collection of the groundwater sample. The interval over which the aquifer was sampled was chosen based upon the depths of off-installation residential and supply wells.

Well clusters installed in 2012 were constructed as standard 2-inch inside diameter monitoring wells with shallow and deeper wells installed side-by-side in a 10-inch diameter soil boring. The screen depths were chosen to intercept groundwater from similar intervals in which RDX was detected during 2009. Centralizers were utilized to maintain appropriate spacing between the boring wall and, where present, adjacent casing. These wells were sampled three times (July and November 2012, and February 2013) using HydraSleeves™. The sampling procedure consisted of placing the sampling sleeves in the wells and allowing the wells to equilibrate for a sufficient period of time. For the first sampling event (July 2012), the sleeves were placed two weeks prior to sampling. Following the July 2012 event, new sleeves were lowered into the well following sampling. The sleeves, along with a new samples, were retrieved during the November 2012 sampling event. The same procedure was followed for the final February 2013 event.

Laboratory Analytical Methods and Project Action Limits: Surface water, sediment, and groundwater samples were submitted to DoD National Environmental Laboratory Accreditation Program certified laboratories for analysis. The following analytical methods were used for medium-specific analysis.

Surface water was analyzed for:

- Explosives by U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM) Standard Operating Procedure (SOP) Chromatographic Analysis Division (CAD) Method 13.3
- Perchlorate by USEPA Method SW6850
- Dissolved metals (Sb, Cu, Pb, Zn, and W) by USEPA Method 1638M
- Hardness metals (calcium and magnesium) by USEPA Method 200.7

Sediment was analyzed for:

- Explosives by USEPA Method SW8330A
- Total metals (Sb, Cu, Pb, Zn, and W) by USEPA Method SW6020
- Total organic carbon (TOC) by USEPA technical report number CE-81-1 (Walkley-Black Method)

Benthic Macroinvertebrates were analyzed for:

- Species diversity (Shannon's diversity index)
- Species richness
- Ephemeroptera, plecoptera, and trichoptera (EPT) richness
- EPT percent contribution

Groundwater was analyzed for:

- Explosives by USACHPPM SOP CAD 13.3 (2009 samples) and by USEPA 8330B (2012/2013 samples)
- Perchlorate by USEPA 6850 (2009 samples)
- Hardness metals (calcium and magnesium) plus sodium by USEPA E200.7 (2009 samples)
- Total and dissolved metals (Sb, Cu, Pb, Zn, and W) by USEPA 200.8 (2009 samples)
- U and U-isotopes by USEPA 6020 (2012/2013 samples)
- Anions (sulfate, chloride, and nitrate) by USEPA 300.0 (2009 samples)
- Alkalinity by USEPA 310.1/SM2320B (2009 samples)
- Total dissolved solids (TDS) by SM2450C (2009 samples)

PALs for surface water, sediment, and groundwater were established for the potential MCOC. For Fort Jackson and McCrady Training Center, PALs are based on the lower of either the DoD Range and Munitions Use Subcommittee (RMUS) 2012 Operational Range Assessment Screening Values Version 6.0, updated 21 May 2012 (DoD, 2012), or the South Carolina Department of Health and Environmental Control (SCDHEC) *R.61-68, Water Classifications & Standards* (22 June 2012).

For metals in surface water, the ORA and SCDHEC ecological criteria are identical. For surface water and sediment, the ORA screening values (both human and ecological) for explosives MCOC are lower and so are selected as the PALs. The ORA screening values for freshwater ecological acute and chronic toxicity of Cu, Pb, and Zn are adjusted by a formula and are inversely proportional to the measured hardness concentration[1]. Therefore, hardness concentrations were measured to calculate screening criteria for those metals with hardness-dependent criteria in surface water. All measured surface water hardness values were below 25 milligrams per liter (mg/L) Calcium Carbonate ($CaCO_3$). The surface water event/assessment area-specific PALs are listed in **Table ES-3**. MCOC concentrations detected in storm event samples were compared to the respective acute screening value. MCOC concentrations detected in all other event samples were compared to the respective chronic screening values. Sediment PALs are presented in **Table ES-3**.

For metals, explosives, and perchlorate in groundwater, PALs are based on the lower of either the ORA human drinking water screening levels (DoD, 2012) or the SCDHEC values for human health. For each MCOC listed, the ORA value was either the same or more restrictive than the SCDHEC value, so ORA values were selected as PALs. Groundwater PALs are included in **Table ES-3**.

[1] A relative increase in hardness will lower the ecological toxicity of Cu, Pb, and Zn in surface water resulting in an increase in the ecological risk screening criteria/PAL. The SCDHEC utilizes the same hardness based formulae as the ORA screening values (DoD, 2012) to calculate the ecological risk screening criteria/PAL.

Table ES-3: PALs

	Medium	SURFACE WATER					SEDIMENT	GROUND-WATER
	Screening Criteria Type	Human Health	Ecological		Selected PAL		Ecological	Human Health
	Event	All	Chronic (Wet and Dry Season)	Acute (Storm)	Chronic	Acute	All	All
Analyte	Units	(µg/L)	(µg/L)	(µg/L)	(µg/L)		(mg/kg)	(µg/L)
MCOC Metals								
Sb		5.6 [b]	30 [a]	30 [a]	5.6 [b]	5.6 [b]	12 [a]	5.6 [b]
Cu		620 [a]	2.7 [a]	3.6 [a]	2.7 [a]	3.6 [a]	34 [a]	620 [a]
Pb		15 [a]	0.54 [a]	14 [a]	0.54 [a]	14 [a]	47 [a]	15 [a]
W		NA	NA	NA	NA	NA	NA	NA
Zn		4,700 [a]	36 [a]	36 [a]	36 [a]	36 [a]	150 [a]	4,700 [a]
U and U Isotopes		Not sampled	Not sampled	Not sampled	Not sampled	Not sampled	Not Sampled	30 [c]
Perchlorate								
Perchlorate		15 [a]	9,300 [a]		15 [a]		--	15 [a]
Explosives MCOC [d]								
RDX		0.61 [a,e]	190 [a]		0.61 [a,e]		0.013 [f]	0.61 [a,e]
DNB		1.5 [a]	20 [a]		1.5 [a]		0.0067 [f]	1.5 [a]

NOTES:

mg/kg = milligrams per kilogram

mg/L = milligrams per liter

µg/L = micrograms per liter

NA = No applicable screening level is available

(a) Human health and ecological screening criteria for metals and explosives MCOC are based on DoD *Operational Range Assessment Screening Values,* Version 6.0 (DoD, 2012) for freshwater.

(b) South Carolina Water Classifications and Standards. SC Regulation § 61-68. (SC, 2012).

(c) The PAL listed is based upon the USEPA drinking water MCL for uranium of 30mg/L.

(d) RDX and Dinitrobenzene (DNB) were the only explosives MCOC detected in surface water and/or sediment at Fort Jackson and McCrady Training Center. All other explosives PALs can be found in **Appendix B** summary tables.

(e) No promulgated standard is currently available. USEPA IRIS values were used for ORA and apply here.

(f) RDX and DNB sediment screening values shown in table are based on a minimum 1 percent total organic carbon (TOC) concentration. The RDX and DNB screening values for sediments with a higher associated total organic carbon is obtained by multiplying the measured TOC (up to a maximum value of 100 percent) by the sediment PAL value shown to a maximum value of 1.3 mg/kg for RDX and 0.67 mg/kg for DNB.

3 Results and Discussion

3.1 Surface Water Assessment

Of the three watersheds evaluated, only the Gills Creek watershed results indicate that munitions constituents (Cu and Pb) were detected near the range boundary at concentrations above the PAL for ecological receptors. The results for all three watersheds are described below.

Gills Creek Watershed

Explosives and perchlorate were not detected at concentrations exceeding the PAL in any of the surface water or sediment samples collected within the Gills Creek watershed. As shown on **Figure ES-4**, Cu concentrations exceeded the PAL in two of the four surface water samples collected at the downstream location (GC2), and Pb concentrations exceeded the PAL in all four of the downstream surface water samples.

In one of the three sediment samples collected at downstream location GC2, Cu exceeded the ecological PAL and also exceeded the Cu concentrations at reference location GC1 by more than two orders of magnitude. Pb in sediment collected at GC2 exceeded the ecological PAL in two of three samples, and also generally exceeded the concentrations at the reference location GC1 by more than two orders of magnitude.

Due to the Cu and Pb exceedances in surface water and sediment, a Screening Level Ecological Risk Assessment (SLERA) was completed using data collected in Gills Creek. The SLERA found a potential for adverse health effects in aquatic life from exposure to Cu and Pb in surface water at the range boundary (Location GC2). Immediately downstream of location GC2 and the operational range boundary, Gills Creek enters Boyden Arbor Pond, which is located within the installation boundary.

Colonels Creek Watershed:

No MCOC (metals, explosives, and perchlorate) were detected above their respective PALs at the downstream locations CC3 and JC1 in either surface water or sediment. In samples from upstream/reference location CC2, Pb was detected in surface water at concentrations that exceeded the PAL. Pb and dinitrobenzene were detected in sediment at concentrations exceeding PALs. Because the sample location is upstream of operational areas, these exceedances did not originate in operational areas. Given the lack of MCOC exceeding the PALs in any of the downstream samples analyzed, the results of the Colonels Creek watershed sampling indicate that MCOC are not migrating off the operational range footprint via Colonels Creek at concentrations that could pose an unacceptable risk to human or ecological receptors.

The results of the population index evaluation for the benthic macroinvertebrate communities in Colonels Creek indicate no significant difference in metrics between the reference and downstream locations, which is consistent with the surface water and sediment sampling results.

Cedar Creek Watershed:

No explosives or perchlorate were detected at concentrations exceeding the PALs in any sediment or surface water samples collected within the Cedar Creek watershed. Cu and Pb were detected slightly above their respective PALs in one of the three sediment samples collected at WL2 (refer to Figure ES-4 for concentrations). Although concentrations of Cu and Pb in sediment exceeded the PALs at WL2, these exceedances are likely due to sources not associated with operational ranges.

Given that no MCOC were detected above the PALs in any of the samples collected at WL1 and that results from WL2 location are consistent with historical munitions usage of the MMRP site, results of the Cedar Creek watershed sampling indicate that MCOC are unlikely to migrate off

the operational range footprint via Cedar Creek at concentrations that pose an unacceptable risk to human or ecological receptors.

3.2 Groundwater Assessment

2009 Results

In 2009, the total Pb concentration in one of the 29 depth-discrete samples collected from the five borings exceeded the PAL; however, dissolved Pb in that sample was below the PAL. Total and dissolved Zn concentrations exceeded the PAL in one of the 29 samples collected. In each case, Pb and Zn were only detected above the PAL in one sampling interval. In the case of Pb, the sample which exceeded the PAL was collected at the water table. The sample collected immediately below the interval contained total Pb at a concentration well below the PAL (concentration of 3.1 µg/L compared to the PAL of 15 µg/L). For Zn, the samples collected both above and below the interval that contained the exceedances again contained Zn at concentrations well below the PAL. The total Zn concentration in the interval above was 438 µg/L while the concentration in the sample below was 577 µg/L. The PAL for Zn in groundwater is 4,700 µg/L. Because the Pb and Zn exceedances were so limited in extent, it is unlikely that these results are indicative of groundwater impacted by Pb or Zn from munitions. It is also unlikely that either Pb or Zn in groundwater presents a risk to off-range receptors.

Perchlorate was detected in eight depth-discrete samples from three of the five boring locations and in an existing water supply well on the installation near Weston Lake. All of these perchlorate concentrations were two orders of magnitude below the PAL.

RDX was detected in three depth-discrete groundwater samples collected in 2009 over an approximately 60-foot-thick interval at soil boring location SB-3. All samples were collected from the same aquifer depth intervals in which downgradient water supply wells are screened. Although all RDX concentrations were below the PAL, the presence of RDX in groundwater upgradient of, but close to the operational range boundary warranted additional assessment.

2012 – 2013 Results

The 2012 and 2013 sampling activities consisted of collecting groundwater samples from the newly installed monitoring well clusters that were installed near the operational range boundary, downgradient of the SB-3 location. Three rounds of groundwater samples were collected from the 12 new wells from July 2012 to February 2013 (for a total of 36 groundwater samples) and analyzed for explosives, U, and U-isotopes. Results for each of the three sampling events are summarized on **Figure ES-5**. As indicated on the figures, U was detected (as U-238) in one of the 36 samples at a concentration two orders of magnitude below the human health PAL. Also, the isotopic ratios indicated that the U-238 detected is naturally occurring in the groundwater and is, therefore, not related to munitions use. Multiple explosives analytes were detected in groundwater during each of the sampling events. However, only low concentrations of RDX were detected consistently.

The RDX concentrations detected exceeded the groundwater PAL in samples collected from MW-RS-04D and MW-RS-06D, which are near the operational range and installation boundary and directly upgradient of off-range receptors, during all three rounds of sampling. These results

indicate that RDX from operational range sources has reached groundwater. However, uncertainty remains regarding whether RDX is migrating off the operational range footprint.

The PAL for RDX is the USEPA's Integrated Risk Information System screening value of 0.61 µg/L. Screening values tend to be conservative and it is notable that there is no RDX drinking water maximum contaminant level (Federal standard) or state standard available for comparison. The USEPA does list 2.0 µg/L as a lifetime health advisory level for RDX. All measured concentrations in surface water and groundwater during this assessment fall well below this value.

A human health risk evaluation (HHRE) of the RDX detections in groundwater from the wells installed in 2012 near the operational range boundary was performed. The HHRE concluded that potential exposure to RDX concentrations detected in groundwater samples collected from the on-installation wells is unlikely to result in unacceptable health risks.

4 Conclusions

A summary of the CSM and conclusions for each of the watersheds and groundwater assessment area are included in **Table ES-4**. Conclusions are presented below.

Surface water, sediment, and benthic macroinvertebrate sampling data indicate MCOC are not migrating off-range via Colonels Creek or Cedar Creek. Because Cedar Creek surface water and sediment sampling data are considered conservatively representative of Mill Creek conditions, these data also indicate MCOC are not likely migrating off-range via Mill Creek. Surface water and sediment sampling data from the Gills Creek watershed included Pb and Cu concentrations exceeding PALs. The SLERA performed on those results indicates that the potential for adverse ecological health effects from exposure to sediment in Gills Creek at the operational range boundary is likely low. However, based on the low pH in surface water and low TOC in sediment, these metals may become mobile and bioavailable.

Groundwater sampling data indicate that RDX has infiltrated to groundwater. This groundwater containing detectable concentrations of RDX has migrated to groundwater monitoring wells near the operational range and installation boundary, upgradient of off-range wells used for drinking water. Uncertainty remains regarding whether RDX has migrated off the operational range. The implementation of best management practices can serve to limit or slow the migration of MCOC at Fort Jackson and McCrady Training Center.

1 Introduction

1.1 Project Purpose and Overview

ARCADIS U.S., Inc. (ARCADIS) conducted an Operational Range Assessment (ORA) Phase II study at the United States (U.S.) Army Garrison Fort Jackson (referred to as Fort Jackson throughout this report) and McCrady Training Center for the U.S. Army Corps of Engineers (USACE), the U.S. Army Environmental Command (USAEC), and the Army National Guard Directorate Installations, Logistics, and Environment Division (ARNG-ILE). The Operational Range Phase II Assessment (Phase II) was required due to the conclusions of the Phase I Assessments (Phase Is) conducted for Fort Jackson and McCrady Training Center in 2007 (Malcolm Pirnie, 2007a and 2007b) (**Figure 1-1**).

The Phase Is used readily available information to determine whether operational areas had a source of munitions constituents of concern (MCOC), a migration pathway (via surface water or groundwater systems) for MCOC, and potential receptors (human or ecological) along that pathway. The conclusion of the Phase Is at Fort Jackson and McCrady Training Center was that the available information was not sufficient to confirm whether an off-range release of MCOC is occurring at concentrations that present an unacceptable risk to human health and/or sensitive ecological receptors. A Phase II was therefore required at each installation and was designed to collect and evaluate appropriate data to determine whether or not an off-range release has occurred at concentrations above risk-based thresholds.

For operational ranges determined in the Phase Is to have a potentially complete source-receptor pathway, both the USAEC and the ARNG Directorate conduct Phase IIs to assess potentially complete pathways of MCOC to non-operational areas. As part of initiating a program to complete Phase II Assessments at all of the installations with potentially complete source-receptor pathways, USAEC and ARNG Directorate agreed in 2008 to complete a pilot study focused on the combined footprint of the two adjoining installations. This allowed both USAEC and the ARNG Directorate to provide input based on experience with the developing program and also was more efficient by completing one assessment rather than two separate assessments. This Phase II report presents the evaluation of source-receptor pathways at Fort Jackson and McCrady Training Center, South Carolina.

ARCADIS collected the Phase II quantitative assessment field data for Fort Jackson and McCrady Training Center in two phases. The initial phase of the assessment was performed from 30 March 2009 to 28 July 2009 and included the Phase II data collection efforts (collection of readily available information such as reports published since the Phase I reports, geographical information system data, Range Facility Management Scheduling System [RFMSS] data, etc.), the sampling and analysis of surface water systems, and the initial groundwater pathway sampling and analysis. A second phase of the assessment included the collection of supplementary groundwater data from 14 May 2012 to 14 February 2013, completion of a screening level ecological risk assessment (SLERA), and completion of a human health risk evaluation (HHRE). This report includes descriptions of the data collection activities and data evaluation process, data interpretation, Conceptual Site Model (CSM) refinements, and

conclusions and recommendations for the Phase II for Fort Jackson and McCrady Training Center.

1.2 Project Scope and Drivers

The U.S. Army is conducting assessments at operational ranges to meet the requirements of Department of Defense (DoD) policy and to support the U.S. Army Sustainable Range Program. The ORA is being implemented to fulfill requirements identified implicitly or explicitly in:

- DoD Directive (DoDD) 4715.11 Environmental and Explosives Safety Management on Operational Ranges Within the United States (DoD, 2004) and

- DoD Instruction (DoDI) 4715.14 *Operational Range Assessments* (DoD, 2005).

The DoDD and DoDI require that U.S. Army installations maintain an operational range inventory and evaluate the potential for off-range migration of munitions constituents. The DoDI identifies munitions constituents to be evaluated and lays out a scientifically sound process for assessing and presorting potential off-range environmental impacts of military munitions used on operational ranges. In particular, the DoDI requires the DoD components to respond to a release or substantial threat of release of MCOC from an operational range area to off-range areas, when such release poses an unacceptable risk to human health or the environment.

1.3 Work Authority

The Phase II for Fort Jackson and McCrady Training Center was performed under USACE, Baltimore District contract numbers W912DR-05-004 and W912DR-09-D-0016 and U.S. Army Engineering and Support Center, Huntsville contract number W912DY-10-D-0025. The USAEC is the Program Manager for the Phase II quantitative assessments, providing programmatic coordination for the Fort Jackson and McCrady Training Center Phase II, as designated by the Assistant Chief of Staff for Installation Management's Installation Services Environmental Division. The ARNG-ILE has program management responsibilities related to the Phase II assessment conducted concurrently at the McCrady Training Center. The USACE, Baltimore District is the executing organization and is responsible for planning and conducting the assessments. The USACE ORA Program Manager is responsible for management of the contractors' delivery orders. The U.S. Army Institute of Public Health (USAIPH) provides technical oversight for assessments completed at Active Army installations and additionally provides technical assistance to the ARNG-ILE for assessments completed at ARNG installations.

Work performed under contract numbers W912DR-05-D-004 and W912DR-09-D-0016 was completed by Malcolm Pirnie, Inc. (Malcolm Pirnie). In 2009, Malcolm Pirnie merged with ARCADIS. Throughout the remainder of this document, ARCADIS is used to represent this organization except when referencing a document prepared by Malcolm Pirnie. Work under contract number W912DY-10-D-0025 is being performed under a joint venture between Malcolm Pirnie (now ARCADIS) and PIKA International, Inc. (PIKA), collectively known as

the PIKA-Pirnie JV, LLC. Throughout the remainder of this document, this organization will be referred to as the PIKA-Pirnie JV. Activities covered under the PIKA-Pirnie JV contract include the majority of field activities completed as part of the 2012/13 phase of the assessment and preparation of this report.

1.4 ORA Phase I

Phase I qualitative assessments were performed at Fort Jackson and McCrady Training Center in 2007 (Malcolm Pirnie, 2007a and 2007b). These assessments formed the basis for the design of the Phase II assessment and are summarized briefly here.

A total of 166 operational ranges were evaluated under the Phase I assessments (104 ranges at Fort Jackson and 62 ranges at McCrady Training Center) and placed into one of two possible categories – *Unlikely or Inconclusive*. The two categories are defined as follows:

- ***Unlikely* – Periodic Review:**[2] Based on a review of readily available information, the CSM indicates that one or more of the three conditions for a source-receptor interaction is not present (*i.e.*, no source, pathway, or receptor), or where pathways are complete, data are sufficient to indicate no unacceptable risk to human health or the environment. These operational areas are placed into a periodic review cycle to re-evaluate whether a change in conditions has occurred.

- ***Inconclusive* – Phase II Required**: Readily available information is insufficient to ascertain whether MCOC from an operational area is migrating to a potential off-range receptor or the information indicates the potential for such an interaction, but risk levels are uncertain. These sites undergo a Phase II.

The types and aerial extent covered by the 166 operational ranges at Fort Jackson and McCrady Training Center are detailed in **Table 1-1**.

Table 1-1: Range Types and Aerial Extent Covered

Range Type	Fort Jackson		McCrady Training Center	
	Number of Ranges	Acreage	Number of Ranges	Acreage
Firing Ranges	8	362	2	262

[2] All operational ranges must be periodically re-evaluated to determine if there is a release or substantial threat of release of MCOC from an operational range to an off-range area. Range groups categorized as *Unlikely* are to be re- evaluated periodically. Re-evaluation may occur if significant changes (*e.g.*, changes in range operations or site conditions, regulatory changes) occur that affect determinations made during the Phase I Assessment.

Small Arms Ranges	19	501	3	48
Training Areas	75	18,968	57	14,585
Impact Areas	2	5,429	0*	0
Totals	**104**	**25,260**	**62**	**14,895**
* - Firing from McCrady Training Center live fire ranges is directed toward the impact areas at Fort Jackson.				

According to munitions data collected during the Phase I, the types of munitions fired at the installations are small caliber, medium caliber, large caliber, pyrotechnics/obscurants, and other munitions. Potential MCOC associated with these munitions types include the following:

- Explosives: Cyclotetramethylenetetranitramine (HMX), Cyclotrimethylenetrinitramine (RDX), 2,4-Dinitrotoluene (DNT), 2,6-DNT, Nitroglycerine (NG), Pentaerythritoltetranitrate (PETN), Trinitrotoluene (TNT);
- Metals: antimony (Sb), copper (Cu), lead (Pb), zinc (Zn), and tungsten (W);
- Perchlorate; and
- White phosphorus (WP).

In the Phase I, sixty-seven (67) operational ranges (53 ranges at Fort Jackson and 14 ranges at McCrady Training Center) covering 15,656 acres (13,004 acres at Fort Jackson and 2,652 acres at McCrady Training Center) having no current and/or historical sources of potential MCOC were categorized as *Unlikely*.

Ninety-nine (99) operational ranges (51 ranges at Fort Jackson and 48 ranges at McCrady Training Center) covering 28,714 acres (16,471 acres at Fort Jackson and 12,243 acres at McCrady Training Center) were categorized as *Inconclusive*. These ranges have current and/or historical sources of potential MCOC that were identified during the Phase I that have the potential to migrate off-range (**Figure 1-1**).

1.5 ORA Phase II

The strategy for the Phase II was based on the U.S. Environmental Protection Agency's (USEPA) systematic planning or data quality objective (DQO) process. The application of the DQO process is required by DoDI 4715.14. The DQO process provides a sequence of logical steps to address the sampling rationale, decision criteria, and approaches in selecting a sampling design. The DQO process is iterative and assists in determining the appropriate type, quantity, and quality of environmental data necessary for making decisions that are

technically sound and defensible. Guidance on using the DQO process can be found in *Guidance on Systematic Planning Using the Data Quality Objective Process* (USEPA, 2006a).

The structure of the ORA process is based on the DQOs. The Phase I was designed to provide the basis for Step 1 of the DQO process, which leads to the seven-step planning process for the Phase II. The Phase I was the initial gathering of data that enabled construction of a CSM and the identification of pathways that could allow MCOC from an on-range source to interact with off-range receptors at concentrations that would pose a potential risk to human health or the environment.

The Phase II uses a weight-of-evidence approach to determine whether there is an unacceptable risk to off-range human and ecological receptors from on-range MCOC sources. When appropriate, a Phase II includes sampling and analysis of media in the potential pathways for the MCOC identified in the Phase I and refined through the preliminary stages of the Phase II evaluation. The Phase II was guided in part by the U.S. Army Public Health Command (USAPHC, formerly the U.S. Army Center for Health Promotion and Preventive Medicine [USACHPPM]) *Army Operational Range Assessment Phase II Investigation Protocol* (USACHPPM,[3] 2009) and the *ARNG ORA Focus for Technical Sampling* (ARNG, 2011).

1.6 Organization of the Report

The Phase II methodology, analyses, results, and conclusions are presented in this report. The report consists of nine sections and eleven appendices:

- **Section 1 – Introduction**: Project purpose, background, work authority, and introduction to ORA
- **Section 2 – Fort Jackson and McCrady Training Center Overview**: Installation profiles, physical features, and summary of previous investigations
- **Section 3 – ORA Phase II**: CSM for the surface and groundwater pathways and technical approach for the Phase II
- **Section 4 – Methodology**: Methodologies used in the Phase II
- **Section 5 – Data Analyses**: Overview of laboratory methods and analyses
- **Section 6 – Data Results**: Results of the Phase II and other evidence used to reach conclusions
- **Section 7 – Screening Level Risk Assessments**: Summaries of the SLERA for the surface water pathway and the HHRE for the groundwater pathway.
- **Section 8 – Summary of Findings and Conclusions**: Summary of the findings and the conclusions of the Phase II.

[3] The USAIPH was formerly the U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM).

- **Section 9 – References**: List of all documents used in the preparation of the Phase II report
- **Appendix A – Photograph Log**: Photographs taken at the sampling locations
- **Appendix B – Laboratory analytical reports**: Laboratory analytical reports have been compiled and included in this appendix.
- **Appendix C – Trip Reports**: Trip reports documenting decisions and changes to procedures occurring in the field
- **Appendix D – Field Forms**: Documents and notes completed in the field: chain of custody (COC), field safety forms, and surface water, sediment, and groundwater sample collection logs
- **Appendix E – Soil Boring and Well Construction Logs:** Soil boring logs and monitoring well construction logs for all wells including piezometers
- **Appendix F – IDW Sampling Results**: Laboratory results for investigative-derived waste (IDW) samples submitted for analytical testing
- **Appendix G – Data Usability Summary Reports**: Tier III Data Validation Report prepared for each Sample Delivery Group as assigned by the laboratory
- **Appendix H – Statistical Evaluation for Surface Water Assessment**: Includes summaries of the statistical evaluations of surface water, sediment, and benthic macroinvertebrate data.
- **Appendix I – Screening Level Ecological Risk Assessment**: Contains a SLERA which evaluates the potential for adverse health effects in ecological receptors associated with the Fort Jackson and McCrady Training Center Phase II
- **Appendix J – Human Health Risk Evaluation**: Contains an HHRE which evaluates the potential for adverse health effects in human receptors associated with the Fort Jackson and McCrady Training Center Phase II

2 Fort Jackson and McCrady Training Center Overview

2.1 Installation Background

Fort Jackson and McCrady Training Center are adjoining installations, together occupying approximately 51,961 acres in Richland County, South Carolina (**Figure 2-1**). The South Carolina Army National Guard (SCARNG) holds a nonexclusive license for training operations on approximately 15,267 acres of the eastern portion of Fort Jackson. These 15,267 acres comprise the McCrady Training Center.

Fort Jackson was established in 1917 as an infantry training center (then known as Camp Jackson). The installation was inactive from 1921 to 1925. In 1925, the War Department decided to use the post again as a training camp for the SCARNG. From 1925 to 1939, the state controlled the site and used it as an encampment and training area for SCARNG troops. During World War II, Fort Jackson became a permanent military installation used primarily for infantry training. Additional property was acquired on the eastern and northern sides of the installation until the acreage reached approximately 52,000 acres. In 1943, the land for McCrady Training Center, formerly referred to as Leesburg Training Center, was licensed to the SCARNG by the Department of the Army.

Fort Jackson is the largest and most active initial entry center in the U.S. Army. The installation instructs participants in Basic Combat Training, Advanced Individual Training, and many professional schools. Currently, McCrady Training Center is the largest of the SCARNG training centers and is the primary facility for the SCARNG, supporting federal missions and serving as a staging site for state missions. The 218th Regiment (Leadership) Total Army School, located at McCrady Training Center, serves as the schoolhouse for the southeastern region (USAEC and USDA, 2001).

The Army Range Inventory Database-Geodatabase (ARID-GEO) (2006a) identified 104 operational range areas at Fort Jackson encompassing a total of 29,475 acres. The operational areas support a variety of range uses, including live-fire weapons training, heavy and light maneuver exercises, dudded and non-dudded impact areas, and specialty training courses, such as night-infiltration and military operations in urban terrain. Many of these ranges are heavily used by soldiers undergoing basic training. The ARID-GEO for McCrady Training Center (2006b) identified 62 operational ranges encompassing 14,895 acres. The McCrady Training Center ranges support live-fire weapons training and heavy and light maneuver exercises.

2.1.1 Medium and Large Caliber (Explosive) Live-Fire Ranges

There are eight firing ranges at Fort Jackson covering approximately 362 acres and two additional firing ranges at McCrady Training Center covering approximately 262 acres. These ranges include all medium and large caliber firing ranges identified in ARID-GEO (2006), as well as several additional medium and large caliber firing ranges identified using RFMSS data. Small caliber munitions, pyrotechnics/ obscurants, and munitions identified as other or unknown are also utilized at some of these ranges.

2.1.2 Small Arms Live-Fire Ranges

There are 19 small arms ranges at Fort Jackson covering approximately 501 acres. Seventeen of these are located along the perimeter of a 4,216-acre impact area in the western portion of Fort Jackson's operational range area within the Gills Creek Watershed. McCrady Training Center operates three additional small arms ranges covering approximately 48 acres, with two of the ranges located in the western half of Fort Jackson's operational range area. The third is located in the southeast corner of the installation. In addition to small caliber munitions, pyrotechnics/obscurants and munitions identified as other or unknown are also utilized at some of these ranges.

2.1.3 Training Areas

Seventy-five training areas covering approximately 18,968 acres are present within Fort Jackson. Twenty-five of these, totaling 5,446 acres, are non-live-fire maneuver and training areas or obstacle courses where limited or no current or historical munitions usage has occurred. Historical munitions usage was identified at 33 training areas covering 9,204 acres. Fifteen training areas contain artillery or mortar firing points and/or known or suspected dudded areas. The remaining two training areas are entirely overlapped by firing ranges. These areas have historical overlapping range fans used for small arms, medium caliber, large caliber, and additional unidentified historical military munitions training. Based on information from Fort Jackson's Range Operations (formerly Range Control) office, an unexploded ordnance (UXO) surface removal action has been performed at these training areas; therefore, there is a low probability of encountering UXO items at the ground surface except where erosion has since occurred. A total of 12 training areas, totaling 3,324 acres, contain known or suspected dudded areas identified by Fort Jackson Range Operations. These areas are the result of historical training activities, primarily mortar and grenade firing ranges. These areas are clearly demarcated on Fort Jackson's Installation Field Map (Fort Jackson ITAM, 2006). Signs are posted to alert personnel to the potential presence of UXO. Five of these training areas, plus three other training areas, contain mortar or artillery firing points.

McCrady Training Center includes 57 training areas covering approximately 14,585 acres. Fourteen of these training areas, totaling 2,652 acres, are non-live-fire maneuver and training areas where limited or no current munitions use occurs and no historical munitions usage has occurred. Historical and/or current training involving the use of munitions has been identified at the other 43 training areas, totaling 11,933 acres. Eighteen training areas, including 16 training areas with historical munitions usage, are currently used for training activities involving the use of munitions at artillery or mortar firing points and/or suspected dudded areas. Two of the training areas that received heavy historical usage also reportedly contain demolition areas. RFMSS data collected as part of the Phase I indicate that use of this temporary demolition area began in 2007.

2.1.4 Impact Areas

Two impact areas are present at Fort Jackson, including a large, dudded area in the eastern portion of Fort Jackson comprising 5,429 acres and a slightly smaller mostly non-dudded impact area in the western portion comprising 4,216 acres. No impact areas are present within the limits of McCrady Training Center.

The eastern dudded impact area is the established impact area for mortar and artillery weaponry training. It contains range safety fans for a number of small, medium, and large caliber firing ranges located around the perimeter of the area and includes an Engineer Demolition Site. This area was also historically known as the south impact area and was used as an impact zone for a number of large caliber training ranges. No surface clearance activities have been performed at the eastern dudded area.

The western impact area covers 4,216-acres and is mostly non-dudded. It is surrounded by 19 permanent small arms ranges (two of which are licensed to the SCARNG for training purposes). This impact area contains the safety fans associated with each of the 19 small arms ranges. The safety fans encompass more land than that which is actually impacted because about 90% of the rounds fired are contained by berms constructed 30-320 meters down range from firing lines; however, not all of the ranges are bermed (Fort Jackson Directorate of Plans, Training, and Mobilization, and Security (DPTMS), 2006). This entire impact area is defined as non-dudded impact area in ARID-GEO (2006); however, Fort Jackson's Range Operations personnel have identified known dudded areas to be present in the western portion. This is consistent with historical locations of mortar ranges. The dudded portion of the western impact area covers 273 acres.

2.1.5 Munitions Data

Munitions use data (*i.e.*, RFMSS) collected during the Phase I provided information on the types and numbers of munitions fired at Fort Jackson and McCrady Training Center; these data are summarized in **Table 2-1**. Munitions use data from reflect annual munitions usage averaged over the period of available data (1 January 2002 through 12 October 2006 for Fort Jackson and 1 January 2004 through 18 May 2007 for McCrady Training Center). Approximately 216,000 rounds were recorded without a Department of Defense Identification Code; these rounds are tabulated as having an unknown munitions type. Based on the use of the ranges where these munitions were fired, most of the rounds were likely live-fire, small caliber rounds.

Approximately 17 million rounds of military munitions were utilized per year during the period of available data. More than 95 percent of these were small arms rounds, including a total of approximately 1.1 million small arms tungsten rounds[4]. Several munitions quantities have been modified to correct RFMSS errors that were confirmed by DPTMS personnel. RFMSS does not show munitions usage for the impact areas because the firing that was aimed toward these areas took place from the other ranges.

[4] In an attempt to reduce lead usage at small arms ranges, lead-free tungsten composite rounds were used at several Fort Jackson ranges and at one of McCrady Training Center's small arms ranges and one of its firing ranges. According to RFMSS data, the period of heaviest use for the tungsten-nylon small arms rounds was in 2003 and 2004. Due to potential environmental impacts, usage of tungsten composite rounds was suspended at Army installations by the Department of the Army in spring 2006.

Table 2-1: Munitions Data Summary by Range Type

Range and Munitions Type	Fort Jackson Rounds Expended per Year [d]			McCrady Training Center Rounds Expended per Year [e]			Total Rounds Expended[f]
	Live-Fire	Practice/ Blank	Total[f]	Live-Fire	Practice/ Blank	Total[f]	
Large and Medium Caliber (Explosive) Live-Fire Ranges							
Small Caliber	2,512,000	121,000	2,633,000	1,126,000	530	1,126,000	3,759,000
Medium Caliber	40,000	40,000	80,000	65,000	2,400	68,000	148,000

[a] Unknown munitions type indicates an entry of "Not Applicable" in the DoD Identification Code column of the RFMSS data; therefore, the number of rounds cannot be associated with a munitions type (DA, 2000).
[b] Munitions quantity edited to correct RFMSS error identified by Fort Jackson DPTMS personnel.
[c] Practice fuzes
[d] Data based on munitions expended expended at Fort Jackson from 1 January 2002 to 12 October 2006 and normalized to annual usage
[e] Data based on munitions expended at McCrady Training Center from 1 January 2004 to 18 May 2007 and normalized to annual usage
[f] Rounded to the nearest thousand or two significant digits, if less than one thousand

2.2 Physical Description

2.2.1 Climate

The region surrounding Fort Jackson and McCrady Training Center has a temperate continental climate with hot, humid summers and mild winters. This southern temperate region can experience temperatures ranging from below freezing to greater than 100 degrees Fahrenheit (ºF); however, there is a relatively narrow annual temperature range, from a mean daily temperature of 81ºF in July to 44ºF in January (Gene Stout & Associates, 2004). Average annual precipitation is approximately 46 inches. July and August are the wettest months with

approximately 5.5 inches of precipitation each month. Although July is one of the wettest months of the year with respect to precipitation, the net precipitation (i.e. precipitation - evaporation) and streamflow are low at this time of year. The evaporation potential generally exceeds precipitation during the summer months; therefore, net precipitation is highest in the winter months (**Figure 2-2**). Tropical storms producing heavy rainfall occasionally occur during late summer and early autumn. Wind speeds peak at approximately nine miles per hour in spring, and the general wind direction is from the southwest. Snowfall is rare and generally results in little, if any, accumulation (USATHAMA, 1980).

2.2.2 Topography

Gentle to moderately rolling, moderately dissected high plains occupy most of Fort Jackson and McCrady Training Center. These high plains are interrupted by the nearly flat alluvial plains of Gills, Cedar, and Colonels creeks and their tributaries and an irregularly distributed, gently sloping, low relief area in the central portion of the installation near the headwaters of Cedar Creek. Local relief in the high plains is largely 165-250 feet. Slopes are predominantly three to eight percent; however, along narrow stream valleys, slopes commonly exceed 15 percent. Elevations in the high plains are mostly 295-459 feet above mean sea level. The lowest elevation in the high plains is about 200 feet, adjacent to the alluvial plain of Colonels Creek in the eastern portion of the installation. The highest elevation, 540 feet, is at Weir Tower in the west-central portion of the installation (Gene Stout & Associates, 2004).

Flat to gently rolling low plains characterize the extreme western portion of the installation, including a major portion of the cantonment area and the alluvial plains occupied by southwesterly flowing Gills and Mill creeks. Local relief around the valley of Gills Creek and its tributaries is generally less than 60 feet. Slopes are predominantly between zero and three percent on the alluvial plains, and slopes in the cantonment area are predominantly between three and eight percent. Upper valleys of Mill and Cedar creeks occupy low plains along the southern boundary of Fort Jackson. Local relief is generally less than 40 feet, and slopes are usually less than three percent (Gene Stout & Associates, 2004).

2.2.3 Soils

Four major soil types are present at Fort Jackson and McCrady Training Center: Lakeland, Vaucluse-Ailey-Pelion, Fuquay-Troup-Vaucluse, and Pelion-Johnson-Vaucluse (USATHAMA, 1980). Lakeland soils are the predominant soil type at Fort Jackson and McCrady Training Center and are found at higher elevations in the central part of Fort Jackson and McCrady Training Center along ridgetops (Gene Stout & Associates, 2004). They consist of deep, gently to strongly sloping, and highly permeable sandy soils. Vaucluse-Ailey-Pelion soils are found along the Colonels Creek watershed in the east and southeastern portions of Fort Jackson and McCrady Training Center. They consist of well-drained to moderately well-drained soils that have a sandy surface layer and a loamy subsoil. Fuquay-Troup-Vaucluse soils are found along Mill Creek and Cedar Creek in two small areas along the southern installation boundary. They consist of well-drained soils with sandy surface and subsurface layers and a loamy subsoil. Pelion-Johnson-Vaucluse soils are found on the western portion of Fort Jackson along the Gills Creek watershed. They consist of moderately well-drained soils that have a sandy surface layer and a loamy subsoil, very poorly drained soils that are loamy throughout, and well-drained soils that have a sandy surface layer and a fragipan in the loamy subsoil (USATHAMA, 1980; Gene

Stout & Associates, 2004). The high sand content of soils at Fort Jackson and McCrady Training Center promotes leaching of minerals, reduced water retention, and increases susceptibility to soil erosion (USATC, 2005).

2.2.4 Geology

The geology of South Carolina is characterized by two principal physiographic and geologic provinces, the crystalline rocks of the Piedmont physiographic province and the unconsolidated sediments of the Coastal Plain. The boundary between the Piedmont and the Coastal Plain is marked by the Fall Line, which occurs approximately four miles west and north of Fort Jackson's cantonment area (USATHAMA, 1980; Newcome, 2003). Fort Jackson and McCrady Training Center lie on the northwestern edge of the Coastal Plain province, a region of low to moderate relief and gently rolling plains, known as the Sand Hills. The installations sit directly on the unnamed sediments of Tertiary age and the upper Coastal Plain portion of the Cretaceous aged Middendorf Formation (Kite, 1988; USGS, 1994 and 1996). The majority of both installations sits directly on the Middendorf Formation, with Tertiary sediments locally capping uplands on the southern half of each of the installations.

The Middendorf Formation (also referred to as the Tuscaloosa Formation) consists of deltaic deposits of light-colored sands and kaolin clays. Most soils at Fort Jackson and McCrady Training Center are formed from sediment of the Middendorf Formation. The Middendorf Formation thickens considerably to the southeast, sitting on top of crystalline bedrock that dips to the southeast at approximately 25 feet per mile. The thickness of the unconsolidated sediments varies considerably across the installation depending on the distance from the fall line and the local topography, with total thickness of unconsolidated sediments of the Tertiary units and Middendorf Formation varying from approximately 300 feet in the northwestern portion of Fort Jackson to approximately 500 feet in the southwestern corner of McCrady Training Center.

2.2.5 Hydrogeology

The Middendorf Aquifer constitutes the primary aquifer used as a groundwater supply in the area including, and surrounding, Fort Jackson and McCrady Training Center. Within this region, the Middendorf Formation is entirely coincident with the Middendorf Aquifer. Half the wells occurring within the Middendorf Aquifer in Richland County are less than 100 feet deep. In the area directly to the south of Fort Jackson and McCrady Training Center the overwhelming majority of wells screened within the Middendorf Aquifer are screened above elevations of 175 feet above mean sea level. Wells located several miles north of the installation extract groundwater from bedrock aquifers, but very few wells on the installation or directly south of the installation extract groundwater from the bedrock aquifers due to the great depths (and therefore well installation expense) to bedrock.

Depths to water on-installation and immediately downgradient (to the south) generally range from two to 20 feet below ground surface (bgs) within the cantonment area and directly adjacent to streams (USATHAMA, 1980), up to a maximum depth of over 100 feet on highlands in interstream areas near the central part of the combined installations (LAW, 2003). The aquifer system in the region is described as stratified, consisting of shallow, intermediate, and deep groundwater flow systems (USGS, 1996). Fort Jackson and McCrady Training Center represent an important local and regional recharge area for the Middendorf aquifer system. The majority

of groundwater recharging the aquifer is expected to remain within the shallow and intermediate flow system and follow topography, ultimately discharging to local streams and rivers (**Figure 2-3**). A smaller proportion of recharge enters the deep groundwater flow system and discharges to regional discharge points. The Congaree and Wateree rivers to the south and east of the installation, respectively, have been identified as regional discharge points for the deep component of the groundwater system in Richland County (USGS, 1987). Regional groundwater flow directions along with other features of the groundwater system are shown on **Figure 2-4**.

As indicated on **Figure 2-3,** water infiltrating to shallow groundwater on-installation within the southern half of the combined installation generally flows in a southerly direction as does the groundwater flow in the intermediate and deep flow systems. Flow velocities in the shallow and intermediate portion of the aquifer were calculated using hydraulic gradients measured as part of this assessment and hydraulic conductivities measured during a previous investigation by Law Engineering and Environmental Services (2003). Horizontal flow velocities using these data varied from 34 to 368 feet per year. As shown on **Figure 2-3**, the area located south of the southern Fort Jackson installation boundary and west of Weston Lake is serviced by water supply infrastructure servicing Columbia and its suburbs. As such, it is unlikely that groundwater is utilized for drinking water purposes in this portion of the hydraulically downgradient area. This infrastructure does not extend to Weston Lake. Well logs obtained from Fort Jackson and the South Carolina Department of Natural Resources (SCDNR) indicated that the aquifers to the south and southeast of the installations are utilized for drinking water. Numerous groundwater supply wells are utilized to supply recreational facilities at Weston Lake. Additionally, numerous residential drinking water wells and larger supply wells were identified in the area south of the combined installations and to the east of Weston Lake (**Figure 2-3**). During a windshield survey completed in the area, dozens of additional wells not included in the database obtained from the SCDNR were also observed. Although no information is available for these wells, they are likely similarly utilized for residential drinking water as those included in the well database.

2.2.6 Hydrology / Surface Water

There are 26 lakes, ponds, and impoundments on Fort Jackson and McCrady Training Center. These water bodies range in size from 0.5 to 173 acres; however, most are less than 35 acres. Five ponds and two lakes are adequate for intensive fisheries management (Old Heises Pond, South Pond, Upper Barstow Pond, Lower Barstow Pond, Odom Pond, Upper Legion Lake, and Big Twin Lake). Remaining lakes and ponds are maintained for waterfowl habitat, recreation, aesthetics, and irrigation water supply for golf courses. The largest lake, Weston Lake, is north of Leesburg Road east of the cantonment area. The lake has a surface area of about 173 acres and accounts for more than one-third of the total impounded surface acreage for the installation. Weston Lake is also the installation's primary waterside recreation lake, with camping facilities, picnic shelters, a community house, a beach pavilion, and a swimming area (Gene Stout & Associates, 2004).

Fort Jackson and McCrady Training Center is located within the Santee River Basin and the Congaree River subbasin. All creeks and streams leaving Fort Jackson and McCrady Training Center eventually flow into either the Wateree River or the Congaree River. These rivers meet about 16 miles southeast of Fort Jackson and McCrady Training Center, where they form the

Santee River, the principal stream of the region. The Santee River continues in a southeasterly direction, eventually emptying into the Atlantic Ocean south of Georgetown, South Carolina (Gene Stout & Associates, 2004).

Fort Jackson encompasses five watersheds or subwatersheds, as shown on **Figure 2-5**. These watersheds are drained by Colonels, Gills, Wildcat, Mill, and Cedar creeks described below.

Colonels Creek Watershed
The headwaters of Colonels Creek originate on Fort Jackson and McCrady Training Center. This is a predominantly wooded watershed. Colonels Creek drains the eastern portion of the installation, including the area licensed to the SCARNG McCrady Training Center, and flows southeast to the Wateree River, a tributary of the Congaree River.

Gills Creek Watershed
Gills Creek, in the northwest portion of Fort Jackson, drains the small arms ranges and western impact area, as well as non-live-fire training areas, and flows into Boyden Arbor Pond before resuming downstream of the installation. Gills Creek drains a primarily forested watershed on Fort Jackson and a predominantly urban watershed downstream of Fort Jackson. Gills Creek downstream of Fort Jackson is listed as impaired for fecal coliform and dissolved oxygen (DO) on South Carolina's 2012 Clean Water Act Section 303(d) list of water quality limited segments (Gene Stout & Associates, 2004; SCDHEC 2012).

The United States Geological Survey (USGS) maintains a stream gauge on Gills Creek downstream of Fort Jackson within the city of Columbia. **Figure 2-2** shows that evapotranspiration has a strong influence on stream flow rate within Gills Creek and that months with the highest precipitation do not correspond to the months with the highest stream flow rate. This is consistent with conditions common in forested areas of the southeastern United States.

Wildcat Creek Watershed
Wildcat Creek drains a small portion of the cantonment area and flows to the west, where it enters Gills Creek just below Lake Katherine. None of the operational range areas are drained by Wildcat Creek.

Mill Creek Watershed
Mill Creek drains an area in the southwest portion of the training areas and flows off-post to the south, where it eventually enters the Congaree River. The Mill Creek watershed encompasses a small area in the southern portion of the non-dudded impact area (including two small arms ranges), wooded training areas, and the Twin Lakes recreational area located on-post.

Cedar Creek Watershed
Cedar Creek drains the majority of a large dudded impact area and flows southward through the Weston Lake Recreation Area, eventually entering the Congaree River.

2.2.7 Ecological Setting

Two federally listed endangered plant species, rough-leaved yellow loosestrife (*Lysimacia asperulaefolia*) and smooth purple coneflower (*Echniacea laevigata*), occur at or near Fort Jackson and McCrady Training Center. Rough-leaved yellow loosestrife is found just west of the

installation boundary along Buffalo Creek. Smooth purple coneflower has been documented adjacent to Statue of Liberty Road in the northern portion of Fort Jackson. Since these plants are located in narrowly defined areas within the operational training ranges, it is not expected that they would be found at off-installation locations. In addition to the smooth purple coneflower and the rough-leaved yellow loosestrife, two other unlisted rare species occur at McCrady Training Center: the crestless fringed orchid (*Pteroglassaspis ecristata*) and the Indian olive (*Nestromia umbellula*) (USAEC and USDA, 2001). The Nature Conservancy ranks both species as imperiled statewide (USAEC and USDA, 2001). One federally listed endangered animal, the red-cockaded woodpecker (*Picoides borealis*), is a resident of Fort Jackson and McCrady Training Center. The red-cockaded woodpecker is endemic to the pine forests of the southeastern United States. It is found most commonly in the longleaf pine ecosystems. Due to the wide presence of the red-cockaded woodpecker on Fort Jackson and McCrady Training Center and the presence of similar habitat off range and off installation, it is expected that the red-cockaded woodpecker is present off range as well. Two additional federally endangered species, the shortnose sturgeon (*Acipenser brevirostrum*) and Canby's dropwort (*Oxypolis canbyi*), are found in the vicinity of Fort Jackson and McCrady Training Center, but are not known to occur at the installation. The American Bald Eagle (*Haliaeetus leucocephalus*), which is listed by the SCDNR as a state endangered species (SCDNR, 2006), is a transient visitor to the installation as is the state endangered Rafinesque's big-eared bat (*Corynorhinus rafinesquii*). No American bald eagle nests or permanent roost sites are known to occur on this installation.

Fort Jackson and McCrady Training Center can be classified into five primary terrestrial vegetative types: pine, pine/upland hardwood, upland hardwood, bottomland hardwood, and open field. There are no grassland areas on Fort Jackson, except for a small amount in the cantonment area and alongside roads. Vegetation on Fort Jackson and McCrady Training Center is diverse and abundant. Field investigations and surveys have identified over 750 species of flora on the installation. Forest cover is the principal vegetative type and may be grouped into eight major forest types: Natural Pine, Pine Planation, Pine Scrub Oak, Pine Hardwood, Scrub Oak, Upland Hardwood, Bottomland Hardwood, and Hardwood Pine. Natural Pine is the most important forest type on the installation and includes all natural pine stands, regardless of species, in which less than 20 percent of the basal area of overstory trees is hardwoods or less than 20 percent of the basal area is dominated by scrub oak (Gene Stout & Associates, 2004).

Forested areas occupy the majority of the installation, with the exception of the firing ranges and the cantonment area. The dudded and non-dudded impact areas in the center of the installation, as well as the training areas along the outskirts of the installation, are mostly covered with thick vegetation consisting of mature pines and scrub oaks. There are, however, several sandy areas that are not vegetated and that are prone to erosion. These areas have been surveyed by personnel in Fort Jackson's Environmental Division (ENV).

2.3 Summary of Previous Investigations

2.3.1 White Phosphorus Wetland Storage Installation Assessment (USACE, 1993)

The U.S. Army Corps of Engineers performed a White Phosphorus Wetland Storage Installation Assessment at Fort Jackson in 1993 to determine whether white phosphorus (WP) was present in areas potentially attractive to wildlife, particularly waterfowl. Sediment samples were collected

from 12 locations around Fort Jackson that were deemed most likely to store WP based on historical or current use of WP-containing munitions. Five of the sampling locations were near the eastern dudded impact area, and two locations were near the western impact area (the five other sampling locations were near a recreational area). None of the samples contained WP above the analytical detection limit of 0.00096 milligrams per kilogram (mg/kg) (wet weight). The report concluded that the risk to waterfowl from WP storage in the Fort Jackson wetlands is negligible (USACE, 1993). Additionally, a summary report issued by USACE in 1996 stated that out of 39 samples collected at Fort Jackson, none contained WP levels over 0.00096 mg/kg (USACE, 1996).

2.3.2 Small Arms Ranges Study (Bricka, 2002)

Mississippi State University staff, headed by Dr. R. Mark Bricka, performed a study from 2001 to 2002 to evaluate the potential of off-installation migration of MCOC, particularly metals, from the small arms ranges located around the northern perimeter of the non-dudded impact area in the Gills Creek watershed. This study involved the collection of surface and subsurface soil samples from several ranges, as well as surface water and sediment samples from the creeks that drain the small arms ranges (*i.e.*, Bynum, Rowell, and Mack creeks, which drain into Gills Creek). The data showed that soil containing elevated concentrations of Pb is present on the small arms ranges. Also, because the small arms ranges contain sandy soils and are intersected by a network of creeks, the potential for erosive conditions is high, so that Pb-contaminated soil was shown to be entering several of the smaller creeks that drain into Gills Creek. The results of the sediment sampling indicated that from Gills Creek, sediment travels into Boyden Arbor Pond, primarily during larger rain events. The authors of the study stated that "it is also suspected that little Pb is moving off post because of the size of Boyden Arbor Pond and that the sediment Pb levels at the discharge end of the pond are quite low." While information from the study is useful from a general perspective, the data from the Bricka study cannot be used to assess potential off-range migration of Pb from the small arms ranges in the Gills Creek watershed because detection limits in the Bricka study do not meet the Phase II DQOs (*i.e.*, the method detection limits from the Bricka study are higher than the Phase II PALs for lead).

2.3.3 Small Arms Ranges Study (USATC, 2005)

The U.S. Army Aberdeen Test Center also performed a study to evaluate the potential of off-installation migration of MCOC, particularly metals, from the small arms ranges located around the northern perimeter of the non-dudded impact area in the Gills Creek watershed. This study involved a watershed-based assessment of the small arms ranges. The study included the installation of three shallow groundwater monitoring wells (MW-1, MW-2, and MW-3) at a small arms range to depths of approximately 13.5 to 14.5 feet bgs. Dissolved Pb results from MW-1 were as high as 2,900 ppb, while maximum dissolved Pb results from MW-2 and MW-3 were 6 ppb and 30 ppb, respectively. The core sections for MW-1 showed a sandy profile, while cores for MW-2 and MW-3 indicated that there is a localized confining condition (*i.e.*, clay lens) that prevents direct communication between the ground surface and groundwater. Groundwater samples were also collected from two potable water supply wells located near the small arms ranges. These wells are screened in the Middendorf Formation at depths of 174 feet bgs and 105 feet bgs. Pb concentrations for groundwater samples from both of the wells were lower than the 15 ppb Pb National Drinking Water Action Level.

The study authors noted that there was visual evidence of significant soil erosion and sediment transport from the impact berms on many ranges. Analytical results from three rounds of baseflow surface water sample collection suggested that the range areas were contributing to Pb concentrations in surface water immediately downstream of the small arms ranges. Similarly, storm water grab sample analytical data also indicated that runoff was increasing Pb concentrations in each creek. Regarding groundwater impacts, the study concludes that they are limited to the shallow base flow discharging to the creeks. The authors of the study stated that "range use effects on surface water resources are not detectable at the overall training area boundary or installation boundary". However, the data from the USATC study cannot be used to assess potential off-range migration of Pb from the small arms ranges in the Gills Creek watershed, because detection limits in the USATC study do not meet the Phase II DQOs.

2.3.4 Numerous Installation Restoration Program (IRP) Investigations

A number of investigations completed under the IRP evaluated MCOC concentrations in soil and shallow groundwater near the southern combined installation boundary east of Weston Lake. In general, the data collected as part of these investigations did not meet the DQOs being utilized as part of the current assessment. Therefore, the data could not be utilized as part of this assessment. However, as part of these evaluations, slug tests were performed within shallow wells near former open demolition areas. The data are utilized within this report to estimate aquifer properties and travel times in groundwater.

There are several areas on Fort Jackson and McCrady Training Center where munitions were utilized or disposed that are being addressed under Fort Jackson's Resource Conservation and Recovery Act (RCRA) Part B permit issued by the South Carolina Department of Health and Environmental Control (SCDHEC) in September 1991. Although these areas are potential sources of MCOC, they are not evaluated under the ORAP because they are addressed under the conditions of their permit. Permitted open burn (OB)/open detonation (OD) areas are programmatically excluded from ORAP because the conditions of their permit address potential MCOC migration from these areas. They are briefly described here for informational purposes only as they are located within operational range areas characterized as *Inconclusive* during the Phase I. The two sites are the Inchon and Wonsan Ordnance Disposal Sites.

Fort Jackson and McCrady Training Center historically utilized these two sites for disposal of explosive ordnance, both by OB and OD. The Wonsan Explosive Ordnance Disposal (EOD) site is located within McCrady Training Center less than one mile from the southern installation boundary. The Inchon EOD site is located to the east of Weston Lake within Fort Jackson and is also located less than one mile from the southern combined installation boundary. Groundwater in this area flows to the south off-range and off-installation.

Inchon Explosive Ordnance Disposal Site

The six-acre Inchon EOD site was first used by the 48th EOD Detachment to dispose of unserviceable ammunition in 1973. Use of the site was discontinued in 1981. Disposal consisted of burning small arms ammunition in trenches and detonating larger ordnance in pits. The Inchon EOD site is designated as Solid Waste Management Unit (SWMU) 17 in Fort Jackson's IRP. Field activities to support a RCRA Facility Investigation were conducted in 1991, 1993, 1999, and 2000. Samples were collected from shallow soil, subsurface soil, surface water, sediments,

and groundwater and analyzed for a variety of analytes, including explosives and metals. Groundwater concentrations were compared to the National Drinking Water Action Level of 15 parts per billion (ppb) for lead and the 2000 USEPA Region IX Preliminary Remediation Goals for Residential Soil and Tap Water. Soil concentrations were compared to USEPA Ecological Screening Values (ESVs) for surface soil (dated August 1999). Positive detections were noted primarily for metals in soil, including arsenic, barium, cadmium, chromium, and lead. A screening level ecological risk assessment was performed in accordance with USEPA (1997) guidance. This assessment determined that constituents present in the soil and groundwater at the Inchon site do not pose a threat to human health or the environment; however, potential UXO that remains in the soil at the site may pose a safety risk and serve as a potential ongoing source of MCOC as the munitions degrade. Additionally, it should be noted that some comparison criteria referenced in this study are now outdated. Fort Jackson is implementing land use controls to prevent access to this site (LAW, 2003; USAEC, 2005). As part of the investigations completed at the site, slug tests were completed in shallow wells to estimate K-values for the Middendorf Aquifer in the area. The K-values were utilized during development of the technical approach for the current assessment and subsequent analysis of data.

Wonsan Explosive Ordnance Disposal Site

The Wonsan EOD site consists of two areas separated by an east-west firebreak: a one-acre area north of the firebreak and a two-acre area south of the firebreak. The Wonsan EOD site was used by the 48th EOD Detachment to dispose of unserviceable ammunition from 1961 to 1978. Disposal consisted of burning small arms ammunition in trenches and detonating larger ordnance in pits. The Wonsan EOD site is designated as SWMU 12 in McCrady Training Center's IRP. Four field events (in 1991, 1993, 1999, and 2000) were conducted to support a RCRA Facility Investigation. Samples were collected from shallow soil, subsurface soil, surface water, and groundwater and analyzed for a variety of analytes, including explosives and metals. Groundwater concentrations were compared to the National Drinking Water Action Level of 15 parts per billion (ppb) for lead and the 2000 USEPA Region 9 Preliminary Remediation Goals for Residential Soil and Tap Water. Soil concentrations were compared to USEPA Ecological Screening Values for surface soil (1999). The primary constituents of concern for surface soil were determined to be chromium and lead. A screening level ecological risk assessment was performed in accordance with USEPA guidance (1997). This assessment determined that MC present in the soil and groundwater at the Wonsan EOD site do not pose a threat to human health or the environment; however, potential unexploded ordnance (UXO) that remains in the soil at the site may pose a safety risk and serve as a continuing source of MCOC as the munitions present degrade. Additionally, it should be noted that some comparison criteria referenced in this study may be outdated. and McCrady Training Center is implementing land use controls to prevent access to this site (LAW, 2003; USAEC, 2005). As part of the investigations completed at the site, slug tests were completed in shallow wells to estimate K-values for the Middendorf Aquifer in the area. The K-values were utilized during development of the technical approach for the current assessment and subsequent analysis of data.

2.4 Phase I Conceptual Site Model

The Phase I CSM provided the initial basis of the Phase II. The CSM identified pathways that could allow MCOC from an on-range source to interact with off-range receptors at concentrations that could pose potential risk to human health or the environment.

A summary of potential MCOC associated with each range region/type is presented in Table 2-2.

Table 2-2: Potential MCOC (Current and Historical) at Fort Jackson & McCrady Training Center

Range Type	Source Area / Munitions Type	Potential MCOC
Firing Ranges	Squad defense ranges, convoy live-fire ranges, hand grenade ranges, tank stationary gun ranges, demolition range, artillery firing points, tank scaled range, anti-air weapon range	2,4-DNT, 2,6-DNT, HMX, nitroglycerine, PETN, RDX, TNT, perchlorate, Pb, Sb, Cu, Zn, and W
Small Arms Ranges	19 small arms ranges	NG, Pb, Sb, Cu, Zn, and W
Training Areas	Artillery firing points and areas currently used for maneuver / field training that fall within historical range fans for small, medium, and large caliber training ranges	2,4-DNT, 2,6-DNT, PETN, RDX, NG, Pb, Sb, Cu, and Zn
	Known or suspected dudded areas resulting from historical training activities involving primarily mortar and grenade firing	2,4-DNT, 2,6-DNT, HMX, PETN, RDX, TNT, and perchlorate
	Areas with no historical source and with limited or no current munitions usage.	None
Impact Areas	The eastern dudded impact area, as well as a smaller known dudded area related to historical munitions usage within what is currently used as a non-dudded impact area	2,4-DNT, 2,6-DNT, HMX, PETN, RDX, TNT, and perchlorate

The MCOC listed in **Table 2-2** are potentially present in source media, including soil (*e.g.*, impact berms, localized impact areas surrounding targets, burn pits) and surface water/sediment (*e.g.*, via direct deposition into streams and/or wetlands).

MCOC can be released to groundwater (downgradient), surface water/sediment (downstream), or the food chain via a variety of release mechanisms. Release mechanisms for soil may include leaching from soil to groundwater or erosion and runoff to nearby surface soil or streams. Once potential MCOC are deposited in surface water/sediment, they can migrate downstream or be taken up by aquatic plants or animals.

Release mechanisms that enable transport of potential MCOC from soil or surface water/sediment source areas toward off-range receptors are present in the operational range areas at Fort Jackson and McCrady Training Center. Both surface water and groundwater pathways were identified for soil sources in the live-fire ranges and the impact areas at Fort Jackson and McCrady Training Center.

The surface water system provides migration pathways and contact opportunities between MCOC source areas and off-range human and ecological receptors. Some of the downgradient lakes and streams are within sensitive environments, such as state or local parks or protected rivers. These water bodies are used recreationally by human receptors and as potential habitat for ecological receptors.

Distribution infrastructure for a municipal supply associated with the city of Columbia supplies many of the homes located south of the installation to the west of Weston Lake. South and east of Weston Lake, groundwater is a primary source of drinking water for dozens of residents located to the south and southeast of Fort Jackson and McCrady Training Center. Regional investigations of the Middendorf Aquifer, as well as local topography, indicate that groundwater infiltrating operational range area may flow to the south and southeast towards these residential wells.

The CSM was refined during the initial stages of the Phase II as described in **Section 3**.

3 ORA Phase II

As described in **Section 1**, the strategy for conducting the Phase II was based on the USEPA systematic planning or DQO process. The DQO process provides an iterative sequence of seven logical steps to create a detailed technical approach. The preliminary CSM was developed during the Phase I (Step 1 of the DQO process) and updated during the Phase II planning. The subsequent steps in the DQO process include the following:

- Identifying the goal of the Phase II (the "if-then" statements to determine whether surface water and groundwater pathways are present)
- Identifying information inputs (media to be sampled and analytical methods)
- Defining the study boundaries (which waterways will be sampled depending on the pathways and receptors present)
- Developing the analytical approach (how the data will be analyzed)
- Specifying performance or acceptance criteria (*i.e.*, project action limits [PALs])
- Developing the detailed plan for obtaining data (developing the detailed CSM and technical approach)

The following sections describe the major outputs of the site-specific application of the DQO process, including the updated CSM and the detailed technical approach developed for the Phase II.

3.1 Phase II Site Reconnaissance

3.1.1 Technical Project Planning Meeting and Initial Site Visit (September 2008)

During the Technical Project Planning meeting on 24 September 2008, ARCADIS team members defined the program objectives, programmatic overview, requested support from Fort Jackson and McCrady Training Center, and presented a proposed schedule.

It was during this initial meeting that the idea of completing a combined assessment for both Fort Jackson and McCrady Training Center was first proposed as the installations are adjoining, the property is "owned by" Fort Jackson, they have similar histories of use, and they have similar conceptual site models.

3.1.2 Additional Scoping Meeting & Site Reconnaissance (October 2008)

A meeting took place on 27 October 2008 to coordinate the Phase II Assessment for Fort Jackson and McCrady Training Center. Reconnaissance of proposed surface water and groundwater sampling locations occurred following the meeting on 27 October 2008 and on 28 October 2008. Data collection at both installations also occurred concurrently with the reconnaissance effort.

At the meeting it was decided that the assessments of Fort Jackson and McCrady Training Center would occur together. As such, sampling along the boundary between Fort Jackson and McCrady Training Center was not needed. Based on the reconnaissance observations, some of the proposed upstream and downstream surface water sampling points were relocated. The team agreed that samples collected from Weston Lake would be analyzed only for chemical constituents and no macroinvertebrates. Some of the proposed up gradient and down gradient

groundwater well locations were relocated based on reconnaissance observations. The project team also decided that a piezometer study would be implemented to obtain sufficient groundwater data to develop an understanding of localized groundwater flow. The general consensus among the team was that the piezometer study would be instrumental in subsequently siting groundwater wells.

3.1.3 Final Site Reconnaissance (February 2009)

ARCADIS conducted a pre-investigation site visit at Fort Jackson and McCrady Training Center on 18 through 20 February 2009. During the site visit, the project team gathered previously unavailable data from Fort Jackson and McCrady Training Center, confirmed access to each of the proposed piezometer and surface water sampling locations with Range Operations, met with the drilling subcontractors to confirm drill rig accessibility at each of the proposed piezometer locations, and discussed sampling program logistics. The project team obtained newly collected data associated with recent drilling and surface water sampling activities at the installations. The field team visited the hydrology department at the SCDNR to obtain copies of well logs for wells located on and surrounding the installations.

On 19 February 2009, the field team met with drilling subcontractors and visited proposed piezometer locations to verify accessibility and identify any safety issues associated with the locations. Most of the locations were determined to be accessible by the drillers although three of the piezometer locations (P-11, P-13, and P-15) were determined to require a minimal amount of site work (surface grading) to gain access to the locations.

The team visited proposed surface water sampling locations to confirm accessibility and verify logistics associated with collecting samples. The field team also confirmed Fort Jackson Morale, Welfare, and Recreation would provide a boat for use in sampling activities on Weston Lake.

3.1.4 Post 2009 Assessment Scoping Discussions

Following the completion of Phase II Assessment field activities in 2009 and evaluation of the data generated, numerous discussions were held to discuss the results. Based upon these discussions, the results of the 2009 field activities were deemed to be inconclusive for explosives in groundwater and for metals (primarily copper, lead, tungsten, and zinc) in the Gills Creek watershed. Therefore, the project team decided to prepare a SLERA to further evaluate potential risks associated with the metals MCOC in the Gills Creek watershed, and to perform another phase of field work to obtain additional data to evaluate explosives in groundwater. Additionally, newly available information indicated that depleted uranium (DU) containing munitions were historically utilized at Fort Jackson. As such, uranium (U) and U-isotopes were added to the list of MCOC to evaluate in groundwater. The project team agreed that field activities completed in 2012 would consist of installing well pairs at six locations downgradient of identified potential source areas. The wells would be sampled for explosives, U and U-isotopes.

3.2 Conceptual Site Model

The updated CSMs for the *Inconclusive* areas are summarized in the following sections. Differences in potential MCOC sources, pathways, and receptor locations dictated that Fort Jackson and McCrady Training Center be divided into three separate Phase II assessment areas (Cedar, Colonels, and Gills Creeks) based on watershed divides as shown on **Figure 3-1** and

discussed in the sections below. For the groundwater assessment, a "worst-case" approach was utilized. The groundwater assessment focused on a heavily utilized impact area straddling the Cedar Creek and Colonels Creek watersheds along the combined southern installation boundary.

3.2.1 Primary Sources and MCOC

The potential MCOC considered for analysis in the Phase II are based on the types of munitions used (current and historical) on the *Inconclusive* ranges, as identified in the Phase I. However, potential MCOC identified in the Phase I were revised based on an analysis of more recent information gathered during the site surveys as part of the Phase II. The specific MCOC that were investigated for each potential pathway (surface water system and groundwater system) during the Phase II are outlined below.

3.2.1.1 Surface Water

- Explosives (2,4–DNT, 2,6–DNT, HMX, NG, RDX, and TNT), perchlorate, and metals (Pb, Sb, Cu, Zn, and W) at all sample locations in each watershed.

3.2.1.2 Sediment

- Explosives (2,4–DNT, 2,6–DNT, HMX, NG, RDX, and TNT) and metals (Pb, Sb, Cu, Zn, and W) at all sample locations in each watershed.

3.2.1.3 Groundwater

- Explosives (2,4–DNT, 2,6–DNT, HMX, NG, RDX, and TNT), perchlorate, and metals (Sb, Cu, Pb, W, and Zn) at each sampling point. In 2012, U and U isotopes were added to the list of MCOC.

Based on the findings of the WP study (USACE, 1993), WP was considered unlikely to migrate off-range at concentrations that may pose an unacceptable risk to off-range ecological or human receptors. As such, WP was removed from the list of MCOC to be analyzed for as part of the Phase II assessment.

3.2.2 Pathway Analysis

3.2.2.1 Surface Water Pathways

The surface water system provides migration pathways and contact opportunities between sources and off-range human and ecological receptors. The surface water pathways that receive runoff and/or groundwater discharge from *Inconclusive* ranges include Colonel Creek Watershed, Cedar Creek Watershed, Gills Creek Watershed, and Mill Creek Watershed (**Figure 2-5**).

3.2.2.1.1 **Cedar Creek Watershed**

The surface water source-pathway-receptor CSM for the Cedar Creek watershed is presented on **Figure 3-2**. Potential sources of MCOC in the Gills Creek watershed consist of *Inconclusive* small, medium, and large caliber munitions ranges, and the MCOC include explosives, perchlorate, and MCOC metals. The *Inconclusive* areas are drained by Cedar Creek and its tributaries, which originate on the operational range areas. Potential downstream human receptors include the recreational users of Weston Lake and that portion of Cedar Creek located

south of the outfall of Weston Lake. Potential ecological receptors include the sensitive wetland habitats downstream of operational areas and threatened and endangered species which may use surface water during part of their life-cycle.

3.2.2.1.2 **Colonels Creek Watershed**

The surface water source-pathway-receptor CSM for the Colonels Creek watershed is presented on **Figure 3-3**. Potential sources of MCOC in the Colonels Creek watershed consist of *Inconclusive* small, medium, and large caliber munitions ranges, and the MCOC include explosives, perchlorate, and metals. The *Inconclusive* areas are drained by Colonels Creek and its tributaries, which originate on the operational range areas. Potential downstream human receptors include the recreational users of Colonels Creek. Potential ecological receptors include the sensitive wetland habitats downstream of operational areas and threatened and endangered species which may use surface water during part of their life-cycle.

3.2.2.1.3 **Gills Creek Watershed**

The surface water source-pathway-receptor CSM for the Gills Creek watershed is presented on **Figure 3-4**. Potential sources of MCOC in the Gills Creek watershed consist of *Inconclusive* small, medium, and large caliber munitions ranges, and the MCOC include explosives, perchlorate, and MCOC metals. The *Inconclusive* areas are drained by Gills Creek and its tributaries, which originate on the operational range areas. Potential downstream human receptors include the recreational users of Gills Creek and Boyden Arbor Pond. According to Fort Jackson Family and Morale, Welfare and Recreation division, this recreational use includes fishing. Potential ecological receptors include the sensitive wetland habitats downstream of operational areas and threatened and endangered species which may use surface water during part of their life-cycle.

3.2.2.1.4 **Mill Creek Watershed**

The Mill Creek Watershed drains a small portion of the southwestern corner of the operational range footprint within Fort Jackson along the southern installation boundary. According to RFMSS data and interviews conducted with installation personnel, these ranges have not been utilized for live-fire training since at least the 1960's. Potential historical sources of MCOC were identified at the areas historically utilized as firing points. Because of the small areas covered by the firing points and the likelihood that the sources of MCOC within the watershed are limited, it was determined that the source, pathway, and receptor conditions in the Mill Creek watershed could be adequately characterized by sampling planned for the other three watersheds. Due to similar source, pathway, and receptor characteristics, the Cedar Creek watershed was chosen as the primary proxy for the Mill Creek surface water system in the Phase II Assessment.

3.2.2.2 Groundwater Pathway

Precipitation falling on ranges at Fort Jackson and McCrady Training Center may infiltrate through the vadose zone and enter the groundwater system. The majority of groundwater recharging the Middendorf aquifer is expected to remain within the shallow and intermediate flow system and ultimately discharge to local streams and rivers. Within the Gills Creek watershed this means that water will likely discharge to Gills Creek before leaving the installation. This is similarly true for much of the operational range area lying within the Cedar Creek and Colonels Creek watersheds. However, the topography within the central and western

portions of the combined installation is much more variable with topographically higher hills dissected by streams creating deeper valleys (**Figure 2-3**). Precipitation that infiltrates these higher areas farther from adjoining streams is more likely to enter the intermediate or deeper flow system and bypass lower order streams, especially during the dry season. The intermediate and deeper flow system ultimately discharges to larger order streams to the south and southwest of the installation (**Figure 2-4**).

The area south of the southern installation boundary is generally considered to be hydraulically downgradient of most of the combined installations. For the area located west of Weston Lake, groundwater is unlikely to be utilized for drinking water purposes because the area is connected to a municipal supply system (**Figure 2-3**). Well logs obtained from Fort Jackson and the SCDNR indicate that the aquifers to the south and southeast of the installations are utilized for drinking water. Numerous groundwater supply wells are utilized to supply recreational facilities at Weston Lake. Additionally, numerous residential drinking water wells and larger supply wells were identified in the area south of the combined installations and to the east of Weston Lake (**Figure 2-3**). During a windshield survey completed in the area, dozens of additional wells not included in the database obtained from the SCDNR were also observed. Although no information is available for these wells, they are likely utilized for residential drinking water supply, similar to the wells included in the database. Detailed review of the available wells logs in the area directly to the south of Fort Jackson and McCrady Training Center and east of Weston Lake indicates that the overwhelming majority of wells screened within the Middendorf Aquifer are screened above elevations of 175 feet above mean sea level. This is particularly true for wells located within one to two miles of the installation boundary. A CSM for the groundwater pathway is included as **Figure 3-5**.

Slug tests were completed as part of a previous investigation at two solid waste management unit sites near the installation boundary (Law Engineering and Environmental Services, 2003). The slug tests were used to measure hydraulic conductivities (K values) within the upper portion of the Middendorf Formation. Using these K values, approximate travel times from source areas to the installation boundary could be calculated. Horizontal flow velocities using these K values and hydraulic gradients measured near the installation boundary varied from 34 to 368 feet per year. Although the wells utilized to obtain the hydraulic conductivity data are shallower than many of the residential wells located down gradient, these values are typical for the sediments and conditions found deeper in the aquifer as well (Freeze and Cherry, 1979). As such, the K values and flow rates likely represent reasonable estimates of aquifer properties within the investigation area deeper in the aquifer. Given these flow velocities, water infiltrating heavily utilized ranges near the southern combined installation boundary could reach nearby human receptors in as little as seven years.

3.3 ORA Phase II Technical Approach

As identified during the DQO process and outlined in the *Final Work Plan Operational Range Assessment Program Phase II Quantitative Assessment, United States Army Garrison Fort Jackson and McCrady Training Center, South Carolina* (Malcolm Pirnie, 2009), the appended

Quality Assurance Project Plan (herein referred to as the QAPP)[5], and a subsequent addendum to the QAPP (PIKA-Pirnie JV, 2012), the project goal for the Phase II was to determine whether MCOC potentially present in the groundwater and surface water systems are migrating off-range at concentrations that could pose an unacceptable risk to off-range human and/or ecological receptors. The Phase II was designed to gather data to quantitatively assess the surface water and groundwater pathways to address the goals of the study for the selected assessment areas.

The questions addressed by the Phase II are:

- 1a. Are MCOC migrating from the assessment areas to an off-range area via the surface water system?
- 1b. If so, does the surface water system release pose an unacceptable risk to human or ecological receptors?
- 2a. Are MCOC migrating from the assessment areas to downgradient off-range areas via the groundwater system?
- 2b. If so, does the groundwater system release pose an unacceptable risk to human receptors?

The Phase II used a weight-of-evidence approach to determine whether there is an unacceptable risk to off-range human and/or ecological receptors due to potential on-range MCOC sources. It included assessing the surface water system (surface water, sediment, and benthic macroinvertebrate samples were collected and analyzed) and groundwater system for pertinent MCOC to characterize conditions for three watersheds and one groundwater assessment area.

For the surface water system, sampling locations were selected in upstream and downstream sections of Cedar, Gills, and Colonels Creek watersheds. The upstream sampling locations provided a reference point upstream of the operational range areas identified as *Inconclusive* in the Phase I assessment. The downstream sampling locations were selected to allow evaluation of potential MCOC migration off range via a surface water pathway. Surface water, sediment, and benthic macroinvertebrate sampling was performed on a watershed-by-watershed basis, as explained in the subsections that follow. Surface water system sampling locations are shown on **Figure 3-6**.

Five surface water system sampling events were conducted as part of the initial sampling approach:

- Wet A from 30 March to 6 April 2009; surface water and sediment samples collected
- Wet B from 2 to 7 April 2009; surface water samples collected
- Storm event (dry season) on 18 May 2009; surface water samples collected
- Dry A from 20 to 22 July 2009; surface water and sediment samples collected
- Dry B from 21 to 22 July 2009; sediment samples collected

[5] The QAPP was based in part on the USAIPH *Army Operational Range Assessment Phase II Investigation Protocol* (USACHPPM, 2009). It should be noted that USAIPH was formerly USACHPPM.

For groundwater, a "worst-case" scenario groundwater assessment area was selected. The areas from which samples were collected were biased down gradient from ranges that represent a "worst-case" scenario for MCOC presence and transport to receptors based on historical and current range use and munitions loading, as well as proximity to the installation boundary and groundwater receptors. The potential source area identified as the "worst-case" is shown on **Figure 3-7** and will subsequently be referred to as the groundwater assessment area. These ranges represent a potentially significant source of MCOC (explosives and metals) and are located near enough to the installation boundary that the potential for off-site migration of MCOC via groundwater and/or surface water was identified in the Phase I assessment.

In order to develop an understanding of groundwater flow directions downgradient of the groundwater assessment area, a series of piezometers were initially installed to obtain water table elevations for the unconfined portion of the aquifer (**Figure 3-8**). Using groundwater flow directions interpreted from these elevations, soil borings were advanced to collect groundwater samples from temporary wells installed at intervals separated vertically within the aquifer. These data were collected from May to June 2009. The soil boring locations from which groundwater samples were collected from temporary wells along with other locations sampled in 2009 are shown on **Figure 3-9**.

Based on the results of the 2009 work, a series of six monitoring well clusters (each cluster contains two wells) were installed downgradient of the groundwater assessment area as shown on **Figure 3-10**. These well clusters were sampled three times (July and October 2012 and February 2013) in order to identify any spatial or temporal variations in the concentrations of targeted MCOC.

The analytical data from the surface water and groundwater assessments were used to evaluate potential off-range impacts to human and ecological receptors. Details of the sampling and analysis methodology are presented in **Sections 4** and **5**, respectively. Details of the DQO planning process and the sampling and analysis methods can be found in the *QAPP* and *QAPP Addendum* developed for the Phase II (Malcolm Pirnie, 2009 and PIKA-Pirnie JV, 2012).

The QAPPs are based on procedures outlined in the USAIPH Army Operational Range Assessment Phase II Investigation Protocol (USACHPPM, 2009) and the USEPA Guidance on Systematic Planning Using the Data Quality Objective Process (USEPA, 2006a). QAPP Worksheet #11 contains the planning process statements used to develop the technical approach, while QAPP Worksheet #17 documents the sampling design and rationale.

3.3.1 Surface Water System

3.3.1.1 Surface Water

Surface water samples were collected at eight locations on the installation (**Figure 3-6**) from three separate watersheds. Potential seasonal variations in water quality were evaluated by sampling during both dry and wet seasons. Twenty-four hour composite samples were collected to capture diurnal variations and 2-hour composite samples were collected to characterize potential migration during a storm event in the dry season. Water column composite samples were collected from Weston Lake. All surface water samples were analyzed for explosives MCOC (2,4-DNT, 2,6-DNT HMX, RDX, TNT; plus nine other explosives constituents),

perchlorate, and dissolved MCOC metals (Sb, Cu, Pb, W, and Zn). A more detailed description of sampling activities is provided in **Section 4**. Photographs that detail sampling activities are located in **Appendix A**. Surface water sampling locations within each of the watersheds are described below.

3.3.1.1.1 Cedar Creek Watershed

This watershed includes portions of Cedar Creek and tributaries originating on range and within the main impact area on Fort Jackson. Cedar Creek was dammed to form Weston Lake which the creek now discharges to (**Figure 3-6**). Sampling locations include:

- North branch of Weston Lake (WL1) – lake sampling location located downstream of firing ranges and dudded impact area.
- East branch of Weston Lake (WL2) – lake sampling location located downstream of firing ranges and dudded impact area.

No suitable upstream reference sample locations were available in the Cedar Creek watershed; consequently, the upstream sample locations in the Colonels Creek watershed were used as reference locations for the Cedar Creek downstream locations in Weston Lake.

3.3.1.1.2 Colonels Creek Watershed

This watershed drains almost the entire eastern half of the combined installation and includes live-fire ranges and numerous ranges used historically. Sampling locations include:

- Colonels Creek (CC1) – The location was selected as a reference location upstream of potential source areas.
- Colonels Creek (CC2) – The location was selected as a reference location upstream of potential source areas and upstream of McCrady Training Center.
- Colonels Creek (CC3) – Downstream location within the operational range boundary draining more than half of the combined operational range area.
- Jumping Run Creek (Tributary to Colonels Creek) (JC1) – Downstream location within the operational range boundary draining live-fire ranges and current and historic impact area. Stream also received groundwater discharge from water infiltrating within the impact area.

No suitable upstream reference sample location was available on Jumping Run Creek; consequently, the upstream locations in the Colonels Creek watershed were used as reference locations for the Jumping Run Creek downstream location.

3.3.1.1.3 Gills Creek Watershed

The Gills Creek watershed drains the northwestern portion of the combined installation and includes live-fire ranges, the majority of the small arms ranges on the installations, and a non-dudded impact area, as well as numerous ranges used historically. Sampling locations include:

- Gills Creek (GC1) – The location was selected as a reference location upstream of potential source areas.

- Gills Creek (GC2) – Downstream location draining a primarily non-dudded impact area and many of the small arms ranges located on Fort Jackson, located within the operational range boundary.

3.3.1.2 Sediment

Sediment samples were collected from each of the eight locations from which surface water was sampled as detailed below.

- Two locations in Weston Lake in the Cedar Creek watershed (WL1 and WL2)
- Four locations in the Colonels Creek watershed including:
  - Three locations in Colonels Creek (CC1, CC2, and CC3)
  - One location in Jumping Run Creek (JC1)
- Two locations in Gills Creek within the Gills Creek watershed: GC1 and GC2

Sediment samples were collected during the Wet A event from 30 March to 6 April 2009, the Dry A event from 20 to 22 July 2009, and the Dry B event from 21 to 22 July, 2009. The dates overlap for sampling during the Dry A and Dry B events because on 21 and 22 July, Dry A event samples were being collected in one watershed while Dry B samples were being collected in a different watershed. No sediment samples from Dry A and Dry B were collected on the same day in the same watershed. All sediment samples were analyzed for explosives MCOC (2,4-DNT, 2,6-DNT HMX, RDX, TNT; plus nine other explosives constituents) and MCOC metals (Sb, Cu, Pb, W, and Zn). A more detailed description of sampling activities is provided in **Section 4**. Photographs that detail sampling activities are located in **Appendix A**.

3.3.1.3 Benthic Macroinvertebrate Sampling

Benthic macroinvertebrate samples were collected at four locations in the Colonels Creek watershed: CC1, CC2, CC3, and JC1 in accordance with the QAPP. Benthic macroinvertebrate samples were not collected within the Gills or Cedar Creeks because habitat conditions at the sampling locations selected were deemed unsuitable for benthic macroinvertebrate sampling.

For the Colonels Creek watershed, the benthic macroinvertebrate samples were collected from the four locations during two sampling events: Wet A and Dry A. Three replicate samples were collected at each sampling location during each event for a total of 24 benthic macroinvertebrate samples. A detailed description of benthic macroinvertebrate sample collection procedures is included in **Section 4**. Benthic macroinvertebrate samples were submitted to the Department of Forestry and Natural Resources, Clemson University, Clemson, South Carolina, for population index evaluation as discussed in **Section 5**.

3.3.2 Groundwater System

Due to the size of the combined installations, and in an effort to provide a cost-effective approach, a "worst-case" groundwater assessment area was established to focus the investigation. This area is located in the eastern half of the East Impact Area at Fort Jackson (see **Figure 3-7**) with field activities largely taking place on McCrady Training Center. This impact area has been used heavily for several decades and has received live fire from many munitions

types; thus, it represents a potentially significant source of all of the MCOC identified during the Phase I assessments. Aerial photographs reviewed during preparation of the groundwater approach show that portions of the impact area located near the southern combined installation boundary are heavily cratered and devoid of trees. The areas are also located close enough to the installation boundary and potential human receptors, for transport of MCOC in groundwater to receptor locations to be potentially viable. This area was also selected because it is one of the more accessible areas of the installation. The southern and eastern boundaries of the impact area may be accessed by improved roads without adversely affecting training activities.

The eastern shore of Weston Lake and the east bank of Cedar Creek (**Figure 3-7**), which flows into the northernmost point of the lake, define the western limit of the groundwater assessment area. Together, the stream and Weston Lake provide a boundary to MCOC movement either as a discharge point (the stream and portions of the lake) or as an area where artificially elevated groundwater levels (elevated by the impoundment or losing stretches of stream) may drive groundwater flow locally to the east. The northern, eastern, and southern boundaries of the groundwater assessment area are defined by the limits of the impact area. Much of the groundwater assessment area consists of a north-south trending ridge with the ground surface and likely the groundwater table, sloping from the center of the eastern half of the impact area (and also the groundwater assessment area) to the southwest toward Weston Lake and Cedar Creek and to the south and southeast toward the installation boundary. Additionally, the regional groundwater flow system underlying Fort Jackson and McCrady Training Center flows to the south and southeast (**Figure 2-4**), discharging to the Congaree and Wateree rivers, respectively.

3.3.2.1 Groundwater Assessment Approach

3.3.2.1.1 **2009 Assessment**

The groundwater assessment was initially designed to proceed in two stages to be completed in 2009. During the first stage, piezometers and staff gauge / piezometer pairs were placed to determine the localized groundwater flow direction along the western, southern, and eastern boundaries of the groundwater assessment area. The placement of the piezometers and staff gauge / piezometer pairs was based on interpreted likely shallow groundwater flow directions near the groundwater assessment area, reported regional groundwater flow directions for the greater area, the locations of known human and ecological receptors to the south of the installation, and predominant flow directions estimated based on the existing groundwater CSM. As part of defining groundwater flow directions downgradient of the groundwater assessment area, five staff gauge/shallow piezometer pairs (SG/P-1 and SG/P-3 through SG/P-6) and seven deeper piezometers (P-2, P-7, P-8, and P-10 through P-13) were installed (**Figure 3-8**).

The second stage of the 2009 investigation used the groundwater elevation data and interpreted flow directions obtained from the piezometers to locate groundwater sampling locations down gradient of interpreted potential source areas within the groundwater assessment area. Due to the spatial distribution of potential receptors surrounding the installation (dozens of wells appear to be present downgradient of the installation with the available records indicating that the screened intervals of residential well screens located to the south of the installation generally vary from 315 to 175 feet above mean sea level), depth-discrete groundwater samples from soil borings were needed to meet study objectives. Five soil borings were drilled (locations SB-2 through SB-6 shown on **Figure 3-9**) and depth-discrete water samples were collected at approximately 20

foot intervals starting at the water table and extending to elevations of 150 feet above mean sea level (AMSL), or approximately 25 feet below the deepest residential wells in the area. Appropriately located piezometers and on-installation supply wells were also sampled (**Figure 3-9**). All samples were analyzed for MCOC and other selected parameters.

3.3.2.1.2 **Supplementary Sampling (2012 and 2013)**

As discussed in Section 3.1.4, based upon the results of the depth-discrete groundwater sampling, a third phase of the groundwater assessment was performed in 2012 and 2013. Six well clusters (two wells per cluster) were installed downgradient of the groundwater assessment area to provide additional groundwater sampling data for targeted MCOC (**Figure 3-10**). Samples were collected at approximately four month intervals over the course of a year to identify temporal variations in groundwater chemistry. The spacing of the wells and the installation of a shallow and deep well at each cluster location was designed to identify horizontal and vertical variations in groundwater chemistry near the downgradient range boundary. During development of the technical approach for this phase of assessment, DU-containing munitions were identified as being utilized at Fort Jackson. Therefore, U and U-isotopes were added to the MCOC list.

3.3.3 PALs

PALs for surface water, sediment, and groundwater were established for the potential MCOC. For Fort Jackson and McCrady Training Center, PALs are based on the lower of either the DoD Range and Munitions Use Subcommittee (RMUS) 2012 Operational Range Assessment Screening Values Version 6.0, updated 21 May 2012 (DoD, 2012), or the South Carolina Department of Health and Environmental Control (SCDHEC) *R.61-68, Water Classifications & Standards* (22 June 2012).

For metals in surface water, the ORA and SCDHEC ecological criteria are identical. For surface water and sediment, the ORA screening values (both human and ecological) for explosives MCOC are lower and so are utilized as the PALs.

The ORA screening values for freshwater ecological acute and chronic toxicity of Cu, Pb, and Zn are adjusted by a formula and are inversely proportional to the measured hardness concentration[6]. Therefore, hardness concentrations were measured to calculate screening criteria for those metals with hardness-dependent criteria in surface water. The single lowest hardness value determined in either primary or duplicate samples collected at a given watershed during a given sampling event was conservatively used to calculate event-specific hardness-dependent PALs except where measured hardness values were below 25 milligrams per liter (mg/L) $CaCO_3$ in which case hardness dependent PALs were calculated based on a value of 25 mg/L $CaCO_3$. All measured surface water hardness values were below 25 mg/L $CaCO_3$. The surface water event/assessment area-specific PALs are listed in **Table 3-2**. MCOC concentrations detected in storm event samples were compared to the respective acute screening value. MCOC

[6] A relative increase in hardness will lower the ecological toxicity of Cu, Pb, and Zn in surface water resulting in an increase in the ecological risk screening criteria/PAL. The SCDHEC utilizes the same hardness based formulae as the ORA screening values (DoD, 2012) to calculate the ecological risk screening criteria/PAL.

concentrations detected in all other event samples were compared to the respective chronic screening values. Sediment PALs are presented in **Table 3-2**.

For metals, explosives, and perchlorate in groundwater, PALs are based on the lower of either the ORA human drinking water screening levels (DoD, 2012) or the SCDHEC values for human health. For each MCOC listed, the ORA value was either the same or more restrictive than the SDHEC value. Groundwater PALs are included in **Table 3-3**. In addition, for the purposes of the Phase II assessments, the USACHPPM Protocol established estimates of uncertainty that were applied to the screening values rather than the individual datum. Any value falling within this range of uncertainty is questionable with regard to making the conclusion and subsequent decisions. That is, if the data fall within the range of uncertainty, a definitive conclusion that the screening value has, or has not been exceeded, cannot be reached, and further study is recommended. **Table 3-3** lists the Lower Range of Uncertainty (LRU) for the MCOC of interest.

1 **Table 3-1: Watershed and Groundwater CSMs**

2

Watersheds	Potential Source Areas	Potential MCOC*	Surface Water Pathways	Surface Water Receptors	Groundwater Pathways	Groundwater Receptors
Cedar Creek (Weston Lake)	Multipurpose ranges, artillery and mortar firing points, western impact area, demolition sites	Explosives, perchlorate, & MCOC metals	Cedar Creek and tributaries originating on-range and flowing south into Weston Lake	Species of special concern and sensitive environments. Recreational users of Weston Lake	Leaching and infiltration into the Middendorf Aquifer	Users of groundwater from supply wells at Weston Lake and supply wells and residential drinking water wells south of the installations
Colonels Creek	Multipurpose ranges, artillery and mortar firing points and demolition sites	Explosives, perchlorate, & MCOC metals	Colonels Creek and tributaries originating on-range and flowing south off-installation	Species of special concern and sensitive environments. Recreational users of Colonels Creek and Murray Pond	Leaching and infiltration into the Middendorf Aquifer	Users of groundwater from supply wells and residential drinking water wells south of the installations
Gills Creek	Small arms range, western impact area, and non-live-fire training areas	Explosives, perchlorate, & MCOC Metals	Gills Creek and tributaries originating on range flowing off-range and southwest off-installation	Species of special concern and sensitive environments. Recreational users of Gills Creek, Boyden Arbor Pond, Forest Lake, and Lake Katherine	Leaching and infiltration into the Middendorf Aquifer	Users of groundwater from supply wells located between ranges and Gills Creek

* - As identified during Phase I

Table 3-2: Surface Water System PALs

Analyte	Surface Water *(values in µg/L)*						Sediment[a] *(values in mg/kg)*
	Human Health		Ecological Surface Water Screening Criteria[a]		Selected Project Action Limits		
	ORA SV[a]	SC SV [b]	Chronic *(Non-Storm)*	Acute *(Storm)*	Chronic *(Non-Storm)*	Acute *(Storm)*	
Hardness (as mg/L $CaCO_3$)							
Hardness[c]	NA	NA	< 25	< 25	< 25	< 25	--
MCOC Metals							
Sb	6	5.6	30	30	5.6	5.6	12
Cu	620	1,300	2.7	3.6	2.7	3.6	34
Pb	15	--	0.54	14	0.54	14	47
W	--	--	--	--	--	--	--
Zn	4,700	7,400	36	36	36	36	150
Perchlorate							
Perchlorate	15	--	9,300		15		--
Explosives MCOC[d]							
RDX	0.61	--	190		0.61		0.013[e]
DNB	1.5		20		1.5		0.0067[e]

NOTES:

mg/kg = milligrams per kilogram

mg/L = milligrams per liter

µg/L = micrograms per liter

NA = No applicable screening level is available

[a] Human health and ecological screening criteria for metals and explosives MCOC are based on DoD *Operational Range Assessment Screening Values*, Version 6.0 (DoD, 2012) for freshwater.

[b] South Carolina Water Classifications and Standards. SC Regulation § 61-68. (SC, 2012).

[c] Hardness values are not subject to applicable risk screening criteria, but presented as the basis for Cu, Pb, and Zn ecological risk screening criteria, as discussed above.

[d] RDX and DNB were the only explosives MCOC detected in surface water and/or sediment at Fort Jackson and McCrady Training Center. All other explosives PALs can be found in **Appendix B** summary tables.

[e] RDX and DNB sediment screening values shown in table are based on a minimum 1 percent total organic carbon (TOC) concentration. The RDX and DNB sediment screening values for sediments with a higher associated total organic carbon is obtained by multiplying the measured TOC (up to a maximum value of 100 percent) by the sediment PAL value shown to a maximum value of 1.3 mg/kg for RDX and 0.67 mg/kg for DNB.

Tungsten (Total & Filtered)	--	--
Zinc (Total & Filtered)	4,700	2,820
Uranium	30	3.0
Uranium Isotopes	30	3.0

Notes:

[1] Following the hierarchy for human health drinking water screening values in the Army Operational Range Assessment Phase II Investigation Protocol (ORA Protocol) (USACHPPM, 2009), PALs are the current USEPA Regional Screening Values for tap water (dated November 2012) for all MCOC except perchlorate. The PAL for perchlorate is the value listed in the DoD Range and Munitions Use Subcommittee (RMUS) 2012 Operational Range Assessment Screening Values Version 6.0, Updated 21 May 2012 (DoD 2012).

[2] Following the ORA Protocol, LRUs for metals were set at 50% (copper and lead) or 60% (antimony and zinc) of the PALs and LRUs for explosives were set at 1/10th the PALs. The LRU for RDX was set at the limit of quantitation of 0.1 µg/L.

[3] It is important to note that the PAL for RDX is a United States Environmental Protection Agency (USEPA) Integrated Risk Information System screening value and not an enforceable federal standard. A 2.0 µg/L value is listed by the USEPA as a lifetime health advisory level, which is also not an enforceable standard. All RDX concentrations detected downgradient of the groundwater assessment area and other assessment areas were below this lifetime health advisory level.

4 Methodology

Details on the sampling and analytical procedures, along with health and safety plans, are included in the Fort Jackson and McCrady Training Center Work Plan/QAPP (Malcolm Pirnie, 2009a), the appended Accident Prevention Plan (APP), and QAPP Addendum (PIKA-Pirnie JV, 2012). Field activities were conducted in accordance with the QAPP and QAPP Addendum, including the Standard Operating Procedures (SOPs) contained in Appendix B of the QAPP and Attachment 1 of the QAPP Addendum. Safety procedures used during sampling activities were in accordance with the APP.

4.1 Field Methods

The following field method SOPs, detailed in the QAPP and QAPP Addendum, were used for the surface water, sediment, benthic macroinvertebrate, and groundwater sample collection:

- Groundwater Sampling
- Low Stress (Low Flow) Groundwater Sampling
- Standard Operating Procedure for HydraSleeves™
- Monitoring Well Development
- Groundwater Level Measurement
- Field Portable X-Ray Fluorescence (XRF) Spectrometry
- Draft USACHPPM Benthic Macroinvertebrate Sampling SOP
- Excerpt from Methods for Collection, Storage and Manipulation of Sediments for Chemical and Toxicological Analyses: Technical Manual
- Surface Water Sample Collection Using Autonomous Samplers
- Care, Maintenance, and Storage of YSI 6-Series Probes and Sondes
- Method 1669 Sampling Ambient Water for Trace Metals at EPA Water Quality Criteria Levels

Modifications to field procedures potentially affecting data usability or quality required same-day approval from the Team Leader, the Project Manager, and the Project Quality Assurance (QA) Manager. All such modifications were discussed with the appropriate members of the project team and then documented in trip reports following each of the field events. Modifications to the QAPP or QAPP Addendum requiring approval from USACE and ARNG Directorate were secured by the Project Manager.

4.2 Surface Water System Investigation

Table 4-1, at the end of this section, indicates when each sampling event occurred, which locations were sampled, sample collection method (*i.e.*, grab versus composite), and sample type

(*i.e.*, primary sample, duplicate sample, equipment blank, etc.). **Figure 3-6** shows each sample location.

Surface water sampling activities included dry season, wet season, and storm water sampling to evaluate stream conditions under different seasonal conditions. Wet and dry seasons were defined by readily available annual precipitation data and stream flow conditions.

4.2.1 Surface Water Sampling

Composite samples were collected using ISCO brand 6712 series composite autosamplers, which were programmed to collect 96 discrete samples over a 24-hour period for clear weather samples and 20 samples over a 2-hr period for storm samples. In situ field measurements of pH, temperature, DO, turbidity, and specific conductivity were recorded following each sampling event. The composite samples at all surface water sampling locations were contained in 4-liter laboratory-certified clean carboys. Carboys were kept on ice to maintain a temperature of 4 degrees Celsius (°C), plus or minus 2°C, during sampling and until transfer to laboratory-cleaned sampling containers. The field team filtered and collected the samples from each carboy within 48 hours of the start of sample collection. Each sample container was appropriately labeled using indelible ink and secured. Each sample was logged on the chain-of-custody (COC) form with the required analyses. The COC forms are included in **Appendix C**. The samples were placed in ice-filled coolers and each cooler was sealed with the COC inside; custody seals were signed, dated, and placed on opposite corners of the cooler, and the coolers were shipped overnight to the analytical laboratories. **Appendix A** provides photographs of a typical sampling location. Surface water sampling locations are shown on **Figure 3-6**.

In the Gills Creek watershed, an upstream sample was collected at location GC1 and a downstream sample was collected at location GC2. In the Colonels Creek watershed, upstream samples were collected at locations CC1 and CC2, and downstream samples were collected at locations CC3 and JC1 (located in Jumping Run Creek). In the Cedar Creek watershed, downstream samples were collected at WL1 and WL2 (located in Weston Lake). No upstream locations were available in the Cedar Creek watershed or on Jumping Run Creek; consequently, the upstream locations in the Colonels Creek watershed were used as reference locations for the Jumping Run Creek and the Cedar Creek downstream locations. **Table 4-1a** provides a summary of the surface water samples collected as part of this assessment.

Deviations from the planned sampling approach are summarized below:

- Because the level of water in Weston Lake decreased between the Wet A event in March and the Dry A and Dry B events in July, the sampling location for WL2, which was selected during the Wet A event, was not accessible by boat during the Dry A and Dry B events. USAEC and USAPHC personnel overseeing the sampling activities were consulted, and agreed that the sampling location for WL2 should be shifted to the west by approximately 250 feet for the Dry A and B events. While both sampling locations for WL2 (and also WL1) are within the footprint of a site currently being investigated under the Military Munitions Response Program (MMRP), the Dry A and Dry B event's location was closer, and possibly within, the former target area for a small arms range. The Wet A location for WL2 and the wet/dry location for WL1 are located within the former safety fan associated with the small arms range. The Dry A/Dry B location for WL2 is within or close to the target area for the small arms range.

- Surface water samples were intended to be 24-hour time composited with sample aliquots collected every 15 minutes. Some samples (from location CC2 during Wet A and locations CC1, CC2, CC3, and JC1 during Wet B) were collected over 20 hours rather than 24 hours due to autosampler rechargeable battery failure. This deviation from the Work Plan was discussed with USAPHC personnel who provided on-site technical oversight during the sampling events.
- A surface water sample was not collected at CC2 during the Dry A sampling event, as there was no standing or flowing surface water at the time of sampling. The sediment in the creek bed was wet; therefore, a sediment sample was collected from location CC2 during the Dry A event.

None of the deviations are expected to have adversely affected the overall quality of the collected data set.

4.2.2 Sediment Sampling

During the Wet A sampling event, grab samples of sediment were collected at each stream location. To facilitate selection of the sediment sampling locations, an X-50 mobile portable XRF unit was used to field analyze sediment samples for metals (XRF field forms are included in **Appendix D**). The XRF screening was performed to field test the applicability of this screening approach for future Phase II assessments at U.S. Army and ARNG installations. Two or more grab samples were collected at each location, depending on site conditions. Each grab sample was screened with the XRF for MCOC metals. An additional sediment sample was collected in the location that had the highest overall metal concentrations, according to the XRF readings. This grab sample was submitted to the laboratory for analysis. Because there was little variation in metals concentrations for the specific stream locations screened using the XRF during the Wet A sampling event and because the XRF detection limits for the MCOC were significantly higher than the PALs, the XRF screening was determined not to be applicable for the Fort Jackson and McCrady Training Center sediment sampling.

The sediment sampling approach described in the USACHPPM Phase II protocol (2009) was used for the remaining field events. USEPA's *Methods for Collection, Storage and Manipulation of Sediments for Chemical and Toxicological Analyses* (USEPA, 2001) was used as guidance for the selection of the appropriate sampler/sampling technique. During the Dry A and Dry B sampling events, composite samples of sediment were collected at each stream location. Subsamples of sediment were collected across a cross section of the stream, mixed together, and placed in jars for submittal to the analytical laboratory. Disposable scoops and bowl liners were used for each location. Sediment samples collected from Weston Lake were collected using an Ekman bottom grab sampler during all sampling events. The Ekman sampler was scrubbed with an Alconox™ solution and rinsed with distilled water. It was then rinsed with methanol (followed by distilled water) and nitric acid (followed by distilled water). The Ekman sampler was then rinsed with site water (*i.e.*, lake or creek water) prior to use at each sample location. Subsamples were collected from the center of multiple Ekman bottom grab samples and homogenized by mixing until a sufficient quantity was obtained to fill sample jars. **Table 4-1b** provides a summary of the sediment samples collected as part of this assessment.

4.2.3 Benthic Macroinvertebrate Sampling

Benthic macroinvertebrates are considered indicators of ecological system impacts over an extended period of time; consequently, general health of the benthic macroinvertebrate community is only moderately dependent on the time that samples are collected. Benthic macroinvertebrate populations vary with seasonal trends, such as temperature and longer-term rainfall, and according to their natural life cycles. Therefore, grab samples were collected at four of the surface water system sampling locations during the Wet A and Dry A sampling events. The four locations are CC1, CC2, CC3, and JC1 in the Colonels Creek watershed (no sample was collected at location CC2 during the Dry A event because there was no flowing or standing water).

Initially, benthic macroinvertebrate samples also were planned to be collected from the Gills Creek watershed. However, as noted in the Work Plan, after performing a site reconnaissance, habitat conditions at the two surface water locations selected in Gills Creek (GC1 and GC2) were deemed unsuitable for benthic macroinvertebrate sampling. While GC1 (upstream) was representative of a stream habitat with a clearly defined channel and higher flow rates, GC2 is located in an area where Gills Creek widens at the headwaters of Boyden Arbor Pond and the habitat is more typical of wetlands. The difference in habitats was deemed to be substantial enough that a comparison of results could not be used reliably to determine if benthic macroinvertebrate health was degraded between the upstream and downstream locations. No benthic macroinvertebrate samples were collected from the Cedar Creek watershed because the sampling locations are in Weston Lake and, thus, could not be compared to the upstream Colonels Creek sampling locations.

The benthic macroinvertebrate sample collection and analysis activities followed the Benthic Macroinvertebrate Sampling Standard Operating Procedure as outlined in the USACHPPM Phase II protocol (2009). All samples were collected by the same two-person team consisting of an aquatic biologist and an environmental scientist. The team collected samples using D-frame dip nets as outlined in the USACHPPM Phase II protocol (2009). At each location, subsamples were collected from all habitat types present (*e.g.*, sandy bottom), sieved with a U.S. Standard #30 sieve, composited, and field preserved with 80% ethanol. To the extent practical, the team sampled like habitats and used similar sampling practices at each location. The aquatic biologist visually inspected the samples to ensure collection of 100 organisms per replicate sample as recommended in the USACHPPM Phase II protocol (2009). Samples were transported by ARCADIS employees to the Department of Forestry and Natural Resources Laboratory at Clemson University under proper COC procedures. **Table 4-1c** provides a summary of the benthic macroinvertebrate samples collected as part of this assessment.

4.3 Groundwater System Assessment

Site activities completed as part of the groundwater system assessment included installation of staff gauge/piezometer pairs, installation of piezometers, measurement of groundwater elevations, collection of depth-discrete groundwater samples from temporary wells, installation of well clusters (with shallow and deep wells), and collection of groundwater samples from the well clusters. Procedures utilized in the field generally followed those outlined in the QAPP and QAPP addendum (Malcolm Pirnie, 2009 and PIKA-Pirnie JV, 2012) except where changes are discussed below.

4.3.1 Piezometer and Staff Gauge Installation Procedures

Staff gauge and piezometer pairs were installed using hand augers at locations identified on **Figure 3-8**. Each of six staff gauges was installed adjacent to an associated piezometer and consisted of a metal fence post driven into a stream bottom or lake bottom. A 1-inch diameter perforated polyvinyl chloride (PVC) pipe was attached to the fence post to create a fixed, protected measurement point, unaffected by stream flow or wave action. The top of the PVC pipe elevation was surveyed and used as the measurement point for the surface water elevation at that location. The adjacent piezometers (P-1 to P-6) were installed by hand augering to saturated soils to install a water table piezometer. A 1-foot well screen attached to a 1-inch-diameter PVC pipe was installed in the hand augered hole at a depth intended to intercept the water table. The annular space surrounding each well point was backfilled with clean silica sand, 6 inches to 1 foot above the screen. The remaining annular space was backfilled with bentonite chips to the ground surface. **Figure 4-1** illustrates the general staff gauge / piezometer pair construction.

Piezometers P-7 and P-8 were installed using direct-push technology and hollow-stem auger drilling methods. Piezometers P-10 through P-13 were installed using Rotosonic drilling procedures due to the greater depths to groundwater at these locations. Piezometer P-10 was moved slightly at the request of the installation as the initially identified location was located adjacent to a heavily utilized access road. Piezometer P-14 was not installed because, although Range Operations initially indicated that the area was readily accessible, the location was subsequently identified to be in a surface danger zone for a heavily utilized firing range. The on-site project geologist logged the physical characteristics of the soil using visual and manual observations according to the Unified Soil Classification System, depth to groundwater, and other notable conditions on the test boring log for each piezometer. Test boring logs for each of the stand-alone piezometers are included in **Appendix E.**

The seven stand-alone piezometers were completed using standard well installation techniques. All piezometers were constructed of 2-inch inside diameter, flush joint, Schedule 40 PVC, with 0.010-inch slotted screen varying from 5 to 15 feet in length. Screen lengths were chosen based on lithological conditions and depths to groundwater. The intent was to straddle the water table with enough unsaturated screen length to accommodate potential fluctuations in the water table. At the time of the investigation, installation personnel reported that the water table was approximately 7 feet lower than average due to drought conditions occurring in the region. As a result, several piezometers were installed with 15-foot screen lengths to accommodate fluctuations in the water table. A silica sand filter pack was placed to approximately 2 feet above the top of the screened interval. A minimum 2-foot-thick bentonite chip or powdered bentonite seal was placed above the sand pack to prevent the downward infiltration of shallow groundwater or surface water. The remainder of the boring annulus was filled with cement/bentonite grout. The piezometers were completed at the surface with 4-inch square, steel protective casing and a 2-foot-by-2-foot concrete pad at the surface. All piezometers were locked with keyed-alike padlocks on the steel protective casings.

All non-dedicated, down-hole drilling equipment was decontaminated on site at a temporary decontamination pad prior to advancement of each boring per the procedures detailed in Section 4.3.8 and in accordance with the project QAPP.

4.3.2 Piezometer and Monitoring Well Development

The newly installed piezometers were developed to flush the well and sand pack of fine sediments. The development process is intended to create wells that will yield water samples that are representative of the groundwater quality at that location, as well as to provide viable measurement points for groundwater elevations.

The piezometers were developed no sooner than 48 hours after well installation was completed, with the exception of piezometer P-12. P-12 was developed the same day it was completed to assure that training schedules for nearby ranges were not affected by the field activities (*i.e.*, access to P-12 was restricted to only the time periods when the ranges were not actively being used). Development of the piezometers was performed by purging with submersible pumps and/or dedicated disposable bailers. Specific conductivity, temperature, DO, pH/eH, and turbidity were monitored frequently during the development process. Subsequently installed monitoring wells were developed in a similar manner to that described above. Well Development/ Purging Logs are provided in **Appendix E**.

4.3.3 Groundwater Elevation Measurements

Following the installation of the seven piezometers and five staff gauge / piezometer pairs, depth-to-water measurements were determined to the nearest 0.01 foot from the top of the riser using an electronic water level indicator. Following the completion of the site survey, all measured water levels were converted to elevation measurements in units of feet AMSL. Groundwater levels were measured to determine direction of groundwater flow at the piezometers and surface water / groundwater interactions at the staff gauge / piezometer pairs. An equipotential map of the water table was prepared using the calculated groundwater elevations from the measurements recorded on 7 April 2009. These elevations were used to select the boring locations from which depth-discrete groundwater samples would be collected, down gradient of interpreted potential source areas within the groundwater assessment area.

4.3.4 Borehole Drilling and Temporary Well Installation and Sampling Procedures

The second stage of the investigation consisted of collecting depth-discrete groundwater samples at five soil borings (SB-2, SB-3, SB-4, SB-5, and SB-6) as shown on **Figure 3-9**. The five soil borings were advanced to depths ranging from 156 to 214 feet bgs. This corresponds to elevations of approximately 203 to 144 feet AMSL. A total of 26 depth-discrete groundwater samples were collected from the boreholes. Samples were collected starting at the water table and at approximately 20-foot intervals beneath the water table. As indicated in the 2009 QAPP, samples initially were planned to depths roughly equivalent to 150 feet AMSL. However, after collecting stratigraphic data at SB-3, SB-5, and SB-6, which were completed to their approximate targeted depths (148, 147, and 144 feet AMSL, respectively), significant clayey units were interpreted to potentially be laterally persistent near the target boring depths at SB-2 and SB-4. As a result, borings SB-2 and SB-4 were terminated within clay units above the proposed target elevation of 150 feet AMSL (SB-2 and SB-4 were completed at elevations of 202 and 167 feet AMSL, respectively) to avoid penetrating the potential confining unit. The clay units were penetrated near the bottoms of SB-3, SB-5, and SB-6. All of the boreholes, except for SB-3, were abandoned with a cement and bentonite grout mixture tremmied to the bottom of the hole. At SB-3, a monitoring well (MW-RS-1) was installed adjacent to the previously installed

piezometer P-11. This well was set at a depth of 182 feet bgs, and care was taken in choosing the screened interval so that it did not create an avenue for migration between two previously unconnected water bearing units. Measurements from MW-RS-1 and the adjacent piezometer provide information regarding vertical gradients at this location.

The boreholes used for depth-discrete groundwater sampling were advanced using sonic drilling methodology with 6-inch flush-joint threaded casing and 4-inch drill rods (Sonic 4 x 6). The soil cores were collected by advancing a core barrel (approximately 5-inch outer diameter) in 10- or 20-foot continuous runs. Soil cores were collected continuously to the target sample interval. Groundwater samples at each boring location were collected at the water table and at approximately 20-foot intervals beneath the water table, with the actual sample interval selected by the on-site geologist based on lithology and relative permeability. Sample intervals were adjusted to target more productive zones, typically consisting of coarser grained sands, based on visual observations; or to depths just above clay layers or relatively impermeable zones. Some sample intervals were skipped due to the presence of significant thicknesses of clayey soils at the target depth that were significantly less permeable and, therefore, not productive enough to collect a groundwater sample. A groundwater sample was then collected from the next permeable zone encountered. Sampling continued below the less permeable zones as most of the clay units encountered were considered laterally discontinuous. Exceptions to this were the lower clay layers encountered at soil borings SB-2 and SB-4. The more productive zones targeted for sample collection are more likely to transport potential MCOC off range.

Two different methods were used to collect groundwater samples during the 2009 effort: the Pump and Packer method and the Push-Ahead™ Sampler. The Pump and Packer method consists of a 2-inch stainless steel temporary well screen and K-Packer, a rubber gasket at the top of the well screen designed to seal off the inside of the 6-inch drill casing. A 5 to 10 foot long well screen was lowered into the drilling casing to the desired sample interval depth. The casing was then retracted to expose the well screen to the formation. The K-Packer remained inside the casing, sealing off the well screen intake from the water inside the casing, allowing the pump to draw water from the formation. The sampling assembly is shown on **Figure 4-2**.

Since the drilling process required the addition of water to advance the casing, the target sample interval was purged using a submersible pump (Geotech SS Geosub or Mega Monsoon DC pump) prior to collecting the groundwater sample. The quantities of water used during the drilling process to advance the casing to the 20-foot interval above the target sample interval varied from none to as much as 450 gallons. Most intervals required approximately 100 to 250 gallons of water to advance the casing the 20-foot interval. At each depth-discrete sample interval, a submersible pump and new disposable tubing were lowered into the temporary well screen. Purging rates varied from interval to interval and often decreased with depth to less than 1 gallon per minute. At some sample intervals, the purging was supplemented with air-lift methods or a combination of pump and air-lift to increase the purge rate of the selected sample interval. The air-lift method involves injecting compressed air through an air-injection line into the water column. The compressed air forces the water upward through the casing or the air and water discharge tubing consisting of ¾-inch to 1-inch inside diameter black polyethylene tubing. The air-injection line discharge point is set typically 10 to 20 feet above the well screen to prevent any aeration at the well screen or formation. For this investigation, separate air-injection line and discharge tubing were used, where the air-injection line discharge point was fed a

minimum of 2 feet upward into the discharge tubing. The air displaces the water inside the discharge tubing only and does not come into contact with the well screen or surrounding formation, forcing the water out the discharge line. The compressed air was filtered through an activated carbon oil-vapor removal element before injecting into the water column to prevent moisture or oils from the compressor entering the water column. Water quality parameters were measured from the pump discharge line. **Figure 4-2** illustrates the Pump and Packer and air-lift assembly used during this investigation. The air-lift method was considered a viable alternative to assist with purging because the MCOC for this investigation are not particularly sensitive to volatilization and the air-lift system was turned off well before collection of the sample.

The field team also evaluated a Push-Ahead™ sampler to collect groundwater samples as a quicker alternative for collecting groundwater samples. The Push-Ahead™ sampler is driven ahead of the casing into undisturbed soils to the desired sample interval depth. Upon reaching the target depth, a water level indicator is lowered into sampling rods to check for leakage through pipe joints or sampling ports. Once verified as dry, the sampler is opened to allow infiltration of depth-specific formation water into the drilling rods, where the water can be purged with the submersible pump or a bailer. Confirmation of groundwater infiltration was verified with the water level indicator. For this investigation, the Push-Ahead™ sampler was used to collect only one sample at SB-3 and two samples at SB-6. After evaluating the Push-Ahead™ sampler, it was decided that the Pump and Packer method allowed the team to more accurately target permeable intervals for sampling and reduced sample turbidity.

To ensure that the samples collected were representative of the formation at that depth, groundwater was purged from the target sample interval and measured periodically for water quality parameters, including pH, conductivity, temperature, turbidity, and oxidation reduction potential (ORP). During the purging process, water levels inside the 6-inch casing were monitored periodically to verify that the drill casing was sealed off from the temporary well screen intake. These measurements indicated only negligible fluctuations, indicating that the K-packer was functioning properly. Samples were collected after the water quality parameters stabilized as outlined in the project QAPP. The water quality parameters were recorded and are included in **Appendix D.** The quantities of water purged to reach stabilization of water quality parameters often approached, and on occasion exceeded, the quantity of water used to advance the casing the entire 20-foot interval above the target sample depth. This process was considered sufficient since the water introduced to advance the casing was distributed over the length of the 20-foot interval above the target sample depth and not at the target sample depth. All samples were collected directly from the pump and disposable tubing or bailer used for purging once the parameters stabilized. Sample bottles were filled directly from the disposable tubing or bailer. Groundwater samples were collected and submitted to GPL Laboratories in Frederick, Maryland, for the following laboratory analyses:

- Explosives by USACHPPM SOP CAD 13.3
- Perchlorate by USEPA 6850
- Hardness metals (calcium and magnesium) plus sodium by USEPA 200.7
- Total and dissolved metals (Sb, Cu, Pb, Zn, and W) by USEPA 200.8
- Anions (sulfate, chloride, and nitrate) by USEPA 300.0

- Alkalinity by USEPA 310.1/SM2320B
- Total dissolved solids (TDS) by SM2450C.

The samples submitted for dissolved metals and for hardness metals analyses were field filtered using a 0.45-micron high volume cartridge filter. When the field turbidity measurements were less than 10 Nephelometric Turbidity Units (NTUs) prior to sample collection, dissolved metals analysis was not performed. Perchlorate samples, except for the groundwater samples from SB-3, were field filtered using a 0.20-micron high volume cartridge filter as per the DoD perchlorate sampling guidance (2007). The field team inadvertently omitted the perchlorate field filtering when sampling from SB-3. These samples were not filtered at the lab as this process is done to reduce anaerobic microbial degradation during shipping. One of the proposed depth-discrete sampling intervals in SB-6 (106 feet bgs) was not sampled due to the lack of an adequately permeable zone for sample collection. A summary of the depth-discrete samples collected from temporary wells is included in **Table 4-2.**

Groundwater samples were collected from temporary wells at numerous depth-discrete intervals within the aquifer from soil borings SB-2 through SB-6. All groundwater samples were collected during the first sampling event and, therefore, are labeled with the sampling event designation GW1.

All groundwater samples were analyzed for total metals identified as MCOC (Sb, Cu, Pb, W, and Zn), explosives compounds, and perchlorate. For samples where the turbidity measured just prior to sample collection exceeded 10 NTUs, an additional sample was collected and filtered in the field through a 0.45-micron filter with the sample analyzed for dissolved metals. All perchlorate samples were filtered in the field through a 0.20-micron filter except for those collected from SB-3. Analytical data results for groundwater are discussed in **Section 6** of this report.

It is important to note that a monitoring well was installed within the soil boring SB-3. This well, MW-RS-01, was installed in the same manner described above for the piezometers. The well is screened from 177 feet bgs to 182 feet bgs (elevations of 148.1 to 153.1 feet AMSL). The well was developed is a similar manner to that described in Section 4.3.2.

4.3.5 Piezometer and Well Sampling

On 4 June 2009, two of the piezometers (P-1 and P-7) were sampled using USEPA low-flow sampling techniques (1998). Each piezometer was purged and sampled using a peristaltic pump. Attempts were also made to sample piezometers P-2, P-4, and P-5. Each of these locations purged dry almost immediately, with fewer than 500 milliliters of water removed. It was determined in the field that these piezometers would not produce sufficient volume for sample collection, which required approximately 7 liters of water per sample.

The Weston Lake supply well, WL-1, was sampled on 10 June 2009. According to Palmetto State Utility representatives, this well is treated with a chlorination and granular activated carbon system. Samples were filled directly from a hose spigot at the well location, which is located prior to the treatment systems. Depths to water and total depth of the well were also measured and are included on the monitoring well sampling forms in **Appendix D**. A summary of the samples collected from piezometers and the Weston Lake well is included in **Table 4-2**

4.3.6 Monitoring Well Pair Installation

As part of the follow-on work for the Phase II Assessment (see Section 3.1.4), six monitoring well pairs (MW-RS-02 through MW-RS-07) were installed at locations downgradient of potential source zones in the groundwater assessment area (**Figure 3-10**). Well locations were selected based upon the previous detections of RDX in numerous depth-discrete groundwater samples collected from SB-3, groundwater flow directions as interpreted using groundwater elevation data obtained from the previously installed piezometers, and accessibility. The monitoring wells were installed in two rows. The first row of wells (MW-RS-02 through MW-RS-04) was installed to evaluate the groundwater conditions near the suspected source area and the previous location at which RDX was detected. The second row (MW-RS-05 through MW-RS-07) was located downgradient of the first row near the installation boundary along the groundwater flow path. Each location consisted of a set of paired wells (*i.e.*, two screened intervals) installed within one borehole.

The screened intervals for all of the monitoring well pairs were intended to target the elevation range of the previous RDX detections at SB-3 (248 to 195 feet AMSL). The actual elevations of the well screens were chosen based on the initial targeted depth while making accommodation for the lithological conditions encountered. As an example, if a particularly course grained zone likely to have a high hydraulic conductivity was encountered during drilling efforts, that zone was targeted with a well screen placed in that interval. For zones where clay was encountered, the screened interval was set above or below that interval based upon the on-site geologist's interpretation of site conditions. Due to the interbedded nature of the aquifer and the very difficult drilling conditions, sonic-drilling methods were utilized. At each location the soil borings were drilled to the target depth using a 4-inch inside diameter core-barrel which was over-drilled with a 6-inch inside diameter casing to maintain the integrity of the borehole for well construction. Based upon the soil characteristics, the on-site geologist chose a ten-foot interval to set the shallow well screen. The 6-inch casing was then overdrilled to the base of the shallow well screened interval with an 8-inch inside diameter casing. Both the 6-inch and 8-inch casings were then left in place during construction of the wells to maintain the integrity of the borehole. The total depths of the boreholes varied from 119.0 feet bgs to 156.5 feet bgs (elevations varying from 181.7 feet AMSL to 197.5 feet AMSL) using a 4-inch inside diameter core barrel. Soil cores were described on-site by a geologist. Soil borings with soil descriptions and well construction logs are included in **Appendix E**.

After the completion of soil coring efforts at each location, the on-site geologist chose the final intervals in which to construct the monitoring well pairs. **Figure 4-3** shows a typical well construction detail. For each location, both shallow and deep intervals were chosen for construction of a monitoring well. The well pairs were installed within one boring with the bottom well being constructed first in a manner similar to that previously described for the piezometers in **Section 4.3.1**. Because two wells were installed in one boring, centralizers were utilized to maintain a proper distance between the well screens and boring annulus or riser for the other well. Once the sand pack was placed for the lower screened interval, a bentonite seal was installed from the top of the sand pack for the lower screened interval to the bottom of the screened interval for the shallow location. The 6-inch inside diameter casing was removed from the lower section of the borehole during construction of the deep monitoring well. After the bentonite seal was allowed to properly set, construction of the shallow well commenced. The

riser and screened interval was lowered into place with a centralizer being utilized to maintain proper separation between the well screen, boring annulus, and the riser for the deeper well. Once the screen and riser for the lower well were set in place, construction of the well proceeded as previously described. A summary of the drilling efforts and well installation details are included as **Table 4-3**.

The monitoring wells were developed no sooner than 24-hours after installation in order to provide enough time for the seal and grout to set. Well development records are included as **Appendix E**. The ground surface adjacent to each monitoring well location and the top of casing elevations of each of the monitoring wells were surveyed by a Professional Land Surveyor. The ground surface was measure to the nearest 0.1 feet AMSL while the top of casing elevations were measured to the nearest 0.01 feet AMSL. Ground surface and top of casing elevations are included on **Table 4-3**.

4.3.7 Monitoring Well Pair Sampling

Following installation and development of the final well cluster, the wells were allowed to stabilize for at least two weeks prior to collecting groundwater samples. After this period, the field team collected groundwater samples from each of the newly installed wells during three sampling events and analyzed the samples for RDX and total uranium and/or uranium isotopes. The three independent groundwater sampling events were conducted at approximately four-month intervals from July 2012 through February 2013. In order to collect representative samples of the screened interval and significantly reduce the volume of IDW, the groundwater samples were collected using passive sampling techniques. The sampling method chosen involved using two-inch diameter HydraSleeve™ discrete samplers. The samplers consist of non-reactive sampling bags with a check valve at the top that allows the samplers to be lowered into the wells and retrieved at a later date. The samples do not fill with water until retrieved from the well. As such, the samplers can be lowered into the well during one mobilization and then, after the well is allowed to re-equilibrate, the samplers can be retrieved, and a representative groundwater sample can be collected. These samplers provided the ability to collect water from much of the screened interval while providing adequate sample volume and producing almost no waste to be disposed.

For the first sampling event, the HydraSleeves™ were installed in the new wells on 06 June 2013 after all wells had been developed. The samplers were installed in the wells in accordance with procedures outlined in the QAPP Addendum (PIKA-Pirnie JV, 2012) and the appended SOP. Based upon horizontal groundwater flow velocities previously calculated for the site, a minimum equilibration period of two weeks was deemed appropriate between placing and retrieving the samplers. The samplers were retrieved and the first round of groundwater samples was collected between 10 and 12 July 2012. Prior to retrieving the samplers, water level measurements were recorded at the well location being sampled. Samplers were retrieved in accordance with the QAPP Addendum and SOP. After the samplers were removed from a well, a multi-parameter water quality probe was lowered into the well and allowed to stabilize while the sample jars were filled. Turbidity, conductivity, pH, temperature, and DO were measured at each well and recorded in field notes. The sample containers were filled directly from the HydraSleeves™ except for the U samples which were run through a 0.45 micron filter using a peristaltic pump. Once the sample containers were filled, they were labeled and packed in accordance with

procedures outlined in the QAPP. After the groundwater samples were collected, the samplers were discarded. New clean samplers were then installed in each of the wells.

Two additional sampling events were completed following the same procedures described above. The samplers placed in the wells after the previous round of sampling were removed from the wells in order to collect groundwater samples for the subsequent round of sampling. The second round of groundwater samples was collected on 15 and 16 October 2012. The third round of groundwater samples was collected on 12 and 13 February 2013. Samplers were not left in the wells following the third round of sampling. A summary of sampling completed from the well pairs is included in **Table 4-4**.

4.3.8 Decontamination Procedures

Temporary decontamination pads were constructed at a central location for decontaminating the drill rigs and tooling between soil boring, piezometer, and well locations. One pad was constructed for the 2009 drilling effort and disposed of following completion of those activities. Another pad was constructed for the 2012 drilling effort and disposed of following completion of those activities. Each decontamination pad consisted of a 2-inch-by-6-inch wood framed box and two layers of 6 mil plastic sheeting. The plastic sheeting was underlain by one-half-inch-thick polyethylene ground protection mats to prevent puncturing of the plastic sheeting. All sampling equipment (bailers and submersible pumps) with the exception of the disposable HydraSleeves™ were decontaminated prior to sampling at each interval using an Alconox™ wash solution and potable water rinse. The temporary well screen and drill rods utilized during the depth-discrete sampling were decontaminated between sample intervals and soil boring locations using a high pressure steam cleaner. The sampling equipment decontamination fluids were collected and transferred to a holding tank where the temporary decontamination pad was setup. High pressure steam cleaning between soil boring locations occurred at the decontamination pad, with decontamination fluids temporarily stored in a holding tank. All decontamination fluids were handled as IDW, in accordance with the procedures outlined in the project QAPP and in compliance with Fort Jackson's Investigation Derived Waste Management Plan (USACE, 1998). Following the completion of the groundwater assessment tasks, the temporary decontamination pads were dismantled and the expendable materials (wood and plastic sheeting) were disposed of in a 30-cubic-yard roll-off container leased by ARCADIS during the Phase II assessment activities. Waste Management, Inc. disposed of the materials in the roll-off container as municipal solid waste.

4.3.9 Investigative-Derived Waste Sampling

Waste disposal characterization samples were collected from the soil cutting stockpiles. To obtain the waste disposal characterization samples, each soil cutting stockpile first was sampled by obtaining a five-point composite sample. These composite soil samples were collected from each stockpile and then combined into two waste disposal characterization samples, with an effort to equally represent the total volume of each soil stockpile for the corresponding waste disposal characterization composite sample. For example, the soil cutting composite samples from the larger soil stockpiles (*i.e.*, from the deeper borings) had larger volumes of soil added to the waste disposal characterization samples. The two waste disposal characterization composite soil samples were then submitted for full toxicity characteristic leaching procedure (TCLP)

analysis, plus explosives and perchlorate analyses. Specifically, the waste disposal characterization soil samples were analyzed for the following parameters:

- TCLP metals by SW6010B/SW7471A
- TCLP organochlorine pesticides by SW8081A
- TCLP chlorinated herbicides by SW8151A
- TCLP volatile organic compounds (VOCs) by SW8260B
- TCLP semivolatile organic compounds (SVOCs) by SW8270C
- Explosives by USEPA 8330A
- Perchlorate by USEPA 6850
- Percent solids
- Flashpoint by SW1010
- Reactivity, cyanide by SW9014R
- Reactivity, sulfide by SW9034R
- pH by SW9045C

A waste disposal characterization sample was also collected, using a bailer, from the tank containing the decontamination and well development water. The waste disposal characterization water sample was analyzed for the following parameters:

- Organochlorine pesticides by SW8081A
- Chlorinated herbicides by SW8151A
- VOCs by SW8260B
- SVOCs by SW8270C
- Explosives by CAD13.3
- Perchlorate by USEPA 6850
- Flashpoint by SW1010
- Total metals by SW6010B, SW7471A, and USEPA 200.8
- Reactivity, cyanide by SW9014R
- Reactivity, sulfide by SW9034R
- pH by SW9040

The results of the waste characterization sample analyses and a description of the subsequent procedures used to handle the soil cuttings and decontamination/well development water are presented in **Section 6.1**.

4.4 Quality Assurance / Quality Control

Prior to commencing the groundwater investigation tasks, a sample of the source water used in the drilling process and decontamination procedures was collected and analyzed for MCOC. The source water was obtained from a supply well located in the cantonment area of McCrady Training Center and the sample was identified as GW1-MTC1-GW-01.

Additional QA/ quality control (QA/QC) samples were collected to evaluate the field collection methods and the laboratory analytical techniques for surface water samples, sediment samples, and groundwater samples. The QA/QC samples consisted of duplicate samples, matrix spike / matrix spike duplicate (MS/MSD) samples, and equipment blanks. Triplicate samples were collected at each benthic macroinvertebrate location for QC purposes. In addition, 10% of the benthic macroinvertebrate samples were re-identified at the Clemson University laboratory as a method to verify the data. If an error of greater that 5 percent was found, the samples for that sampling event at the location affected by the error were re-identified.

Internal field sampling audits were performed by Susan Burtnett of ARCADIS for surface water, sediment, and benthic macroinvertebrate sampling on 1 and 2 April 2009 and by Larry Jordan of ARCADIS for groundwater sampling on 12 and 13 May 2009. Field QC samples were collected for each medium in accordance with the project QAPP as described below.

4.4.1 Duplicates

Duplicate samples were collected at a rate of at least 1 per 10 samples with at least 1 duplicate per mobilization. Duplicate samples were collected simultaneously from the same source under identical conditions and submitted to the laboratory as indistinguishable samples and labeled accordingly.

Surface water duplicates during the wet season and dry season were considered co-located samples from two side-by-side composite samplers and carboy setups. The sample collection tubes from both samplers were attached to a single polyvinyl chloride stake in the center of the stream channel.

4.4.2 MS/MSD

Additional water volume was not needed for metals and hardness MS/MSD analysis in surface water. Sub-samples were obtained from the parent sample by the analytical laboratory. Separate sample containers for MS/MSD analyses were necessary only for explosives. For sediment samples, sub-samples were obtained from the primary sample for MS/MSD analysis. MS/MSD samples were analyzed at a rate of 5 percent for surface water and sediment.

Additional sample volume was collected for all analytes for groundwater. During each phase of sampling, MS/MSD samples were collected at a rate of 5 percent for groundwater.

4.4.3 Equipment Blanks

Equipment blanks were collected at least once per mobilization and at a minimum rate of 5 percent for surface water and sediment. For surface water, the equipment blank was collected using the entire sampler and carboy sampling train and the entire peristaltic pump sample

collection train. Prior to setting up the composite sampler and placing the tubing into the stream channel, transfer pump, tubes, and filters were set up as if a sample was going to be collected from the carboy. Approximately 4 liters of clean deionized (DI) water was pumped through the system and into the carboy. Approximately 100 milliliters of DI water was then pumped from the carboy to purge the transfer pump tubing and 0.45-micron filter. Once the transfer tubing and filter were purged, the equipment blank was collected. For sediment, the equipment blank was collected by passing analyte-free DI water over a decontaminated sediment sampler into the sampling containers. For groundwater, equipment blanks for explosives were collected by passing analyte-free DI water through a length of clean tubing from the batch used to sample the wells using a peristaltic pump. For perchlorate and metals, the appropriate filter was added to the tubing train and water was collected after passing through the tubing and appropriate filter.

4.5 Sample Identification

Samples collected at Fort Jackson and McCrady Training Center were identified using the procedures detailed in the QAPP. Each sample was labeled with a seven-character identification that consisted of a four-character sampling event identifier, three-character sampling location identifier, two-character matrix code, two-character location code, and two-character identification code. Unique sequential sample numbers began with 01. QC samples (*e.g.*, duplicates and equipment blanks) received unique sequential sample numbers and were not identified as QC samples on the laboratory COC. MS/MSD samples were collected from parent primary samples in the laboratory.

The surface water and sediment samples collected at Fort Jackson and McCrady Training Center used the unique sequential sample numbers shown in **Table 4-1**. The groundwater samples collected at Fort Jackson and McCrady Training Center used the unique sequential sample numbers shown in **Table 4-2** and **Table 4-4**.

Groundwater samples collected during the 2009 sampling event were the first samples collected from each location and, therefore, are labeled with the sampling event designation GW1. The location code varies according to the sample point from which samples were collected. Groundwater samples collected from on-installation wells at Weston Lake contain the location code WL. Groundwater samples collected from piezometers contain the location code PX, where X corresponds to the piezometer location from which the sample was collected. Depth-discrete samples contain the location code SBX+YY, where X represents the number for the soil boring from which they were collected and YY represents the depth below the identified water table in feet. The analytical laboratory erroneously transcribed the sample identifications (IDs) with a minus ("-") following the soil boring ID, instead of a plus ("+"). To maintain consistency between the laboratory reports, the analytical data tables, and the report text, the minus sign has been adopted to identify the depth-discrete sample depth below the water table. For example, a sample collected from soil boring SB-3 at 20 feet below the water table would be identified as GW1-SB3-20-GW-01. It should be noted, however, that the field forms included in **Appendix D** maintain the original sample identification convention, and the depth-discrete sample depths below the water table are identified with a plus sign. Samples collected at the water table are identified as SBX-WT. The final identifiers placed at the end of the unique identifier (GW-01 in the example above) in that that the sample is groundwater (GW) and that it is either a primary sample (01), a duplicate (02), or part of an MS/MSD pair (02 and 03).

Groundwater samples collected during the July 2012 sampling event were the first samples collected from each of the monitoring well locations and, therefore, are labeled with the sampling event designation GW1. The location code for these wells MW for monitoring well. The letters RS were used to denote that the wells were drilled using Rotosonic™ drilling methods. The final three characters (*e.g.* 0XS) are used to designate the well location (0X) and whether the sample was collected from the shallow (S) or deep (D) well.

Table 4-1: Surface Water Investigation Samples
Fort Jackson and McCrady Training Center, SC

(a) Surface Water Samples

Location		Event	Field Sample ID	Collected		Composite	QA/QC
				Date	Time		
Gills Creek	GC1	WETA	WETA-GC1-SW-01	6-Apr-2009	13:45	Y	Primary

Depths shown are approximate and were adjusted based on subsurface lithology. Bentonite seals will be placed at the appropriate depths to isolate water bearing zones and prevent groundwater communication between confining units.

5 Data Analyses

5.1 Laboratory Analytical Methods

Surface water, sediment, and groundwater samples were submitted to DoD Environmental Laboratory Approval Program-certified laboratories (GPL, Test America, and Brooks Rand Laboratories, and the Department of Forestry and Natural Resources at Clemson University, South Carolina for benthic macroinvertebrates) for analysis. The following analytical methods were used for media-specific analysis.

Surface water was analyzed for:

- Explosives by USACHPPM SOP CAD Method 13.3
- Perchlorate by USEPA Method SW6850
- Dissolved metals (Sb, Cu, Pb, Zn, and W) by USEPA Method 1638M
- Hardness metals (calcium and magnesium) by USEPA Method 200.7

Sediment was analyzed for:

- Explosives by USEPA Method SW8330A
- Total metals (Sb, Cu, Pb, Zn, and W) by USEPA Method SW6020
- TOC by USEPA technical report number CE-81-1 (Walkley-Black Method)

Benthic Macroinvertebrates were analyzed for:

- Species diversity (Shannon's diversity index)
- Species richness
- Ephemeroptera, plecoptera, and trichoptera (EPT) richness
- EPT percent contribution

Groundwater was analyzed for:

- Explosives by USACHPPM SOP CAD 13.3 (2009 samples) and by USEPA 8330B (2012/2013 samples)
- Perchlorate by USEPA 6850 (2009 samples)
- Hardness metals (calcium and magnesium) plus sodium by USEPA E200.7 (2009 samples)
- Total and dissolved metals (Sb, Cu, Pb, Zn, and W) by USEPA 200.8 (2009 samples)
- U and U-isotopes by USEPA 6020 (2012/2013 samples)
- Anions (sulfate, chloride, and nitrate) by USEPA 300.0 (2009 samples)
- Alkalinity by USEPA 310.1/SM2320B (2009 samples)
- TDS by SM2450C (2009 samples)

These analytical methods for MCOC achieve the project quantitation limits of at least one-third and in most cases one-tenth the PALs. Therefore, in the evaluation of analytical data in **Section 6**, statements about "non-detect" results mean that a chemical was not detected above the laboratory detection limit. Tabulated results for all analyses appear in **Appendix B**.

5.2 Data Validation

All laboratory results were subjected to third-party data validation. Ninety percent of the data were subjected to USEPA Level 3 data validation. For organic analyses, this included a review of the following:

- Holding times
- Initial calibration
- Continuing calibration
- Blanks
- Surrogate recovery
- MS and MSD recovery
- Laboratory control sample recovery
- Internal standard performance
- Field duplicate sample analysis relative percent difference (RPD)
- Reporting limits
- Overall assessment of data in the sample delivery group (SDG)

For inorganic analyses, this included a review of the following:

- Holding times
- Initial calibration
- Continuing calibration
- Blanks
- MS recovery
- Laboratory duplicate sample RPD
- Laboratory control sample recovery
- Inductively coupled plasma mass spectrometry interference check
- Method of standard additions and serial dilution checks
- Field duplicate sample analysis RPD
- Reporting limits
- Overall assessment of data in the SDG

Ten percent of the data were subjected to USEPA Level 4 data validation. Level 4 data validation includes everything listed for Level 3 data validation, as well as additional reviews. For the Level 4 data validation for organic analyses, this included a review of the following:

- Compound identification
- Compound quantitation and detection limits
- Tentatively identified compound verification (gas chromatography / mass spectrometry)
- System performance

For the Level 4 data validation for inorganic analyses, this included a review of the following:

- Analyte identification
- Analyte quantitation and detection limits
- System performance

The review of nitroaromatics and nitramines data analyzed by USEPA SW 846 Method 8330A (sediments and 2012/2013 groundwater data) and per USACHPPM SOP CAD 13.3, March 2004, GPL SOP Q.23, Nov. 2008, and USEPA SW 846 Method 8095 (surface water and groundwater) followed a modified outline of the *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review* (2008).

The review of perchlorate data analyzed by USEPA SW 846 Method 6850 followed a modified outline of the *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review* (2008), as there are no current guidelines for this method. In the absence of project-specific guidance, data were evaluated against the *Department of Defense Perchlorate Handbook*, Revision 1, Change 1, August 2007 and USEPA SW846 Method 6850.

The review of the data listed below followed a modified outline of the *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review* (2004):

- Metals data by USEPA SW 846 Method 6020 (sediments)
- TOC data by USEPA technical report number CE-81-1 (Walkley-Black Method; sediments)
- Metals data per USEPA 200.7 (surface water)
- Dissolved metals (Sb, Cu, Pb, Zn, and W) by USEPA Method 1638M (surface water)
- U and U-isotope data per USEPA SW 846 Method 6020 (2012/2013 groundwater samples)
- Total and dissolved metals (Sb, Cu, Pb, Zn, and W) by USEPA 200.8 (2009 groundwater samples)
- Alkalinity data by USEPA Method 310.1 (2009 groundwater samples)
- Anions by USEPA Method 300.0 (2009 groundwater samples)
- TDS by USEPA Method 160.1 (2009 groundwater samples)

5.3 Data Analysis

All MCOC detected at downstream locations were evaluated against reference concentrations using direct comparison and statistical tests. All MCOC detected at downstream locations were evaluated against the PALs via direct comparison and calculation of the 95% upper confidence limit of the mean (UCLM). The weight-of-evidence approach used in the assessment helped control decision errors. MCOC concentrations from all sample results, general water quality parameters, and site conditions were taken into account to ensure that additional information did not provide indications that MCOC conclusions may be in error.

5.3.1 Statistical Analysis

The normality of MCOC concentration data was evaluated using the Shapiro-Wilk W test with an alpha value of 0.05. Where the data were normally distributed, statistical comparisons to the PALs were made using a one-tailed two-sample dependent variable t test with an alpha value of 0.05. If the data were identified as not normally distributed by the Shapiro-Wilk W test, then the Wilcoxon signed-rank test, also with an alpha value of 0.05, was used for the PAL comparison. The Wilcoxon signed-rank test generally was required when there was more than one non-detection of an analyte at one of the sites included in the comparison. All statistical tests were performed using STATISTICA, a data analysis software system by StatSoft, Inc. (Version 9.0, 2009).

The small size of the Phase II assessment data sets (four samples per location for surface water and three samples per location for sediment) reduces the ability of statistical hypothesis tests (t-test and Wilcoxon signed-rank test) to reject the null hypothesis of no difference between reference and downstream locations. This is particularly true if the data are not normally distributed or contain a high proportion of censored values (*i.e.*, nondetected values, where the reporting limit was used in the data analysis). To avoid false negatives (*i.e.*, the conclusion of no significant increases in downstream concentrations where such increases do exist), the statistical hypothesis tests were supplemented with a direct comparison of reference and downstream concentrations.

5.3.2 Surface Water Investigation Decision Rules

For the surface water system, the decision rules begin with a statistical comparison of MCOC concentrations at reference locations and downstream sampling sites. The initial question to be answered is: Are MCOC concentrations at the downstream site significantly higher than concentrations at the reference site for each decision unit? For this assessment, each watershed serves as a decision unit. The question is asked independently for MCOC in surface water and sediment. If the concentrations of an MCOC at the downstream site do not exceed the concentrations at the reference site based on a statistical comparison (e.g., t-test, Wilcoxon signed-rank test), then the evaluation of that MCOC is complete and activities at the associated operational range area(s) are not considered to be increasing MCOC concentrations in the surface water pathway (and, therefore, are not causing MCOC to migrate off range), and the operational range area(s) is placed in the Unlikely category for the surface water system. If the concentration of an MCOC is found to be significantly higher at the downstream site than at the reference site, operational range activities are considered to be potentially increasing that MCOC

concentration in the surface water pathway and that MCOC is evaluated further using additional decision rules.

MCOC with concentrations that are determined to be significantly higher at downstream sites than at reference sites are evaluated relative to PALs. For this comparison, the 95% UCLM downstream concentration is calculated for each MCOC. The question to be answered in this step is: Does the 95% UCLM concentration at the downstream site exceed the PAL? If the 95% UCLM concentration does not exceed the PAL, the evaluation of that MCOC ends and activities at the associated operational range area(s) are not considered to be causing off-range migration of MCOC in surface water to levels that could pose an unacceptable risk to human or ecological receptors. An operational range area is placed in the Unlikely category for the surface water system if no downstream surface water or sediment MCOC concentrations that exceed the reference site concentrations are also found to exceed the PAL. If the 95% UCLM of an MCOC concentration is found to exceed its PAL at the downstream location, then a limited risk evaluation for that MCOC is performed.

For ease of analysis, the statistical evaluation was performed in reverse order, comparing the downstream 95% UCLM concentrations to PALs and then performing the statistical comparison between the average reference and downstream concentrations. This was done to minimize the number of calculations, specifically to eliminate comparisons where both means were below the detections limits. Performing the statistical evaluation in reverse order has no effect on the final results and conclusions of the statistical evaluation or of the assessment.

The limited risk evaluation is conducted separately for human and ecological receptors. The question to be answered in the limited risk evaluation step is: Does exceedance of a PAL represent an unacceptable risk to human receptors, ecological receptors, or both? The outcome of the limited risk evaluation is the determination of whether there is an unacceptable risk or whether additional investigation and/or risk assessment is required before a determination can be made on the level of risk. The limited risk evaluation step incorporates review of surface water and sediment studies conducted by others, regulatory screening values established for human and ecological receptors, and studies regarding MCOC effects on these receptors (e.g., bioaccumulation of metal MCOC in the food chain). The limited risk evaluation includes review of the Phase II assessment data and comparison to the study findings and screening criteria. Benthic macroinvertebrate data are used, where available, to check for potential false-positive or false-negative errors and to support the data findings.

Page Intentionally Left Blank

6 Data Results

This section presents the results of field water quality measurements and laboratory analyses of IDW, surface water, sediment, and groundwater samples. The results of the benthic macroinvertebrate sample evaluations are also presented. The MCOC results discussion includes comparison of downstream/downgradient location results to PALs and reference conditions for surface water and sediment and groundwater. As discussed in Section 3.3.3, the PALs are based on the more conservative of applicable human and ecological criteria from the DoD RMUS *Operational Range Assessment Screening Values*, Version 6.0 (DoD, 2012) and South Carolina *Water Classifications and Standards* (SC code §61-68).

6.1 Investigation-Derived Waste

Samples of soil cuttings and purge water were collected and submitted for analytical testing in compliance with the *Fort Jackson Investigation-Derived Waste (IDW) Management Plan* (USACE, 1998).

Two composite soil samples (identified as IDW-Comp-SO-01 for the soil cuttings from SB-2, SB-3, P-7, P-8, P-10, and P-11 and IDW-Comp-SO-02 for the soil cuttings from SB-4, SB-5, SB-6, P-12, and P-13) were submitted for waste characterization. Based on the results of these analyses and in consultation with personnel from Fort Jackson's ENV, it was determined that soil cuttings from drilling activities could be spread safely on the ground surface at each of the locations from which the materials were generated. Analytical results for the waste characterization samples from the soil boring cutting stockpiles are included in **Appendix F**.

All decontamination fluid and discharge water generated during drilling activities, well installation and development, and purging during sampling activities were placed in a temporary storage tank located at a landing zone near piezometer P-11 and stored for the duration of field activities. At the end of the field effort, one grab water sample was collected from the tank and submitted for waste characterization. Based on the results of these analyses and in consultation with personnel from Fort Jackson's ENV, it was determined that water generated during the field investigation could be placed safely on the ground surface at the storage location. Water from the tank was placed on the ground surface near the decontamination area in a location that would not impact installation activities. The flow rate of water from the tank was regulated to prevent surface erosion and allow infiltration into the subsurface. Analytical results for the waste characterization samples from the decontamination fluid and discharge water are included in **Appendix F**.

6.1 Surface Water System Assessment Results

Surface water MCOC results are tabulated by watershed in **Tables 6-1** through **6-3** while field-measured surface water quality parameters are tabulated for all sites in **Table 6-4**. Sediment samples were collocated with surface water sampling locations and were analyzed for specific MCOC. Laboratory analytical results for sediment (less than 2 millimeters in diameter) analysis of MCOC concentrations are presented in **Tables 6-5** through **6-7**. Laboratory reports are provided in **Appendix B** and data usability reports are provided in **Appendix G**. The statistical evaluations discussed below are tabulated in **Appendix H**.

The following section discusses the results with a focus on the MCOC positively detected. The range of detected MCOC concentrations in surface water and sediment at each sample location is depicted in **Figures 6-1** through **6-13**.

6.1.1 Gills Creek Watershed

Surface water and sediment samples collected from location GC1 were upstream of range influence, while surface water and sediment samples collected from location GC2 were downstream of *Inconclusive* areas in the Gills Creek watershed. Samples collected from GC1 were used to characterize reference MCOC concentrations that may be naturally occurring or influenced by non-operational and/or off-installation activities. Samples collected from GC2 were used to evaluate the potential for off-range migration of MCOC to pose an unacceptable risk to downstream off-range ecological and human receptors.

6.1.1.1 Surface Water

Surface water analytical results for samples collected in the Gills Creek watershed are presented in **Table 6-1** and summarized in **Figure 6-1**.

GC1 (reference location)

Metals MCOC

Sb was detected in surface water in all four surface water sampling events; Cu, Pb, and Zn were detected in Wet A, Wet B, and Dry A sampling events; and W was not detected during any of the Phase II sampling events at location GC1. All detected metals concentrations in surface water at GC1 were below their respective PAL.

Explosives MCOC

Explosives were not detected in surface water during any of the Phase II sampling events at location GC1.

Perchlorate

Perchlorate was detected in surface water only during one event (Wet A) at a concentration of 0.08 µg/L, which is significantly below the PAL of 15 µg/L.

GC2 (downstream location)

Metals MCOC

Sb, Cu, Pb, and Zn were detected in surface water samples from all four events and W was detected in samples from the Wet A, Storm, and Dry A sampling events. Pb concentrations detected in surface water were greater than the PAL of 0.54 µg/L in all four sampling events, with concentrations ranging from 1.72 to 3.28 µg/L. The Pb concentration in the Storm event sample (3.28 µg/L) did not exceed the acute PAL of 14 µg/L. Cu concentrations in surface water samples from the Storm and Dry A events were greater than the PAL of 2.7 µg/L, with reported concentrations of 2.71 µg/L and 3.19 µg/L, respectively. The Cu concentration in the Storm event sample (2.71 µg/L) did not exceed the acute PAL of 3.6 µg/L. Detected concentrations of the remaining MCOC metals (Sb, W, and Zn) in surface water were below their respective PAL.

Explosives MCOC

Explosives were not detected in surface water during any of the Phase II sampling events at location GC2.

Perchlorate

Perchlorate was not detected in surface water during any of the Phase II sampling events at location GC2.

6.1.1.2 Sediment

Sediment analytical results for samples collected in the Gills Creek watershed are presented in **Table 6-5** and summarized in **Figure 6-1**.

GC1 (reference location)

Metals MCOC

Cu and Pb were detected in sediment at reference location GC1 during all three sampling events at concentrations below their respective PALs. Zn was detected in sediment only during the Wet A event. W was not detected in sediment during any of the Phase II sampling events at location GC1. All detected metals MCOC concentrations in sediment at GC1 were below their respective PAL.

Explosives MCOC

Explosives were not detected in sediment during any of the Phase II sampling events at location GC1.

GC2 (downstream location)

Metals MCOC

Sb, Cu, Pb, W, and Zn were detected in samples from all events. Pb concentrations in sediment samples from the Dry A and Dry B events were greater than the PAL of 47 mg/kg, with reported concentrations of 143 mg/kg and 144 mg/kg, respectively. The Cu concentration reported in the Dry B event sediment sample was 36.9 mg/kg, which exceeds the PAL of 34 mg/kg. Detected concentrations of the remaining MCOC metals (Sb, W, and Zn) in sediment were below their respective PAL.

Explosives MCOC

Explosives were not detected in sediment during any of the Phase II sampling events at location GC2.

6.1.1.3 Benthic Macroinvertebrates

No benthic macroinvertebrate data were collected at the Gills Creek locations per the rationale provided in the QAPP.

6.1.1.4 Sample Comparison and Statistical Evaluation

At the downstream location on Gills Creek (GC2), Cu and Pb were detected above the PALs in surface water and sediment. Detected Cu concentrations were higher at the downstream location than at the reference location in both surface water (**Figure 6-2**) and sediment (**Figure 6-3**) and downstream concentrations exceeded the PAL in both surface water and sediment at least once. Similarly, detected Pb concentrations are higher at the downstream location than at the reference location in both surface water (**Figure 6-4**) and sediment (**Figure 6-5**) and downstream concentrations exceeded the PAL in both surface water and sediment for multiple sampling events. Sb, W, and Zn were detected in surface water and sediment, but below the PALs.

Table H-1 (in **Appendix H**) provides a comparison of the detected MCOC concentration mean, maximum, and 95% UCLM to the PALs. **Table H-2** provides the results of the statistical comparisons between GC2 and GC1 for detections in surface water and sediment per the ORAP protocol to evaluate whether MCOC concentrations are statistically higher at the downstream sample location (GC2) than at the reference location (GC1). The statistical evaluation is described below.

Statistical Comparison to Surface Water PALs

The 95% UCLM for Sb (0.34 µg/L) in surface water does not exceed the PAL (5.6 µg/L), and none of the individual Sb results exceed the PAL. This provides a reasonable degree of confidence that Sb concentrations in surface water at location GC2 do not exceed the PAL.

The 95% UCLM for Cu (3.11 µg/L) in surface water exceeds the PAL (2.7 µg/L), and Cu was detected in all surface water samples, with two results above the PAL and two results just below the PAL. This provides a reasonable degree of confidence that Cu concentrations in surface water at location GC2 are near or exceed the PAL.

The 95% UCLM for Pb (3.44 µg/L) in surface water exceeds the PAL (0.54 µg/L), and Pb was detected in all samples with all results greater than the PAL. This indicates a high degree of confidence that Pb concentrations in surface water at location GC2 exceed the PAL.

The 95% UCLM for Zn (10.8 µg/L) in surface water does not exceed the PAL (36.5 µg/L), and none of the individual detections of Zn in surface water exceed the PAL. This provides a high degree of confidence that Zn concentrations in surface water at location GC2 do not exceed the PAL.

There is no PAL for W in surface water, as no regulatory limits currently exist. A review of the toxicity of W by USACHPPM (2004) suggests that a reasonable W surface water screening criterion would likely range between 35 and 175 µg/L. While these values cannot be used as a decision point for determining risk to receptors since they are not established regulatory criteria, a comparison shows that W detected in the surface water samples is several orders of magnitude below these values. The 95% UCLM for W (0.02 µg/L) is presented in **Table H-1** without an accompanying PAL. The 95% UCLM for W is several orders of magnitude below the range of toxicity values reviewed by USACHPPM and this provides a reasonable level of confidence that W, while present in the watershed, is not present at concentrations that would likely pose a risk to ecological receptors.

Statistical Comparison to Sediment PALs

The 95% UCLM for Cu (48.7 mg/kg) in sediment exceeds the PAL (34 mg/kg) (**Table H-1**). This provides a reasonable level of confidence that Cu concentrations in sediment at location GC2 exceed the PAL.

The 95% UCLM for Pb in sediment exceeds the PAL and two of three sample concentrations exceed the PAL of 47 mg/kg by one order of magnitude. The 95% UCLM value is relatively high (212.6 mg/kg) based on the maximum observation (144 mg/kg). Given the sample results, there is a high degree of confidence that Pb concentrations in sediment at location GC2 exceed the PAL.

The 95% UCLM for Zn in sediment exceeds the PAL, but none of the individual sample concentrations exceed the PAL. The calculated 95% UCLM is 151.4 mg/kg, and the PAL is 150 mg/kg. This provides a reasonable level of confidence that Zn concentrations in sediment at location GC2 do not exceed the PAL.

Statistical Comparisons to Reference Concentrations

The statistical comparisons of downstream concentrations to reference concentrations have limited utility with a small dataset, such as the one available for this study. However, these comparisons can be used to draw general conclusions about the dataset.

The statistical comparisons show that Sb, Cu, and Pb concentrations in surface water are significantly greater (defined as significantly different using an alpha of 0.05) at GC2 than at the upstream reference location GC1.

Statistical comparisons of Zn and W concentrations in surface water and Sb, Cu, Pb, W, and Zn concentrations in sediment (**Table H-2**) supported the null hypothesis of no significant differences. However, the downstream concentrations of Pb and Cu in sediment at GC2 were several orders of magnitude greater than the concentrations at the reference location GC1 for every sampling event. This is an example of a false negative error because Pb concentrations in sediment at GC2 (mean of 108.0 mg/kg) are obviously higher than Pb concentrations in sediment at GC1 (mean of 1.8 mg/kg). The false negative error is most likely due to the small number of samples collected.

6.1.1.5 Conclusions

The data presented above demonstrate that Cu and Pb are migrating off-range via Gills Creek in surface water and sediment.

MCOC in surface water and sediment were detected at concentrations below human PALs, consequently the source-pathway-receptor interaction for potential human receptors is likely incomplete. Furthermore, the PALs selected for human health are overly conservative for off-range migration in Gills Creek as these values are based upon drinking water criteria, when the only identified likely exposure route through the surface water pathway in the Gills Creek watershed is via ingestion of fish and dermal exposure and these exposure routes are typically less toxic than exposure via drinking water. Therefore, the potential off-range migration of

MCOC in the Gills Creek watershed is unlikely to pose an unacceptable risk to potential human receptors downstream of *Inconclusive* ranges.

MCOC metals (Cu and Pb) in surface water and sediment were detected above ecological PALs, consequently the source-pathway-receptor interaction for ecological receptors may be complete. Per the USACHPPM Phase II protocol (2009), additional evaluation is needed to confirm whether Pb and Cu are migrating off range in surface water at concentrations that may pose an unacceptable risk to the environment. A SLERA was conducted to address this question (see **Appendix I**). The SLERA conclusions are summarized in Section 7.1.

6.1.2 Colonels Creek Watershed

Surface water and sediment samples collected from locations CC1 and CC2 were upstream of range influence on separate tributaries to Colonels Creek, while surface water and sediment samples collected from location CC3 were downstream of *Inconclusive* areas in the Colonels Creek watershed at the operational range/installation boundary. Surface water and sediment samples from location JC1 were collected downstream of *Inconclusive* areas drained by Jumping Run Creek, a tributary to Colonels Creek, at the operational range/installation boundary.

Samples collected from CC1 and CC2 were used to characterize reference MCOC concentrations that may be naturally occurring or influenced by non-operational and/or off-installation activities. Samples collected from CC3 and JC1 were used to evaluate the potential for off-range migration of MCOC to pose an unacceptable risk to downstream off-range ecological and human receptors.

No MCOC (metals, explosives, and perchlorate) were detected above their respective PALs at the downstream locations CC3 and JC1 in the Colonel Creek Watershed. This finding alone demonstrates that MCOC are not likely migrating off-range at unacceptable levels via surface water or sediment in Colonels Creek.

A summary of MCOC detections in the Colonels Creek watershed is included below to support the following discussion and conclusions.

6.1.2.1 Surface Water

Surface water analytical results for samples collected in the Colonels Creek watershed are presented in **Table 6-2** and **Figure 6-6**.

CC1 (reference location)

Metals MCOC

At CC1, Sb, Cu, Pb, and Zn were detected in surface water samples from the Wet A, Wet B, and Dry A events. All detected metals concentrations in surface water at CC1 were below their respective PAL. W was not detected in any surface water samples collected at CC1.

Explosives MCOC

Explosives were not detected in surface water during any of the Phase II sampling events at location CC1.

Perchlorate MCOC

Perchlorate was not detected in surface water during any of the Phase II sampling events at location CC1.

CC2 (reference location)

As discussed above in Section 4.2, the dry season, clear weather event (Dry A) surface water sample was not collected at CC2, as the streambed was dry during the sampling event.

Metals MCOC

At CC2, Pb was detected in surface water samples from the Wet A, Wet B, and Storm sampling events; Sb was detected in samples from the Wet A and Storm sampling events; and Cu and Zn were detected in samples from the Wet A and Wet B sampling events. Pb concentrations were greater than the PAL of 0.54 µg/L in samples from the Wet A, Wet B, and Storm sampling events, with concentrations ranging from 1.05 to 1.12 µg/L (the Storm event Pb concentration of 1.08 µg/L did not exceed the acute Pb PAL of 14 µg/L). W was not detected in surface water during any of the Phase II sampling events at CC2. All detected metals concentrations in surface water at CC2, with the exception of Pb, were below their respective PALs.

Explosives MCOC

Explosives were not detected in surface water during any of the Phase II sampling events at location CC2.

Perchlorate MCOC

Perchlorate was not detected in surface water during any of the Phase II sampling events at location CC2.

CC3 (downstream location)

Metals MCOC

At CC3, Pb was detected in surface water samples from all events; Sb was detected in samples from the Wet A, Storm, and Dry A sampling events; Cu and Zn were detected in samples from the Wet A, Wet B, and Dry A sampling events; and W was detected in the sample from the Wet B sampling event. None of the metals concentrations detected in surface water samples at CC3 were greater than the PALs.

Explosives MCOC

Explosives were not detected in surface water during any of the Phase II sampling events at location CC3.

Perchlorate MCOC

Perchlorate was detected in surface water only during the Wet B event at CC3 at a concentration less than both the PAL of 15 µg/L and the reporting limit of 0.2 µg/L.

JC1 (downstream location)

Metals MCOC

At JC1, Pb was detected in surface water samples from all events; Cu and Zn were detected in samples from the Wet A, Wet B, and Dry A events; and Sb was detected in samples from the

Storm and Wet A sampling events. None of the metals concentrations detected in surface water samples at JC1 were greater than the PALs.

Explosives MCOC

Explosives were not detected in surface water during any of the Phase II sampling events at location JC1.

Perchlorate MCOC

Perchlorate was detected during both Wet A and Wet B sampling events at JC1. The perchlorate detections during the Wet A and Wet B sampling events were less than the PAL of 15 µg/L and the reporting limit of 0.2 µg/L. Perchlorate was also detected in groundwater upgradient of Jumping Run Creek, but at concentrations well below the PAL.

6.1.2.2 Sediment

Sediment analytical results for samples collected in the Colonels Creek watershed are presented in **Table 6-6**.

CC1 (reference location)

Metals MCOC

In sediment, Pb was detected in samples from all sampling events and Zn was detected in the sample from the Wet A event. Sb, Cu, and W were not detected in sediment during any of the Phase II sampling events at CC1. All detected metals concentrations in sediment at CC1 were below their respective PALs.

Explosives MCOC

Explosives were not detected in sediment during any of the Phase II sampling events at location CC1.

CC2 (reference location)

Metals MCOC

In sediment, Cu, Pb, and Zn were detected in samples from all events and W was detected in the sample from the Wet A event. Sb was not detected in sediment during any of the Phase II sampling events at location CC2. Pb was detected at 60.9 mg/kg in the sediment sample from the Dry A event, exceeding the PAL of 47 mg/kg. No other metals MCOC (Sb, Cu, W, and Zn) were detected in sediment at concentrations above respective PALs at location CC2.

Explosives MCOC

DNB was detected in the Wet A sediment sample at a concentration of 0.038 mg/kg, which exceeded the TOC-adjusted sediment PAL of 0.035 mg/kg. No other explosives MCOC were detected in sediment during the Phase II sampling events at location CC2.

CC3 (downstream location)

Metals MCOC

In sediment samples collected at CC3, Cu and Pb were detected in samples from all events and Zn was detected in samples from the Dry B and Wet A events. None of the metals concentrations detected in sediment samples at CC3 were greater than the PALs.

Explosives MCOC

Explosives were not detected in surface water during any of the Phase II sampling events at location CC3.

JC1 (downstream location)

Metals MCOC

In sediment collected at JC1, Cu and Pb were detected in samples from all events and Zn was detected in the sample from the Wet A event. None of the metals concentrations detected in sediment samples at JC1 were greater than the PALs.

Explosives MCOC

Explosives were not detected in sediment during any of the Phase II sampling events at location JC1.

6.1.2.3 Benthic Macroinvertebrate Sampling Data

The results of the benthic macroinvertebrate laboratory evaluations (see Section 4.2.3) are presented in **Table 6-8**. Biodiversity indices, including Shannon's diversity index, species richness, EPT species richness, and percent EPT abundance were assessed for each sample. Shannon's diversity index, which accounts for both species abundance and evenness, commonly is used to represent species diversity in a community. The species richness represents the total number of all the benthic macroinvertebrate species for each sample separated into the lowest taxonomic level (genus/species whenever possible). The EPT richness is the number of species from the taxonomic orders Ephemeroptera, Plecoptera, and Trichoptera found in the sample. The percent EPT is the percentage of the total number of organisms found in the sample that are in the taxonomic orders of Ephemeroptera, Plecoptera, and Trichoptera.

Sample location CC2 exhibited significantly lower diversity and richness values than the other three sample locations (CC1, CC3, and JC1) during the wet season event (Wet A). Species abundance at CC2 was not distributed as evenly as in the samples from other sample locations. The EPT community accounted for approximately 44% of the total number of organisms collected at this site. Ninety-five percent of the EPT species came from two Plecoptera groups (*Leuctra sp*. and *Amphinemoura delosa*). The lack of flowing or standing water at CC2 during the dry season event (Dry A) prevented collection of benthic macroinvertebrate samples at this location. Species richness values were stable at CC1 and CC3 between sample events; however, species richness and EPT richness values at JC1 decreased by 30%. This decrease in richness values coincides with a large increase in plecotperan organisms.

Overall, samples collected during the wet season event (Wet A) had higher diversity index values than the Dry A event samples. During Wet A, Shannon's diversity index values were greater in the downstream samples (CC3 and JC1) compared to the upstream sample CC2, but very similar to the results from upstream sample CC1. During the Dry A event, Shannon's diversity index values were mixed; the value for the sample from CC3 (downstream) was greater than the value for the sample from CC1 (upstream), but the value for the sample from JC1 (downstream) was less than the value for the sample from CC1 (upstream).

6.1.2.4 Sample Comparison and Statistical Evaluation

No MCOC were detected above the PALs in surface water or sediment at the downstream locations in Colonels Creek (CC3 and JC1). Detected Cu concentrations at the downstream locations (CC3 and JC1) appear to be generally less than or comparable to the range of detected concentrations at the reference locations (CC1 and CC2) in both surface water (**Figure 6-7**) and sediment (**Figure 6-8**). Similarly, detected Pb concentrations at the downstream locations appear to be less than or comparable to the range of detected concentrations at the reference locations in both surface water (**Figure 6-9**) and sediment (**Figure 6-10**).

Table H-1 (in **Appendix H**) provides a comparison of the detected MCOC concentration mean, max and 95% UCLM to the PALs, while **Table H-3** provides the results of the statistical comparisons between the downstream locations (CC3 and JC1) and the reference location CC1 for detections in surface water and sediment per the ORAP protocol. CC1 was conservatively used as the reference location for comparison because detected concentrations were lower at CC1 than at CC2. **Table H-4** provides the results of the statistical comparisons between the downstream locations and the reference location (CC1) for benthic macroinvertebrate metrics. Results indicate no significant difference in benthic macroinvertebrate metrics between the reference and downstream locations.

6.1.2.5 Discussion and Conclusions

The data above demonstrate that MCOC are not migrating off-range in the Colonels Creek surface water system at concentrations that pose an unacceptable risk to human and ecological receptors and indicate that source-pathway-receptor interactions for the Colonels Creek watershed are incomplete for human and ecological receptors.

6.1.3 Cedar Creek Watershed

Surface water and sediment samples collected from locations WL1 and WL2 were downstream of *Inconclusive* areas in the Cedar Creek watershed and located on the two upper branches of Weston Lake within the non-operational area. Because Cedar Creek and its tributaries originate within the *Inconclusive* areas, no suitable reference location could be found within the watershed. Therefore, CC1 on Colonels Creek (described above in Section 6.1.2) was used as a proxy reference location for the downstream Cedar Creek sample locations.

Samples collected from WL1 and WL2 were used to evaluate the potential for off-range migration of MCOC to pose an unacceptable risk to downstream off-range ecological and human receptors.

6.1.3.1 Surface Water

Surface water analytical results for samples collected in the Cedar Creek watershed are presented in **Table 6-3** and **Figure 6-11**, while the surface water analytical results for the reference location (CC1) are presented in **Table 6-2** and **Figure 6-6**.

CC1 (reference location)

Metals MCOC

At CC1, Sb, Cu, Pb, and Zn were detected in surface water samples from the Wet A, Wet B, and Dry A events. All detected metals concentrations in surface water at CC1 were below their respective PALs. W was not detected in any surface water samples collected at CC1.

Explosives MCOC

Explosives were not detected in surface water during any of the Phase II sampling events at location CC1.

Perchlorate MCOC

Perchlorate was not detected in surface water during any of the Phase II sampling events at location CC1.

WL1

Metals MCOC

At WL1, Sb was detected in surface water samples from the Wet A, Storm, and Dry A sampling events; Pb was detected in samples from the Wet A, Wet B, and Dry A events; and Cu and Zn were detected in samples from the Wet A and Wet B events. W was not detected in surface water during any of the Phase II sampling events at location WL1. No metals MCOC were detected above PALs in surface water at downstream location WL1.

Explosives MCOC

RDX was detected at concentrations less than its reporting limit and the PAL at the downstream location WL1 in surface water samples collected during the Wet A and Dry A events. No other explosives MCOC were detected in samples collected at WL1.

Perchlorate MCOC

Perchlorate was detected in surface water only during one event (Wet A) at a concentration of 0.098 µg/L, which is significantly below the PAL of 15 µg/L.

WL2

Metals MCOC

At WL2, Zn was detected in surface water samples from all events; Pb was detected in samples from the Wet A, Wet B, and Dry A events; Sb was detected in samples from the Wet A, Storm, and Dry A events; and Cu was detected in samples from the Wet A and Wet B events. W was not detected in surface water during any of the Phase II sampling events at location WL2. No metals MCOC were detected above PALs in surface water at downstream location WL2.

Explosives MCOC

Explosives were not detected in surface water during any of the Phase II sampling events at location WL2.

Perchlorate MCOC

Perchlorate was detected in surface water during only one event (Wet A) at a concentration of 0.1 µg/L, which is significantly below the PAL of 15 µg/L.

6.1.3.2 Sediment

Sediment analytical results for samples collected in the Cedar Creek watershed are presented in **Table 6-7**, while the sediment analytical results for the reference location (CC1) are presented in **Table 6-6**. Results for Cu and Pb in sediment are shown graphically on **Figures 6-12** and **6-13**, respectively.

CC1 (reference location)

Metals MCOC

In sediment, Pb was detected in samples from all sampling events and Zn was detected in the sample from the Wet A event. Sb, Cu, and W were not detected in sediment during any of the Phase II sampling events at CC1. All detected metals concentrations in sediment at CC1 were below their respective PALs.

Explosives MCOC

Explosives were not detected in sediment during any of the Phase II sampling events at location CC1.

WL1

Metals MCOC

In sediment, Cu, Pb, and Zn were detected in samples from all events and Sb was detected in the sample from the Wet A event. W was not detected in surface water during any of the Phase II sampling events at location WL1. All detected metals concentrations in sediment at WL1 were below their respective PALs.

Explosives MCOC

Explosives were not detected in sediment during any of the Phase II sampling events at location WL1.

WL2

Metals MCOC

In sediment, Cu, Pb, and Zn were detected in samples from all sampling events and Sb was detected in the sample from the Wet A sampling event. W was not detected in sediment during any of the Phase II sampling events at location WL1. The detected Pb concentration was greater than the PAL of 47 mg/kg in the sediment sample from the Wet A event, with a reported concentration of 54.3 mg/kg. The detected Cu concentration also was greater than its PAL of 34 mg/kg in the sediment sample from the Wet A event, with a reported concentration of 36.3 mg/kg. All other metal MCOC (Sb, W, and Zn) concentrations in sediment at WL2 were below their respective PALs.

Explosives MCOC

Explosives were not detected in sediment during any of the Phase II sampling events at location WL2.

6.1.3.3 Benthic Macroinvertebrates

No benthic macroinvertebrate data were collected at the Cedar Creek locations because the sampling locations are in Weston Lake, and, thus, could not be compared to the upstream Colonels Creek sampling locations given the significant difference in habitats.

6.1.3.4 Sample Comparison and Statistical Evaluation

At the downstream locations in Cedar Creek (WL1 and WL2), no MCOC were detected above the PALs in surface water. The only MCOC detected above PALs in sediment were Cu and Pb at WL2 during the Dry A event. **Table H-1** provides a comparison of the detected MCOC concentration mean, max and 95% UCLM to the PALs. **Table H-2** provides the results of the statistical comparisons between the downstream locations (WL1 and WL2) and the reference location CC1 for detections in surface water and sediment per the ORAP protocol.

Statistical Comparison to Sediment PALs

The 95% UCLM for Cu (46.7 mg/kg) in sediment at WL2 exceeds the PAL, and one of the individual Cu results exceeds the PAL. The 95% UCLM for Pb (68.8 mg/kg) in sediment at WL2 exceeds the PAL, and one of the individual Pb results exceeds the PAL.

Statistical Comparisons to Reference Concentrations

The statistical comparisons of downstream concentrations to reference concentrations have limited utility with a small dataset such as the one available for this study, particularly for sediment, where only three data points are available. With that caveat, **Table H-5** shows that the statistical tests comparing Cu and Pb at WL2 to the reference concentrations could not reject the null hypothesis of no significant difference between reference and downstream locations.

6.1.3.5 Discussion and Conclusions

Detected concentrations of Cu and Pb in sediment exceeded the PALs at WL2; however, these exceedances may be due to metals sources not covered by the ORAP. As discussed in Section 4.2.1, the location of WL2 was shifted during field activities because the wet season sampling location was not accessible by boat during the dry season since water levels decreased in Weston Lake. The shifted location may have been located within the former target area for a small arms range being addressed under the MMRP. The metals MCOC concentrations reported for the sample obtained from WL2 during the Dry A and Dry B events are greater than those reported for the sample obtained from WL2 during the Wet A event. Additionally, the MCOC detected (metals) are more typical of small arms range use. The possibility exists that MCOC at WL2 may be from sources not associated with the operational range areas evaluated under ORAP. The area of Weston Lake where WL2 is located is within the site boundary of a Military Munitions Response Program site; further evaluation of Pb and Cu at this site will be addressed as part of studies conducted under the MMRP.

6.2 Groundwater System Assessment Results

The assessment of the groundwater system at Fort Jackson and McCrady Training Center was completed in three phases. The first phase, in 2009, consisted of the installation of piezometers to collect water level data to inform the subsequent phases of the investigation. The second phase, also in 2009, consisted of the drilling of soil borings and the collection of groundwater

samples to obtain preliminary information regarding the presence or absence of MCOC in groundwater. Based upon the results of the 2009 assessment, additional data and sample collection was required to answer the assessment questions for groundwater. As previously described, these activities included the installation of monitoring well pairs in 2012 and the completion of three sampling events conducted from July 2012 through February 2013.

As described in previous sections, data gathered during the groundwater system assessment activities included the following:

- Detailed, installation-specific subsurface geologic information
- Shallow groundwater elevations from which groundwater flow directions were interpreted
- Depth-discrete and supply well groundwater sampling results for MCOC
- Monitoring well pair groundwater sampling results for MCOC

The results of the combined assessment are described below.

6.2.1 Geologic Conditions

Fort Jackson and McCrady Training Center overlie predominantly Cretaceous sediments of the Middendorf Formation, which is the primary aquifer in the area. Locally, Tertiary age unconsolidated sediments overlie the Middendorf Formation. These Tertiary sediments are mainly confined to the tops of highlands, but make up a larger proportion of the exposed units in the northern portions of the installation. In the Fort Jackson and McCrady Training Center area, the Middendorf Formation is described as consisting of unconsolidated fine- to coarse-grained sand with varying amounts of interstitial clay (kaolin), interbedded with laterally discontinuous thin silty and clayey beds and occasional thin gravelly lenses. In localized areas, clay (kaolin) lenses are of sufficient thickness, quality, and lateral extent to be of economic significance. These units reportedly have been mined at the ground surface on Fort Jackson north-northwest of the groundwater assessment area (Kite, 1988).

The piezometer installations and soil borings advanced during the assessment provided additional detailed geologic information. The subsurface conditions encountered consisted of predominantly fine- to medium-grained sand, silty sand, clayey sand, and clay. The sands were predominantly poorly graded, subangular, quartz sands with frequent heavily micaceous zones. The clays encountered varied from sandy clay units to very hard, massive, white to gray clay. The test boring logs for the piezometers and soil borings are presented in **Appendix E**. The test boring logs were used to create conceptual cross sections through the test boring and piezometer locations near the installation boundary. Cross sections A-A' and B-B' are shown on **Figure 6-14**. Most of the uppermost clay layers did not readily correlate by elevation or general description from boring to boring and are considered laterally discontinuous clay lenses. A lower and potentially continuous clay unit was encountered at borings SB-2, SB-3, SB-4, SB-5, and SB-6. This unit was a gray to white, massive, hard clay with dark red streaks or clasts. Its thickness ranged from 6 to 10 feet. Elevations of the top of this clay unit ranged from 212 feet AMSL at boring SB-2 to 174 feet AMSL at boring SB-3. The base of this clay ranged from 172 feet AMSL in SB-5 to 165 feet AMSL in SB-3. As described in the QAPP, the target depth for the soil borings and vertical aquifer sampling was approximately 150 feet AMSL. Soil borings

SB-3, SB-5, and SB-6 were advanced to approximately 150 feet AMSL. Soil borings SB-2 and SB-4 were terminated within the lower clay unit, which was shallower than the target depth, to avoid fully penetrating this clay unit. This was done because preliminary analytical results from SB-3 received in the field during drilling at SB-4 (and prior to the start of drilling at SB-2) indicated that MCOC were present in groundwater. Therefore, the project team opted not to penetrate a clay unit that was thought to be laterally continuous, thereby creating an avenue for potential MCOC migration.

Subsurface conditions encountered during drilling efforts in 2012 to install the monitoring well pairs were similar to those encountered previously with fine- to medium-grained sand with varying amounts of silt and clay making up most of the subsurface. These sandy units are interbedded with silty sand, clayey sand, and clay. Even over the smaller area covered by the soil borings drilled to install the well pairs, the clayey units encountered above approximately 225 feet AMSL appear to be laterally discontinuous. Each of these borings ended in a clayey unit that appears to be laterally continuous across the area where the well pairs were installed and as previously indicated across the larger area downgradient of the groundwater assessment area. At the borings for MW-RS-02 through MW-RS-07 the top of this lower clay unit was encountered at elevations varying from 202.5 feet AMSL to 185.9 feet AMSL. Drilling efforts were stopped when this clay was encountered in order to maintain the integrity of the clay as a confining unit. Therefore, the thickness of the clay in this region was not measured.

6.2.2 Groundwater Elevations and Aquifer Properties

As described in Section 4.3, the initial phase of drilling consisted of piezometer installation for the purpose of collecting groundwater elevation data in the areas interpreted to be down gradient of the groundwater assessment area and potential MCOC source areas. The groundwater elevation measurements and interpreted flow directions were used to select the locations for the soil borings used for the temporary well depth-discrete groundwater sampling performed subsequently as part of the groundwater assessment. Following installation and development of the piezometers, groundwater elevations were measured on 7 April, 17 April, 1 June, and 29 July 2009. The groundwater elevation measurements are summarized in **Table 6-9**. The groundwater elevation measurements collected on 7 April 2009 were used to generate the shallow groundwater flow directions near the groundwater assessment area shown on **Figure 6-15.** Based on the 7 April 2009 groundwater elevation measurements and interpreted groundwater elevation contours, shallow groundwater flows from the topographically elevated regions of the groundwater assessment area (just northeast of Weston Lake) to the west-southwest toward Weston Lake, south and southeast toward Leesburg Road and Jumping Run Creek, and east toward Colonels Creek. Groundwater in the northeastern portion of the groundwater assessment area flows north-northwest toward Buffalo Creek and Wise Marsh. Ground surface topography and the presence or absence of flowing water in the surface water bodies were considered during generation of the shallow groundwater contours. Since the subsurface soils are predominantly sand and are highly permeable, it is likely that the groundwater table mimics surface topography, flowing from the elevated regions to the lower elevations in the stream valleys. Field observations, such as the point at which the streams exhibited continual flow, were noted on maps during each sampling event and were also used in generation of the groundwater contours.

The staff gauge and adjacent piezometer measurements indicate that groundwater is discharging to the surface water bodies at the staff gauge / piezometer pair locations at the northern end of Weston Lake (SG/P-1), an unnamed tributary to Colonels Creek (SG/P-5), and Buffalo Creek (SG/P-6) (**Figure 6-15**). The staff gauge / piezometer pair located on Jumping Run Creek (SG/P-4) indicated that at that location, the creek was a losing stream during all but one of the measurement events. However, the area surrounding this staff gauge / piezometer pair had evidence of groundwater discharging to the ground surface in the form of springs discharging to small channels that feed the headwaters of Jumping Run Creek upslope and upstream of SG/P-4. The surrounding area was very wet and swampy with iron staining and lush vegetation indicative of continued wet conditions. Since no soil borings were advanced in this area, it is unclear whether these conditions represent the water table intersecting the ground surface or locally perched conditions. Therefore, the location of this staff gauge / piezometer pair may not accurately represent the surface water / groundwater interaction along this stretch of Jumping Run Creek. Staff gauge / piezometer pair SG/P-3 was located along the eastern shore of Weston Lake near the southern end of the lake. The piezometer was dry during three of the four measurement events, and subsurface soils encountered during the installation of piezometer P-3 were fine grained. Therefore, groundwater data obtained from SB/P-3 may not accurately represent the groundwater potentiometric level in this area. Neither of the data uncertainties described above is significant enough to impact the conclusions of this report.

Groundwater data collected as part of this investigation, coupled with data from previous investigations completed near the groundwater investigation area, indicate that the stratified groundwater system described for the larger area is also present on installation. As previously discussed, groundwater elevation data collected from piezometers as part of this investigation indicate that topography exerts a primary control on groundwater flow directions, with groundwater underlying the investigation area flowing radially to the west toward Weston Lake and Cedar Creek, to the south, and to the east. Additionally, data from piezometer / staff gauge pairs, along with observations made during the investigation, indicate that, locally, shallow groundwater flow discharges to tributaries of Cedar and Colonels Creeks (including Jumping Run Creek). However, groundwater discharge rates to these low-order tributaries vary seasonally. Groundwater flow of intermediate depth likely bypasses these tributaries, moving off installation and potentially discharging to more deeply incised higher order streams. Water level data collected in July 2012, October 2012, and February 2013 from the monitoring well pairs generally confirm the flow directions interpreted from the data collected in 2009. These data are included in **Table 6-9**.

Slug tests were completed as part of a previous investigation at two SWMUs within or near the groundwater assessment area (one SWMU is located approximately 1,500 feet west of SB-5 with another approximately 1,000 feet north of P-4) (Law Engineering and Environmental Services, 2003). The slug tests were used to measure hydraulic conductivities within the upper portion of the Middendorf Formation. K values at the first site (near SB-5) varied from 0.00026 feet/minute (1.10×10^{-4} centimeters/second [cm/s]) to 0.0028 feet/minute (1.19×10^{-4} cm/s). Using hydraulic gradients measured near the site, horizontal flow rates of 34 to 368 feet per year were calculated based on these K values. K values measured near P-4 varied from 0.0036 feet/minute (1.52×10^{-4} cm/s) to 0.0056 feet/minute (2.37×10^{-4} cm/s). Using hydraulic gradients measured near the site, horizontal flow rates of 189 to 294 feet per year were calculated based on these K values. The wells from which the slug tests were measured (as part of a previous

investigation of IRP sites) are shallower than those installed as part of this assessment. However, given that the descriptions from the boring logs are quite similar, the K values and flow rates likely represent reasonable estimates of aquifer properties within the investigation area deeper in the aquifer. The range in values agrees well with those reported for fine to medium grained unconsolidated sand deposits (Freeze and Cherry, 1979) similar to those observed at Fort Jackson and McCrady Training Center. Based upon the flow rates calculated from these data, precipitation that infiltrates through potential source areas within 2,000 feet of the installation and reaches the groundwater table could potentially reach the installation boundary in as little as seven years.

6.2.3 Groundwater Analytical Results

6.2.3.1 2009 Assessment

6.2.3.1.1 **Groundwater Quality Measurements**

As discussed in Section 4, groundwater quality measurements were recorded during well development and sampling activities in order to track water quality changes during purging, identify when water quality parameters had stabilized and groundwater samples could be collected, and measure important groundwater chemistry parameters. The chemical parameters measured included pH, specific conductance, turbidity, DO, and ORP. All measurements were noted on field sheets and/or in field notes and are included in **Appendix D**. The final measurements recorded during the collection of each groundwater sample in 2009 have been compiled and are included as **Table 6-10.**

pH measurements recorded during the 2009 sampling varied from 4.96 to 9.81. However, pH measurements above 7.0 occurred only at two locations. In 22 of the 29 samples, pH varied from 5.16 to 5.99. Specific conductance measurements recorded during the 2009 sampling varied from 0.005 millisiemens per centimeter (mS/cm) to 0.049 mS/cm. DO measurements recorded during the 2009 sampling varied from 0.62 mg/L to 14.33 mg/L. ORP measurements recorded during the 2009 sampling varied from -205 millivolts (mV) to 237 mV.

6.2.3.1.2 **MCOC Metals**

Groundwater samples collected in 2009 were analyzed for MCOC metals including Sb, Cu, Pb, W, and Zn. The results for all MCOC metals analyses for samples collected in 2009 are shown in **Table 6-11** and summarized below.

Results **-** Total Sb was detected in six of the 29 groundwater samples analyzed, with concentrations varying from 0.06 to 0.19 µg/L. Dissolved Sb was detected in three of the 17 groundwater samples analyzed, with concentrations varying from 0.059 to 0.12 µg/L. All detected total and dissolved Sb concentrations were estimated because they were less than the reporting limit of 0.5 µg/L. All detected Sb concentrations were also less than both the LRU of 3.36 µg/L for Sb and the PAL of 5.6 µg/L for Sb in groundwater.

Total Cu was detected in 19 of the 29 groundwater samples analyzed in 2009, with concentrations varying from 0.57 µg/L (estimated) to 30.8 µg/L. Dissolved Cu was detected in 10 of the 17 groundwater samples analyzed, with concentrations varying from 0.56 µg/L

(estimated) to 2.7 µg/L. All detected total and dissolved Cu concentrations were less than both the LRU (310 µg/L) and the PAL (620 µg/L) for Cu in groundwater.

Total Pb was detected in 16 of the 29 groundwater samples analyzed in 2009, with concentrations generally varying from 0.049 µg/L (estimated) to 3.9 µg/L, except for two samples that contained total Pb at concentrations of 11.6 µg/L and 18.3 µg/L. Dissolved Pb was detected in 10 of the 17 groundwater samples analyzed, with concentrations varying from 0.049 µg/L (estimated) to 0.85 µg/L. One groundwater sample (GW1-WL1-GW-01) collected from the Weston Lake supply well contained total Pb at a concentration of 11.6 µg/L, which exceeds the LRU of 7.5 µg/L. Additionally, one groundwater sample (GW1-SB6-WT-GW-01, collected at the water table, an approximate depth of 66 feet bgs or an approximate elevation of 234 feet AMSL) contained total Pb at a concentration of 18.3 µg/L, which exceeds the PAL of 15 µg/L. However, dissolved Pb concentrations for each of these locations (0.64 µg/L for GW1-WL1-GW-01 and below the method detection limit for GW1-SB6-WT-GW-01) and both total and dissolved Pb concentrations in all of the other samples analyzed, were less than both the LRU (7.5 µg/L) and the PAL (15 µg/L) for Pb in groundwater.

Total W was detected in three of the 29 groundwater samples analyzed, with estimated concentrations varying from 0.047 to 0.14 µg/L. Dissolved W was detected in one of the 17 groundwater samples analyzed at an estimated concentration of 0.11 µg/L. No exposure criteria currently exist for W in water; therefore, no LRU or PAL was established for W. All detected total and dissolved W concentrations were less than the reporting limit (1.0 µg/L).

Total Zn was detected in 24 of the 29 groundwater samples analyzed, with concentrations varying from 6.4 to 3,200 µg/L. Dissolved Zn was detected in 16 of the 17 groundwater samples analyzed, with concentrations varying from 22.4 to 3,140 µg/L. Only one interval that was sampled contained Zn above the LRU (2,820 µg/L) for Zn in groundwater. Both total and dissolved Zn exceeded the LRU in samples SB2-40-GW-01 and SB2-40-GW-01-FIL at concentrations of 3,200 µg/L and 3,140 µg/L, respectively. Zn concentrations did not exceed the PAL (4,700 µg/L) for Zn in groundwater at any of the locations sampled.

Discussion – As indicated above, Sb, Cu, and W were present in groundwater samples collected during 2009 but did not exceed either the PAL or LRU in any of the samples collected. Concentrations of total Pb exceeded the LRU in one sample and both the LRU and PAL in another sample. However, for both of these samples, dissolved Pb concentrations were below both the PAL and LRU. Because the exceedances of Pb are rare and localized, and because the accompanying dissolved sample did not exceed either the LRU or PAL, it is unlikely that these results are indicative of groundwater impacted by Pb from munitions. Additionally, research in the region by Landmeyer, et al. (2003) indicates that Pb occurs naturally in the Middendorf aquifer. Because exceedances only occurred when total Pb was measured (which includes suspended sediment), it is likely that these exceedances result from naturally occurring Pb from the formation. For Zn, the exceedances occurred only in one sampled interval from one boring location (in both the total and dissolved samples). Again, because of the very limited extent of these exceedances, it is unlikely that that elevated Zn concentrations within the aquifer result from munitions. Even if the Zn concentrations do result from munitions use, the apparent limited extent of Zn is unlikely to present a risk to receptors.

6.2.3.1.3 **Major Cations and Anions**

Groundwater samples collected in 2009 were analyzed for major cations (calcium, magnesium, and sodium) and major anions (nitrate, chloride, and sulfate) to potentially assist in the identification of groundwater sources. The data did not ultimately prove useful for this purpose. The results of cation and anion analyses are presented in **Table 6-11**. These constituents are not considered MCOC themselves, nor were they analyzed for comparison to regulatory criteria, so PALs were not developed for these constituents.

6.2.3.1.4 **Perchlorate**

The twenty-nine groundwater samples collected in 2009 were submitted for analysis for perchlorate. Analytical results are included as **Table 6-12** and presented in **Figure 6-16.**

Results **-** Perchlorate was detected in samples collected from four intervals at soil boring SB-4, with estimated concentrations varying from 0.14 µg/L in sample GW1-SB4-WT-GW-01 (collected at the first permeable unit below the inferred water table or 118 feet bgs, corresponding to an approximate elevation of 255 feet AMSL) to 0.27 µg/L in sample GW1-SB4-43-GW-02 (collected from an approximate depth of 43 feet below the first permeable interval below the inferred water table or 161 feet bgs, corresponding to an approximate elevation of 212 feet AMSL). Perchlorate was also detected in samples from one depth-discrete sample interval at soil borings SB-2 (GW1-SB2-40-GW-01 collected from an approximate depth of 40 feet below the water table or 108 feet bgs, corresponding to an approximate elevation of 231 feet AMSL) and SB-5 (GW1-SB5-78-GW-01 collected from an approximate depth of 78 feet below the water table or 172 feet bgs, corresponding to an approximate elevation of 189 feet AMSL) at estimated concentrations of 0.12 µg/L and 0.11 µg/L, respectively. As previously discussed in Section 3.1.3.3, the groundwater samples collected from SB-3 and analyzed for perchlorate were not field filtered. Perchlorate was also detected in the sample collected from Weston Lake Well (sample GW1-WL1-GW-01 screened from elevations of 171 to 183 feet AMSL) at a concentration of 0.26 µg/L. Perchlorate concentrations in groundwater samples were all less than both the LRU (9.0 µg/L) and the PAL (15 µg/L) for perchlorate in groundwater.

Discussion **–** Perchlorate was detected in eight of 29 samples from three of the five boring locations and in the supply well at Weston Lake. Although perchlorate was present, the concentrations were very low everywhere it was detected. In every case, the reported concentrations were an order of magnitude below the LRU and two orders of magnitude below the PAL. Although perchlorate is present in groundwater, the concentrations at which it is occurring are unlikely to pose a risk to receptors.

6.2.3.1.5 **Explosives Constituents**

Twenty-nine groundwater samples were collected and submitted for analysis for the full suite of explosives included in method USACHPPM SOP CAD 13.3. Analytical results are presented in **Table 6-12**.

Results **-** RDX was detected in groundwater samples collected in 2009. As indicated in **Table 6-12** and presented in **Figure 6-16**, RDX was detected in groundwater samples from three of the seven sampled intervals at soil boring location SB-3. Estimated RDX concentrations in groundwater samples varied from 0.064 µg/L in sample GW1-SB3-20-GW-01 (collected from an

approximate depth of 20 feet below the identified water table or 82 feet bgs, corresponding to an approximate elevation of 248 feet AMSL) to 0.17 µg/L in sample GW1-SB3-73-GW-02 (collected from an approximate depth of 73 feet below the identified water table or 135 feet bgs, corresponding to an approximate elevation of 195 feet AMSL). RDX concentrations were below the PAL for RDX (0.61 µg/L) but exceeded the LRU for RDX (0.10 µg/L) in groundwater in three samples.

Discussion – As indicated, RDX was detected in groundwater over an approximately 60 feet thick interval within the aquifer that is utilized downgradient for drinking water. Although the concentrations were below the PAL, they were above the LRU. Additionally, the drilling and sampling method utilized to collect the samples may have been prone to diluting MCOC in the aquifer due to the addition of water during the drilling process. Although procedures were utilized to limit the effects of drilling fluids, the RDX concentrations should be considered to represent the minimum concentrations present within the intervals sampled. As previously discussed, these samples were collected from temporary wells that were removed in order to advance the borehole further. As such, these locations were unable to be resampled.

6.2.3.2 2012 & 2013 Assessment

At the end of the 2009 phase of the groundwater assessment, the full suite of groundwater data collected was evaluated. Based upon this assessment and discussions with the larger Army team, the evaluation of metals and perchlorate in groundwater was considered to be complete. The conclusions for these MCOC are presented below.

For explosives in groundwater, the data collected in 2009 was not considered sufficient to draw a conclusion regarding whether RDX in groundwater posed a potential risk to receptors. In order to further evaluate whether RDX posed a potential risk to receptors downgradient of the groundwater assessment area, six monitoring well pairs were installed. Groundwater samples were collected three times over the course of a year (July and October 2012, and February 2013).

Based on guidance received from the Army during preparation of the technical approach for this additional assessment, U and U isotopes were added to the list of potential MCOC in groundwater, and thus were included in the analytical suite for groundwater.

The results of the laboratory analysis of samples collected in 2012 and 2013 are presented and discussed below.

6.2.3.2.1 **Groundwater Quality Measurements**

Groundwater quality measurements were recorded during development of the monitoring well pairs and during sampling activities. For the samples collected as part of the 2012 and 2013 phase of the groundwater assessment, the water quality parameters measured included pH, specific conductance, turbidity, DO, and ORP. All measurements were noted on field sheets and/or in field notes and are included in **Appendix D**. After collection of the samples from the sampler, the stabilized in-situ water quality measurements were recorded as well. These measurements have been compiled and are included as **Table 6-13**.

pH measurements recorded during the 2012 and 2013 sampling events varied from 4.41 to 9.52 with measurements generally more variable than during the 2009 sampling. Measurements from

14 of the 36 samples collected were above 7.0, including all of the measurements from MW-RS-02D, MW-RS-03S and MW-RS-07D, two of the three measurements from MW-RS-02S and MW-RS-05S, and one measurement from MW-RS-05D. Specific conductance measurements recorded during the 2012 and 2013 sampling range from 0.011 mS/cm to 0.169 mS/cm. DO measurements recorded during the 2012 and 2013 sampling ranged from 0.05 mg/L to 9.29 mg/L. ORP measurements recorded during the 2012 and 2013 sampling were similarly variable to those collected in 2009 with values ranging from -310.2 mV to 225.8 mV.

6.2.3.2.2 **MCOC Metals**

As previously indicated, based upon an evaluation of MCOC metals data collected as part of the 2009 sampling, groundwater samples collected in 2012 and 2013 were not analyzed for Sb, Cu, Pb, W, and Zn. Groundwater samples were analyzed for total dissolved U and dissolved isotopic-U. Dissolved U concentrations and the concentrations of U-isotopes were measured in groundwater samples collected from the monitoring well pairs installed in 2012. Results for each of the sampling events completed in July and October 2012, and February 2013 are shown in **Tables 6-14**, **6-15**, and **6-16**; respectively.

Results – Dissolved U was detected only in one sample collected in July 2012 and was not detected in any of the samples collected during the October 2012 or February 2013 sampling events. U was detected at an estimated concentration of 0.46 µg/L in the sample collected from MW-RS-02D in July 2012. Isotopic analysis shows that the U that was detected was present entirely as U-238. The level at which U was detected in groundwater is two orders of magnitude below the PAL of 30.0 µg/L for U in groundwater.

Discussion – In general the evaluation of U data collected as part of ORA Phase II Assessment is a two-step process. First the concentration of U is compared to the PAL. If the U concentration exceeds the PAL, the isotopic-U data is evaluated to determine if the U present is sourced from DU. The uranium enrichment process used to create DU reduces the percentage of U-234 and U-235 relative to U-238 (USEPA, 2006b); therefore, samples containing DU would be expected to have higher concentrations of U-238 (relative to the concentrations of U-234 and U-235) than samples containing naturally occurring uranium.

U was detected only in one groundwater sample at a concentration two orders of magnitude below the PAL. As such, no further evaluation of the data is warranted. Although the concentration of U-238 exceeds the concentrations of the other U-isotopes, the concentration is so low that the source of the U cannot be conclusively indicated.

6.2.3.2.3 **Explosives Constituents**

A total of 12 samples were collected during each of the three sampling events completed in July and October 2012 and February 2013. The laboratory analytical results are included in in **Tables 6-14**, **6-15**, and **6-16**; respectively.

Results – Two or more explosive compounds were detected during each of the three sampling events completed as part of the 2012 and 2013 assessment of the groundwater pathway at Fort Jackson and McCrady Training Center. A summary of these results is included below.

Two explosives analytes were detected in groundwater samples collected from the monitoring wells pairs in July 2012. 1,3,5-Trinitrobenzene was detected in the duplicate sample (but not the primary sample) collected from MW-RS-05D at an estimated concentration of 0.14 µg/L, well below the groundwater PAL of 460 µg/L. RDX was detected in seven of the 12 samples collected in July 2012 (the duplicate at MW-RS-02D and samples MW-RS-03D, MW-RS-04S, MW-RS-04D, MW-RS-05D, MW-RS-06D, and MW-RS-07S). As shown in **Table 6-14** and **Figure 6-17**, RDX concentrations ranged from an estimated concentration of 0.13 µg/L to a concentration of 0.76 µg/L. Concentrations of RDX exceeded the groundwater PAL of 0.61 µg/L at two locations (MW-RS-04D and MW-RS-06D).

Three explosives analytes were detected in groundwater samples collected from the monitoring wells pairs in October 2012. 2,4,6-TNT was present in two samples collected from the MW-RS-03 location in both the shallow and deep wells at concentrations of 0.11 µg/L and 0.064 µg/L (estimated), respectively. Both values are significantly lower than the PAL of 460 µg/L. 4-Nitrotoluene was detected in one sample (MW-RS-03S) at an estimated concentration of 0.15 µg/L. The PAL for 4-nitrotoluene is 3.7 µg/L. RDX was present in four of the samples collected in October 2012 (samples MW-RS-04D, MW-RS-05D, MW-RS-06D, and MW-RS-07S). As shown in **Table 6-15** and**Figure 6-18**, RDX concentrations ranged from 0.19 µg/L to 0.78 µg/L. Concentrations of RDX exceeded the groundwater PAL of 0.61 µg/L at two locations (MW-RS-04D and MW-RS-06D).

Five explosives analytes were detected in groundwater samples collected from the monitoring well pairs in February 2013. 1,3-DNB was detected at a concentration of 0.11 µg/L at location MW-RS-07D, below the groundwater PAL of 1.5 µg/L. 2,4,6-TNT was present in one sample (MW-RS-02D) at an estimated concentration of 0.18 µg/L, below the PAL of 2.2 µg/L. 2-Amino-4,6-DNT was detected in sample MW-RS-03D at an estimated concentration of 0.14 µg/L (PAL is 30 µg/L). HMX was present in one sample (MW-RS-05D) at an estimated concentration of 0.037 µg/L (PAL is 780 µg/L). Finally, RDX was present in six of the samples collected in February 2013 (samples MW-RS-03D, MW-RS-04S, MW-RS-04D, MW-RS-05D, MW-RS-06D, and MW-RS-07S). As shown in **Table 6-16** and **Figure 6-19**, RDX concentrations ranged from 0.11 µg/L (estimated) to 0.68 µg/L. RDX exceeded the PAL in two of the samples analyzed (MW-RS-04D and MW-RS-06D).

It is important to note that the PAL for RDX is a USEPA Integrated Risk Information System screening value and not an enforceable federal standard. A 2.0 µg/L value is listed by the USEPA as a lifetime health advisory level, which is also not an enforceable standard. All RDX concentrations detected downgradient of the groundwater assessment area and other assessment areas were below this lifetime health advisory level.

Discussion – Multiple explosives analytes were detected in groundwater during each of the sampling events. However, only RDX occurred consistently at similar concentrations at the locations and intervals in which it was identified. In particular, RDX concentrations exceeded the groundwater PAL in samples collected from MW-RS-04D and MW-RS-06D during all three rounds of sampling. These results indicate that RDX from operational range sources has reached groundwater. However, uncertainty remains regarding whether RDX is migrating off the range footprint at concentrations of concern to human receptors.

6.3 Uncertainty

6.3.1 Data Validation Results

Data validation results are presented in **Appendix G**. The data qualifiers used to qualify the analytical results associated with QC parameters outside of the established DQOs are defined below:

- J The analyte was positively identified; however, the result should be considered an estimated value.
- UJ The reporting limit is considered an estimated value.
- R QC indicates that the data are not usable.

Results qualified as "J" or "UJ" are of acceptable data quality and may be used quantitatively to fulfill the objectives of the analytical program, per USEPA guidelines. Results that required qualification based on the data validation are summarized in Table G-1, **Appendix G**.

6.3.2 Completeness

Technical completeness was calculated for this project by the following equation:

$$\%\ \text{Technical Completeness} = \left(\frac{\text{Number of usable results}}{\text{Number of reported results}}\right) \times 100$$

As specified in the QAPP, the DQO goal for percent technical completeness is 95% for each combination of matrix and analysis. All data were usable; therefore, the technical completeness was 100% for all matrices and analyses. The results were considered usable for the intended purposes, and the project DQOs have been met.

6.3.3 Analysis

Statistical Comparisons to Reference

The small size of the Phase II assessment data sets (four samples per location for surface water and three samples per location for sediment) reduces the ability of statistical hypothesis tests (t-test and Wilcoxon) to reject the null hypothesis of no difference between reference and downstream locations. The statistical tests' limitations were exacerbated where the data were not normally distributed or where the results for more than one sampling event were nondetections reported at the reporting limit. When 50% or more of the values are nondetections, statistical tests have little power to detect differences in mean values (Helsel and Hirsch, 2002). This statistical limitation produced false negative errors in the initial comparison of downstream and reference MCOC concentrations. The potential for false negative errors was mitigated by the decision to supplement the statistical hypothesis tests with a direct comparison of reference and downstream concentrations, as discussed in Section 5.3.1.

95% UCLM Greater than Maximum Observation

The 95% UCLMs were calculated in accordance with the USEPA guidance documents on computing 95% UCLMs and the USACHPPM Phase II protocol (USACHPPM, 2009; USEPA,

2002a, 2002b, and 2009). The USEPA guidance documents caution against attempting tests with 95% UCLM when a sampling location data set is small (n < 5) or when the number of detected values is zero or small (*e.g.*, one or two). Each of these cases occurs in the data collected for this study. All downstream sample location data sets contain four or fewer samples, and non-detections were common. One of the concerns with small data sets such as those collected for this study is that the 95% UCLM can often be greater than the maximum observed value. This was the case for all 17 of the 95% UCLM values calculated for MCOC in sediment and for five of the 11 95% UCLM values calculated for MCOC in surface water. In the case of Zn in sediment at GC2, the maximum detected concentration of 122 mg/kg was less than the PAL of 150 mg/kg; however, the 95% UCLM calculated for Zn in sediment at GC2 was 151.4 mg/kg, which is greater than the PAL. Use of the 95% UCLM, even where the 95% UCLM is greater than the maximum observation, is an environmentally conservative approach because it decreases the possibility of a false negative error of finding no unacceptable risk to human or ecological receptors when an unacceptable risk actually exists.

Lack of Tungsten PALs

There is no PAL for W in surface water, as no regulatory limits currently exists. As noted in Section 6.1.1.4, a review of the toxicity of W by USACHPPM (2004) suggests that if surface water criteria for W were developed they might be on the order of 35 to 175 µg/L. While these values cannot be used as a decision point for determining risk to receptors since they are not established regulatory criteria, a comparison shows that W detected in the surface water samples is several orders of magnitude below these values. The lack of PALs for W does affect the ability of the Phase II assessment to draw conclusions for W based on established regulatory screening criteria and PALs; however, review of the data indicates that W was detected at concentrations well below the preliminary toxicity values.

6.3.4 Field Modifications

Nonfiltered Perchlorate Samples

Groundwater samples collected from SB-3 were not filtered in the field during collection. Filtering generally is done to prevent microbial degradation of perchlorate during sample shipment. Headspace is also left in the containers to maintain aerobic conditions in the sample. Although the groundwater samples from SB-3 were not filtered, headspace was left in each of the containers submitted for perchlorate analysis. With the headspace, aerobic conditions likely were maintained up to the time of sample analysis, and microbial (anaerobic) degradation of perchlorate would have been slowed in the samples. While the degree of influence of filtering is not known, the effect of leaving headspace in the sample provided conditions that would have limited degradation of the perchlorate. As such, the lack of filtering is not anticipated to have affected the perchlorate data (*i.e.*, bias the perchlorate concentrations lower than if the sample had been filtered). The lack of filtering of perchlorate samples at SB-3 did not impact groundwater recommendations.

Results from Reference Location CC2

At the reference location CC2 in the Colonels Creek watershed, only three surface water samples could be collected and several MCOC were detected at concentrations greater than the PALs. The results at CC2 have changed the understanding of potential sources upstream of that

location. Specifically, all operational ranges upstream of CC2 were grouped as Limited Source in the Phase I assessments for having limited potential MCOC sources. The sampling results indicate that CC2 had some of the highest MCOC concentrations in the Colonels Creek watershed and the only detection of a USEPA Method 8095 analyte (DNB in sediment). Historical maps and range information were reviewed again to determine if any potential sources had been overlooked in the Phase I assessments and Phase II planning process, but no such sources were found. This uncertainty does not affect the conclusions of the Phase II assessment.

20-Hour Composite Samples

As discussed in Section 3, surface water samples for the Wet A, Wet B, and Dry A sampling events were intended to be 24-hour time composites with sample aliquots collected every 15 minutes. Some samples (location CC2 during Wet A and locations CC1, CC2, CC3, and JC1 during Wet B) were collected over 20 hours rather than 24 hours due to autosampler rechargeable battery failure. This minor deviation from the Work Plan was discussed among the ARCADIS surface water team and with USACHPPM, who provided on-site technical oversight during these two events. The samples were determined to be adequate to meet the project objectives since the goal of the wet season sampling was to characterize seasonal conditions and the slightly shorter collection period would not affect data quality or usability. The 20-hour samples do not influence the confidence in findings.

Different Sampling Locations for Wet A versus Dry A and Dry B Events at WL2

The level of water in Weston Lake decreased between the Wet A event in March and the Dry A and Dry B events in July. With the decrease in the lake level, the sampling location for WL2, which was selected during the Wet A event, was not accessible by boat during the Dry A and Dry B events. For these dry season events, the sampling location for WL2 was shifted to the west by approximately 250 feet. While both sampling locations for WL2 (and also WL1) are within the footprint of a site currently being investigated under the MMRP, the dry events location was closer, and possibly within, the former target area for a small arms range. The Wet A location for WL2 and the wet/dry location for WL1 are located within the former safety fan associated with the small arms range. The concentrations reported for the sample obtained from WL2 during the Dry A and Dry B events are greater than those reported for the sample obtained from WL2 during the Wet A event. Additionally, the MCOC detected (metals) are more typical of small arms range use. This uncertainty affects the conclusions of the Phase II assessment by identifying potential additional sources not associated with the operational range areas evaluated under ORA (*i.e.*, non-operational areas evaluated under the MMRP).

UJ - not-detected; RL is estimated

Q - data qualifier
MDL - Method Detection Limit
RL - Method Reporting Limit

EPA - Environmental Protection Agency
CHPPM CAD - Center for Health Promotion and Preventive Medicine Chromatographic Analysis Division

Footnotes:
a The MDLs and RLs listed apply to all samples except those listed in footnotes b and d
b The MDLs and RLs in parentheses for lead apply to STRM-WL1-SW-01, STRM-WL2-SW-01, STRM-WL2-SW-02, WETB-WL2-SW-01
d The MDL in parentheses apply for Calcium to WETA-, WETB-WL2-SW-01
e Hardness, mg equivalents/L CaCO3 = [(Ca, mg/L / 20.04 mg/meq) + (Mg, mg/L / 12.16 mg/meq)] * 50.05 mg/meq CaCO3
f Detection was qualified with 'U' and RL was raised to detection (See Appendix G).

Notes:

Non-detected values are reported at the Limit of Detection (LOD)
Detected results are shown in **bold text**
Data exceeding the GW PAL are shaded
Field duplicate results are shown in brackets [ ]

Qualifier Definitions:

Inorganic	
B	Indicates an estimated value between the instrument detection limit and the reporting limit (RL).
U	The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
UB	Analyte considered non-detect at the listed value due to associated blank contamination.
Organic (Explosives)	
J	Indicates an estimated value.
JN	The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
U	The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

U	The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
UB	Analyte considered non-detect at the listed value due to associated blank contamination.

Organic (Explosives)

J	Indicates an estimated value.
JN	The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
U	The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

Project Action Limits (PALs)			
Analyte	Human Health PAL (SW) (µg/L)	Ecological PAL (SW) (µg/L)	PAL (SD) (mg/kg)
Antimony (Sb)	5.6	30	12
Copper (Cu)	620	2.7	34
Lead (Pb)	15	0.54	47
Tungsten (W)	--	--	--
Zinc (Zn)	4,700	36	150

Values in **orange** exceed the Human Health PAL (SW)
Values in **green** exceed the Ecological PAL (SW)
Values in **red** exceed both SW PALs
Values in **blue** exceed SD PAL
All SW results are in µg/L
All SD results are in mg/kg
ND = Concentration below detection limit

GC1		
Analyte	Result	
	SW	SD
Sb	0.022 - 0.08	ND - ND
Cu	0.41 - 1.62	0.25 - 0.6
Pb	0.054 - 0.2	0.41 - 3.2
W	ND - ND	ND - ND
Zn	1.62 - 5.1	ND - 1.1

GC2		
Analyte	Result	
	SW	SD
Sb	0.223 - 0.32	0.19 - 1.6
Cu	2.41 - **3.19**	10.4 - **36.9**
Pb	**1.72 - 3.28**	35.6 - **144**
W	0.006 - 0.02	0.15 - 2.3
Zn	6.07 - 11.5	31.6 - 122
