Notes:
1. Analyte detections shown represent all explosive and perchlorate detections, and only dissolved metals that are greater than either the Project Action Limit (PAL) or Lower Range of Uncertainty (LRU). Blue text indicates detections greater than the PAL. Green text indicates detection greater than the LRU.
2. The total lead value of 18.3J µg/L is greater than the PAL of 15 µg/L , however, dissolved lead was not detected at this sample interval.
3. The total lead value of 11.6 J µg/L is greater than the LRU of 7.5 µg/L, however, duplicate samples collected at this interval are less than the LRU for both the total and dissolved lead with results of 3.9J µg/L and 0.64 µg/L, respectively.

ClO_4 = Perchlorate, Dup = Duplicate Sample result, Pb = Lead, RDX = Cyclotrimethylenetrinitramine

7 Risk Assessments

As discussed in Section 6, screening level risk assessments were performed to evaluate the likelihood of off-range MCOC migration that could pose an unacceptable risk to potential ecological receptors via surface water and sediment and to potential human receptors via groundwater. The SLERA, which evaluated the potential risk to ecological receptors in in the Gills Creek watershed, is presented in **Appendix I** and discussed below in Section 7.1, while the HHRE, which evaluated the potential risk to human receptors using groundwater as a potable source, is presented in **Appendix J** and discussed below in Section 7.2.

7.1 SLERA

Threatened and Endangered Species and Critical Habitats

Based on information in the Fort Jackson's Integrated Natural Resources Management Plan (Gene Stout & Associates, 2004) and a current SCDNR list of rare, threatened, and endangered species and communities known to occur in Richland County (accessed online at: http://www.dnr.sc.gov/species/), there are several species of state and/or federally listed threatened or endangered species at Fort Jackson and McCrady Training Center. These include: three federally-listed endangered terrestrial plant species [*i.e.*, rough-leaved yellow loosestrife (*Lysimachia asperulaefolia*), Canby's dropwort (*Oxypolis canbyi*), and smooth purple coneflower (*Echinacea laevigata*)], the federally and state endangered red-cockaded woodpecker (*Picoides borealis*), the state endangered Rafinesque's big-eared bat (*Corynorhinus rafinesquii*), and the state threatened bald eagle (*Haliaeetus leucocephalus*).

Of these, the bald eagle is the only species that may potentially be exposed to surface water and sediment in the Gills Creek watershed, feeding mainly on fish. In 2004, there were 190 nesting pairs and 481 individuals counted mid-winter in the state of South Carolina (SCDNR, 2013). However, the bald eagle is only a transient visitor to Fort Jackson and McCrady Training Center and no nests or permanent roost sites are known to occur on the installation (Gene Stout & Associates, 2004). According to the U.S. Fish and Wildlife Service, the federally listed endangered red-cockaded woodpecker rarely comes to the ground surface and even bathes in water-filled depressions on tree limbs (2005). A study of red-cockaded woodpecker foraging behavior in South Carolina found the birds drinking water from water-filled depressions on trees, dew-covered leaves, and puddles on the ground. No observations have been made of the birds drinking from flowing streams or ditches (Hooper and Lennartz, 1981). In addition, the federally-endangered shortnose sturgeon may be found in the vicinity of Fort Jackson and McCrady Training Center, but is not known to occur at the installation.

Exposure Pathways

Potential aquatic or semi-aquatic receptors associated with Gills Creek and any water bodies and associated freshwater forested wetlands off-range include plants, benthic and aquatic invertebrates, reptiles and amphibians, fish, small mammals, wading birds, and piscivorous birds. Benthic and aquatic invertebrates and fish may be exposed to MCOC in sediment or surface

water through direct contact (*e.g.*, absorption or assimilation). Aquatic plants may be exposed to MCOC through the dissolution of chemicals in surface water and subsequent assimilation by plant roots. Small mammals, wading birds, and piscivorous birds may be exposed through the ingestion of MCOC in surface water (either incidentally during feeding or directly). Exposure to MCOC in sediment may also occur through incidental ingestion of sediment suspended in the water column or because of preening activities. Lastly, fish, small mammals, wading birds, and piscivorous birds may be exposed to MCOC in surface water and sediment through the food web; this exposure pathway is of special concern for chemicals that have the potential to bioaccumulate. Direct ingestion of Pb fragments (*e.g.*, grit ingestion by birds) is considered an incomplete pathway, as no bullets, bullet fragments, or casings were found in the stream channels at the ORA Phase II Assessment sampling locations.

SLERA Conclusions

Based on the evaluation presented in the SLERA, a potential for adverse health effects in aquatic life is indicated from exposure to Cu and Pb in surface water in Gills Creek at the operational range boundary (GC2) and a more thorough assessment may be warranted because the metals may settle out and/or be diluted in Boyden Arbor Pond before the water flows off-installation.

For sediment, the maximum detected concentrations of copper and lead at the operational range boundary are within the range of available chronic Toxicity Reference Values (*i.e.*, lower than the highest chronic Toxicity Reference Value for copper and lead in sediment). This indicates that the potential for adverse ecological health effects from exposure to sediment in Gills Creek at the operational range boundary is likely low. However, based on the low pH in surface water and low TOC in sediment, these metals may become mobile and bioavailable. While significant sediment accumulation occurs where Gills Creek enters Boyden Arbor Pond and in the center of Boyden Arbor Pond where another tributary enters, the extent to which sediment transport may occur from the pond downstream of the operational range is unknown. Therefore, there is not adequate information to fully assess ecological risk and further assessment may be warranted.

7.2 HHRE

An initial quantitative data screening was conducted using groundwater analytical data collected as part of this assessment. Analytical data for metals (Sb, Cu, Pb, and Zn), perchlorate, and explosives from samples collected in 2009 were utilized as part of this initial screening. The total cumulative risk factor for groundwater was calculated to be 2, with Pb and Zn being the predominant contributors. However, based upon these 2009 data it was determined it is unlikely that Pb and Zn in groundwater pose a risk to potential down-gradient off-range receptors because:

- Pb concentrations in the dissolved sample from the same location where the PAL exceedance occurred are significantly lower and below the LRU.
- Zn was detected above the LRU in total and dissolved samples from only one location; all other samples had significantly lower Zn concentrations.

- These metals are naturally occurring and concentrations of Pb are comparable with those found elsewhere within the Middendorf formation, as discussed in Section 6.2.3.1.2 .

Therefore, metals were not considered MCOC during additional groundwater investigation. Perchlorate also was not considered a MCOC during additional groundwater investigation because it was detected at concentrations orders of magnitude lower than the PAL.

Additional groundwater assessment was deemed necessary to evaluate RDX concentrations that may have been biased low. Monitoring well clusters were installed in 2012 and sampled in 2012 and 2013 for explosives. Additionally, samples were analyzed for U and U-isotopes due to the concern that DU-containing munitions were used at Fort Jackson and McCrady Training Center. U and U-isotopes were not detected in the additional groundwater samples collected and analyzed in 2012 and 2013. As previously discussed, RDX was identified in these groundwater samples at concentrations that exceeded the PAL. Based upon these results, RDX concentrations were further evaluated as part of the HHRE. This is described in more detail in the following paragraphs.

Potential groundwater receptors down-gradient of Fort Jackson and McCrady Training Center are limited to users (*i.e.*, workers and residents) of potable water supplied from residential or public supply wells. The results of a well search indicate residential and public supply wells down-gradient to the west, south, and east of Fort Jackson and McCrady Training Center. A windshield survey also indicated the likely presence of additional residential wells in the area. The monitoring wells installed during the additional investigation and sampled in 2012 and 2013 are screened generally within intervals where residential wells are also screened, based on review of well construction details for residential wells. RDX was the only MCOC detected in down-gradient monitoring wells (MW-RS-4D and MW-RS-6D on Figure 6-17 through Figure 6-19) at concentrations above PAL.

Excess lifetime cancer risks and noncancer hazards were estimated for resident adults and children, using conservative exposure parameters and maximum detected MCOC concentrations from samples collected in 2012 and 2013 from on-range monitoring wells installed during the additional investigation. The estimated excess lifetime cancer risks (*i.e.*, 1×10^{-6} or 1 in 1,000,000 and 8×10^{-7} or 8 in 10,000,000 for adult and child residents, respectively) were below the upper end of the acceptable risk range established by the National Contingency Plan (*i.e.*, 1×10^{-4}) (USEPA, 1990). The estimated noncancer hazards (*i.e.*, 0.005 and 0.02 for adult and child residents, respectively) were below acceptable hazard index of 1. Therefore, based on existing data obtained from the on-installation wells, potential exposure of down-gradient potable water users to MCOC in groundwater at Fort Jackson is unlikely to result in unacceptable health risks. It is important to note that the data collected to date was not intended to fully characterize subsurface conditions within the operational range or downgradient of the operational range and installation boundary.

Page Intentionally Left Blank

8 Summary of Findings and Conclusions

The Phase II analytical data and supporting observations indicate that MCOC are migrating downstream from Fort Jackson and McCrady Training Center operational range areas via the surface water system in the Gills Creek watershed. However there are no data to confirm whether MCOC are leaving the operational range at concentrations that present an unacceptable risk to off-range human or ecological receptors. Data collected within the Colonels Creek and Cedar Creek watersheds indicate that MCOC are not migrating via the surface water pathway at concentrations that present an unacceptable risk to off-range human or ecological receptors. Groundwater sampling data indicate explosives MCOC (RDX) are present at concentrations that exceed the PAL immediately downgradient from the groundwater assessment area and within the operational range footprint.

Within the Gills Creek watershed:

- Metals MCOC (Cu and Pb) migration is occurring via Gills Creek surface water and sediment at concentrations that may pose an unacceptable risk to ecological receptors downstream of the operational areas. There is a potential for metals MCOC to migrate off-range at levels that may pose an unacceptable risk to ecological receptors downstream of the operational range boundary. However, uncertainty remains regarding the actual concentrations of these metals MCOC in Gills Creek downstream of the operational range area. Metals MCOC are not considered to pose an unacceptable risk to human receptors. Explosives and propellants MCOC are not migrating via surface water or sediment at concentrations that pose an unacceptable risk to ecological or human receptors.

- Groundwater is not considered to be a viable pathway for the transport of metals MCOC. Previous investigations indicated that shallow groundwater may be locally impacted by metals MCOC in areas where clay layers that inhibit MCOC migration to groundwater are absent. However, shallow groundwater likely discharges to adjacent streams before leaving the installation or entering the deeper flow system.

Within the Colonels Creek watershed:

- MCOC are not migrating via surface water or sediment at concentrations that pose an unacceptable risk to ecological or human receptors.

- The potential for MCOC to migrate to groundwater within this watershed was evaluated as part of the investigation of the groundwater assessment area (see below).

Within the Cedar Creek watershed:

- MCOC from operational ranges are not migrating via surface water or sediment at concentrations that pose an unacceptable risk to ecological or human receptors. Although Cu and Pb concentrations in sediment exceeded their respective PALs at location WL2,

the area of Weston Lake where WL2 is located is within the site boundary of a MMRP site; further evaluation of Pb and Cu at this site will be addressed as part of studies conducted under the MMRP.

- The potential for MCOC to migrate to groundwater within this watershed was evaluated as part of the investigation of the groundwater assessment area.

Within the groundwater assessment area where the groundwater wells were installed and sampled:

- One explosive MCOC (RDX) was identified in groundwater downgradient of the groundwater assessment area at concentrations above the human health PAL. The risk to human receptors is not known because the RDX concentrations in groundwater off-installation, where it is utilized as a drinking water source, were not evaluated as part of this study.

The discussion below summarizes the information used to make these determinations for each of the assessment areas (i.e., watersheds and groundwater assessment area). MCOC groups (i.e. metals, explosives, and perchlorate) are discussed separately by assessment area.

8.1 Surface Water System Investigation

As previously discussed, surface water samples were analyzed for metals and explosives MCOC and perchlorate. Sediment samples were analyzed for metals and explosives MCOC. A summary of findings for each watershed and MCOC type are presented below.

8.1.1 Gills Creek Watershed

8.1.1.1 Metals MCOC

The following findings suggest that metals MCOC could potentially migrate off-range via surface water or sediment and pose a potential risk to ecological receptors in the Gills Creek watershed:

- Small arms use is heavily concentrated within this watershed. The ranges within this assessment area are heavily used throughout the year and have a long history of being used for live fire training. The ranges are located in close proximity to streams with low levels of hardness (less than 25 mg/L), which typically increases the ecological toxicity of dissolved MCOC metals. The small arms ranges and non-dudded impact area are dissected by surface water features and, in many cases, are in very close proximity to streams.
- Pb was detected in all of the downstream (GC2) surface water samples at concentrations nearly an order of magnitude or more above the ecological PAL. The lowest Pb concentration measured at GC2 was nearly an order of magnitude greater than the highest Pb concentrations measured at the reference location GC1.

- Pb was detected above the ecological PAL in two of the five sediment samples collected at GC2. Every sample collected from GC2 contained Pb at a concentration that was more than one order of magnitude greater than the highest Pb concentration measured at reference location GC1.
- Cu was detected in two of the five downstream (GC2) surface water samples above the ecological PAL for chronic exposure. Each of the Cu results at GC2 was greater than any of the results from the reference location GC1.
- Cu was detected in one of the five downstream (GC2) sediment samples above the ecological PAL. Each of the Cu results at GC2 was nearly two orders of magnitude greater than any of the results from the reference location GC1.
- The statistical analysis demonstrates that downstream (GC2) Pb and Cu concentrations in surface water and sediment in the Gills Creek watershed are statistically higher than reference levels and, in some cases, the ecological PALs.
- None of the other MCOC metals in surface water and sediment exceeded the ecological or human health PALs in the surface water and sediment samples collected within the Gills Creek watershed.
- Habitat for South Carolina species of concern and sensitive environments has been identified in the areas surrounding Fort Jackson and McCrady Training Center and may be present within the non-operational portions of the installation downstream of the operational ranges associated with the Gills Creek watershed.
- The SLERA concluded that there is a potential for adverse health effects in aquatic life from exposure to Cu and Pb in the surface water of Gills Creek at the downstream sampling location (GC2) 100 feet upstream of the operational range boundary.
- Although the results of previous studies (Bricka, 2002 & USATC, 2005) indicated that metals from the Gills Creek watershed were not leaving the installation at elevated concentrations, the detection limits in those studies were above the PAL and therefore the data cannot be used as part of this assessment.

Given multiple detections of MCOC metals in surface water and sediment at concentrations exceeding PALs at the downstream sampling location (approximately 100 feet upstream of the operational range boundary), there is a potential for MCOC metals to migrate off-range at levels that may pose an unacceptable risk to ecological receptors downstream of the operational range boundary.

For all of the Phase II samples collected from Gills Creek, the concentration of metals MCOC were below the human health screening criteria for surface water. Additionally, surface waters within the Gills Creek watershed have not been identified as a source of drinking water. Therefore, metals MCOC are unlikely to pose an unacceptable risk to off-range human receptors downstream of operational areas in the Gills Creek watershed.

These conclusions for both human and ecological receptors are supported by the repeatability of data demonstrated by the multiple sampling events in different media and seasons, the inherent

conservativeness of the PALs established for this assessment, and by the conclusions of the statistical evaluation and, for ecological receptors, the SLERA. Although previous investigations identified shallow groundwater in this area as being impacted by metals MCOC, available information suggests that shallow groundwater is most likely to discharge to nearby streams and creeks before leaving the operational range areas rather than to migrate downward to deeper groundwater that flows off-range.

8.1.1.2 Explosives MCOC and Perchlorate

Neither explosives nor perchlorate was detected in the surface water and sediment samples collected under various stream conditions. Based up these results, neither explosives MCOC nor perchlorate is migrating off-range at levels that pose an unacceptable risk to human or ecological receptors.

8.1.2 Colonels Creek Watershed

8.1.2.1 Metals MCOC

The following findings indicate that metals MCOC are unlikely to migrate downstream of operational range areas within the Colonels Creek watershed at concentrations that pose an unacceptable risk to off-range human and ecological receptors:

- Small arms are utilized in this area. However, firing into berms or other concentrated source areas is generally limited. Where concentrated firing does occur, the locations are generally separated from streams by significant areas with vegetative cover.
- Although Pb concentrations in surface water and sediment exceeded the ecological PAL at CC2 (reference location), results 60 feet upstream of the operational range and installation boundary (CC3) were all below the ecological PAL and only slightly higher than at the reference location CC1. This indicates that Pb concentrations detected in surface water and sediment at CC2 are attenuated at the range boundary to concentrations that do not present an unacceptable risk to off-range human or ecological receptors.
- At JC1, located on Jumping Creek 100 feet upstream of the operational range and installation boundaries, metals MCOC were detected at concentrations below ecological and human health PALs and were generally consistent with reference levels at reference location CC1 and below reference levels at CC2.
- None of the other MCOC metals in surface water and sediment exceeded the ecological or human health PALs in the surface water and sediment samples collected within the Colonels Creek watershed.
- The benthic macroinvertebrate sampling results indicate that species diversity values were generally similar in the downstream (JC1 and CC3) sampling locations to those in the upstream reference (CC1) sampling location, indicating that stream habitat conditions downstream of the operational ranges have not been degraded.
- Colonels Creek has not been identified as a source of drinking water.

Detected concentrations of MCOC metals exceeded ecological PALs for Pb in sediment and surface water at the reference location CC2; however, all detected concentrations of metals MCOC were below the ecological and human health PALs at the operational range boundary sampling locations (CC3 and JC1). Therefore, concentrations of MCOC metals leaving the operational range are unlikely to pose an unacceptable risk to human or ecological receptors. This conclusion is supported by the repeatability of data demonstrated by the multiple sampling events in different seasons, the inherent conservativeness of the PALs established for this assessment, and the observed site conditions that naturally mitigate MCOC migration.

8.1.2.2 Explosives MCOC and Perchlorate

The following findings indicate that explosives MCOC and perchlorate are unlikely to migrate downstream from operational range areas within the Colonels Creek watershed at concentrations that pose an unacceptable risk to off-range human and ecological receptors:

- The only sediment sample with detectable concentrations of explosives was located more than four stream miles upstream from the combined operational range boundary (location CC2). No explosives were detected in any of the other sediment or surface water samples, including those at the downstream installation boundary, collected within the Colonels Creek watershed.
- Although perchlorate was detected in two of the samples collected from the McCrady Training Center southern installation boundary (at downstream location JC1), the concentrations were two orders of magnitude below the PAL.
- Although training does occur within the limits of the Colonels Creek watershed, most of the firing is directed toward an impact area located within the Cedar Creek watershed.
- Colonels Creek has not been identified as a source of drinking water.

One explosive (DNB) was detected in sediment at the upgradient location CC2 above the PAL within Colonels Creek. However, sediment and surface water samples collected at the downstream location near the operational range and installation boundary (CC3) did not contain detectable concentrations of explosives. Perchlorate was detected at a concentration well below the PAL at the downstream location in Jumping Run Creek (JC1) 100 feet upstream of the operational range and installation boundary. Therefore, within the Colonels Creek surface water system, explosives MCOC and perchlorate are unlikely to pose an unacceptable risk to off-range human or ecological receptors. This conclusion is supported by the repeatability of data demonstrated by the multiple sampling events in different seasons, the inherent conservativeness of the PALs established for this project, and the observed site conditions that naturally mitigate MCOC migration.

8.1.3 Cedar Creek Watershed

8.1.3.1 Metals MCOC

The following findings indicate that metals MCOC are unlikely to migrate downstream of operational range areas at concentrations that pose an unacceptable risk to off-range human and ecological receptors within the Cedar Creek watershed:

- Small arms are utilized in this area. However, firing into berms or other concentrated source areas is generally limited. Where concentrated firing does occur, the locations are generally separated from streams by areas with good vegetative cover.
- No MCOC metals exceeded any of the PALs in surface water samples collected within the watershed.
- Cu and Pb slightly exceeded their respective ecological PALs in one sediment sample (WL2) from Weston Lake. Because of low lake levels during the collection of this sample, the sampling location was moved to an area adjacent to and possibly within the former target area for a small arms range currently being addressed under Fort Jackson's MMRP. The samples collected at other locations in Weston Lake did not contain metals in concentrations that exceeded ecological or human health PALs.
- Cedar Creek and Weston Lake have not been identified as sources of drinking water.

Although the concentrations of Cu and Pb slightly exceeded their respective PALs in one sediment sample, the sample was collected adjacent to (or possibly within the boundary of) an MMRP site. None of the other surface water or sediment samples collected in Weston Lake had detected concentrations of metals MCOC above their respective human health or ecological PALs. The area where the dry season samples for WL2 were collected is being addressed under Fort Jackson's MMRP. Given these results, MCOC metals associated with operational range areas in the Cedar Creek watershed on Fort Jackson and McCrady Training Center are unlikely to pose an unacceptable risk to off-range human or ecological receptors. This conclusion is supported by the repeatability of data demonstrated by the multiple sampling events in different seasons, the inherent conservativeness of the PALs established for this project, and the observed site conditions that naturally mitigate MCOC migration.

8.1.3.2 Explosives MCOC and Perchlorate

The following findings indicate that explosives MCOC and perchlorate are unlikely to migrate downstream of operational range areas within the Colonels Creek watershed at concentrations that pose an unacceptable risk to off-range human and ecological receptors:

- RDX was detected in two of the eight surface water samples collected. Both samples were collected at location WL1. However, concentrations were less than one-sixth of the PAL. No other explosives were detected in surface water.
- No explosives were detected in any of the sediment samples collected within the watershed.
- Perchlorate was detected in two surface water samples collected from Weston Lake (one detection at WL1 and one at WL2). However, concentrations were two orders of magnitude below the applicable PAL.
- Although RDX and perchlorate were present in groundwater within and adjacent to the Cedar Creek watershed (in samples collected from wells as part of the groundwater assessment), some of which likely discharges to Cedar Creek or Weston Lake, measured concentrations in surface water were well below the PAL.

- Cedar Creek and Weston Lake have not been identified as sources of drinking water.

Both RDX and perchlorate were detected in surface water samples at concentrations well below their respective PALs. Also, each was detected in only two of the eight samples collected. Although both RDX and perchlorate were detected in groundwater underlying the Cedar Creek watershed, and in the case of RDX, at concentrations exceeding the human health PAL, surface water results indicate that RDX and perchlorate concentrations in surface water are below their respective PALs. Any RDX and perchlorate in groundwater discharging to Cedar Creek are likely being diluted by the creek to concentrations below PALs. Therefore, within the Cedar Creek surface water system, concentrations of explosives and perchlorate leaving the operational ranges do not pose an unacceptable risk to human or ecological receptors. This conclusion is supported by the repeatability of data demonstrated by the multiple sampling events in different seasons, the inherent conservativeness of the PALs established for this project, and the observed site conditions that naturally mitigate MCOC migration.

8.1.4 Mill Creek Watershed

No surface water system samples were collected from the Mill Creek watershed. As discussed in the project QAPP, this watershed has similar source, pathway, and receptor characteristics as the Cedar Creek watershed, which was used as a worst-case-scenario proxy for the Mill Creek watershed (which has a lower munitions usage rate than Cedar Creek). The results for downstream sample location WL1 in the Cedar Creek watershed were applied as a proxy for a downstream Mill Creek location. None of the MCOC detections at WL1 exceeded the PALs. Therefore, by proxy, neither the surface water nor sediment at the downstream boundary of the operational ranges in the Mill Creek watershed is expected to contain MCOC at concentrations that would pose an unacceptable risk to off-range human or ecological receptors.

8.2 Groundwater System Assessment

The groundwater assessment area was selected to represent a worst-case scenario for explosives and propellant MCOC infiltrating from operational range areas to groundwater and migrating off-range to reach receptors. The intent of selecting a worst-case area to investigate groundwater was to apply the results from the investigation area to the installation as a whole, as appropriate. After a thorough review of site conditions throughout Fort Jackson and McCrady Training Center, conclusions developed as part of this groundwater assessment are considered applicable to source areas on both installations that have been heavily used for training with live rounds containing explosives and perchlorate and where use of small arms is either limited or where their use does not concentrate small arms projectiles in small areas such as berms. These ranges primarily occur within the Colonels Creek, Cedar Creek, and Mill Creek watersheds. Results from the investigation of the groundwater assessment area are unlikely to apply to the potential presence or transport of MCOC metals within the Gills Creek watershed, as aquifer conditions and range use at Gills Creek are very different from conditions within the groundwater assessment area.

8.2.1.1 Metals MCOC

The following findings indicate that metals MCOC are unlikely to migrate via groundwater downgradient of operational range areas at concentrations that pose an unacceptable risk to off-range human receptors:

- Twenty-nine groundwater samples were collected downgradient of potential source areas and analyzed for MCOC metals. The samples were collected from soil borings spaced along a one-mile-long section near the southern combined installation boundary and covered an 80- to 100-foot thick interval of the aquifer, from two shallow piezometers screened across the water table, and from one supply well. Only three samples contained total MCOC metals (total Pb in one sample and total Zn in one sample) above the human health PAL. Of the two, only one sample contained dissolved Zn above the human health PAL.
- In the case of Pb, the sample which exceeded the PAL was collected at the water table. The sample collected immediately below the interval contained total Pb at a concentration well below the PAL (concentration of 3.1 µg/L compared to the PAL of 15 µg/L).
- For Zn, the samples collected both above and below the interval that contained the exceedances again contained Zn at concentrations well below the PAL. The total Zn concentration in the interval above was 438 µg/L while the concentration in the sample below was 577 µg/L. The PAL for Zn in groundwater is 4,700 µg/L .
- As described in Landmeyer et. al (2003), Pb occurs naturally within the sediments that make up the Middendorf Aquifer, present beneath Fort Jackson and the McCrady Training Center. Therefore, the presence of total Pb above the human health PAL in one groundwater sample likely reflects naturally occurring particulate Pb in the formation materials.
- Small arms use within the groundwater assessment area is limited relative to that in other locations on the installations, and ranges with concentrated source areas (such as berms) do not occur within the area.
- U (as U-238) was detected in only one of 36 samples collected from July 2012 to February 2013. No other U isotopes were detected. The concentration of U was two orders of magnitude below the human health PAL.

Pb is naturally occurring within the aquifer, still did not exceed the human health PAL in any of the dissolved samples collected, and was only present above the PAL in one of the 29 samples collected from temporary wells and analyzed for total lead. Similarly, both total and dissolved Zn exceeded the PAL but only in one of the 29 samples collected. Because the Pb and Zn exceedances were so limited in extent, it is unlikely that these results are indicative of groundwater impacted by Pb or Zn from munitions. It is also unlikely that either Pb or Zn in groundwater presents a risk to off-range receptors. U was detected at two orders of magnitude below the human health PAL. Based on the above information, the metals MCOC are unlikely to migrate off-range in groundwater at concentrations that could pose a potential risk to human and ecological receptors. This conclusion is supported by the repeatability of data demonstrated by the multiple sampling events in different seasons, the inherent conservativeness of the PALs

established for this project, and the observed site conditions that naturally mitigate metals MCOC migration. As discussed, this finding may be extrapolated to areas throughout Fort Jackson and McCrady Training Center with similar range use and geologic conditions including the Colonels and Cedar Creek watersheds.

As previously discussed, previous investigations of small arms ranges within Gills Creek have shown that where a clay layers are absent, Pb may impact shallow groundwater. However, within the Gills Creek watershed, shallow groundwater is likely to discharge to directly adjacent surface water bodies before leaving the installation and therefore may contribute Pb concentrations in Gills Creek.

8.2.1.2 Explosives MCOC and Perchlorate

The following findings suggest that explosives MCOC could potentially migrate off-range via groundwater and pose a potential risk to human receptors downgradient of the installation:

- RDX was detected in multiple depth-discrete groundwater samples collected in 2009 in a 60-foot-thick portion of the aquifer at soil boring SB-3. Based upon the presence of RDX in groundwater, additional assessment was determined to be necessary.
- A number of surface water samples collected in 2009 from Weston Lake, which is an identified discharge point for groundwater from the groundwater assessment area, contained both perchlorate and RDX (though at concentrations below their respective surface water PALs).
- Shallow and deep monitoring well pairs installed downgradient of SB-3 and at least 400 feet upgradient of the operational range/installation boundary were sampled three times from July 2012 to February 2013. Two or more explosives were detected during each of the three sampling events with RDX exceeding the PAL at multiple locations during each sampling event.
- RDX was detected consistently at similar concentrations and locations. In particular, RDX concentrations exceeded the groundwater PAL in samples collected from MW-RS-04D and MW-RS-06D during all three rounds of sampling.
- Residential drinking water supply wells were observed downgradient of the monitoring well pairs during windshield surveys of the adjacent off-installation areas, indicating the potential for off-range human receptors. However, only a few well logs were available for review from the SCDNR. The available well logs show that groundwater within the intervals in which explosives were detected is utilized as a drinking water source as close as 600 feet downgradient of the monitoring well in which RDX exceeded the PAL.
- Both Fort Jackson and McCrady Training Center represent important recharge areas for the Middendorf Aquifer. Precipitation exceeds evapotranspiration in the area, increasing the potential for MCOC at the surface to infiltrate to groundwater.
- Estimated groundwater flow velocities indicate that water originating in operational range areas within the last seven to eight years could now be reaching the combined installation boundary. Where coarser zones are present, flow velocities could be greater.

RDX was detected at concentrations that exceeded the human health PAL at the groundwater assessment area. RDX was detected in samples collected downgradient of the groundwater assessment area and upgradient of residential drinking water wells located to the south of the operational range and installation boundary. Given the repeated detections of RDX in groundwater wells located within 350 feet to 1,300 feet of the installation boundary, there is a potential for explosives MCOC in groundwater to migrate downgradient of operational range areas and reach residential wells. However, uncertainty remains regarding the actual risk to potential off-range receptors as no groundwater samples were collected off-installation as part of this assessment.

The following findings indicate that perchlorate is unlikely to migrate downstream of operational range areas at concentrations that pose an unacceptable risk to off-range human receptors:

- Perchlorate was detected in seven of 29 groundwater samples analyzed (six of the detections were from temporary wells and one of the detections was from the Weston Lake supply well WL1). However, concentrations were nearly one order of magnitude below the LRU and two orders of magnitude below the human health PAL.
- The HHRE concluded that the potential for unacceptable health risks to downgradient potable water users is below the upper end of the risk range established by the National Contingency Plan (*i.e.*, 1×10^{-4}), based on the groundwater assessment area data.

8.3 Conclusions

MCOC source-receptor pathways are potentially complete at Fort Jackson and McCrady Training Center for ecological receptors of surface water within the Gills Creek watershed downstream of the range boundary and for human groundwater receptors downgradient of the groundwater assessment area (**Figure 8-1**).

For the conditions evaluated during the 2009 surface water system investigation, there is the potential for MCOC metals concentrations to pose an unacceptable risk to ecological receptors along portions of Gills Creek watershed downstream of the small arms ranges and within the operational range boundary located within the watershed. Boyden Arbor Pond may act as a "sink" for these metals, the evaluation of the risk to receptors within or downgradient of the pond was not completed as part of this assessment.

Given the presence of RDX in groundwater downgradient of the groundwater assessment area during the 2009 and 2012/13 sampling events, there is a potential for RDX to migrate off-range via groundwater. RDX was detected in wells near the operational range and installation boundaries at concentrations that exceed the human health PAL. Given the close proximity of these wells to the installation boundary and the presence of residential wells located within approximately 400 feet downgradient, there is a potential for RDX to migrate off-range and reach human receptors through drinking water. Although the screening-level HHRE concluded that risks to human receptors were minimal due to RDX in groundwater based on the Phase II data, samples were not collected at potential receptor wells located off-installation. Because the assessment of the groundwater system focused on a "worst-case" area these findings apply to

other areas with similar usage and similar subsurface and hydrogeologic conditions to those encountered within and downgradient of the groundwater assessment area.

Additional action may be required to further evaluate or mitigate the potential for metals MCOC to migrate to off-range receptors downgradient of the operational areas within the Gills Creek watershed. Further assessment may similarly be required to evaluate the potential risk, if any, posed by RDX in groundwater to groundwater users located downgradient of the groundwater assessment area.

Based on the present evaluation and current usage patterns, it is unlikely that surface water pathways pose an unacceptable risk to off-range human or ecological receptors associated with operational range areas in the Colonels Creek, Cedar Creek, or Mill Creek watersheds. These operational areas may be placed into a review cycle to periodically evaluate whether future changes in conditions pose unacceptable risk to off-range human or ecological receptors (**Figure 8-1**).

The implementation of best management practices can serve to limit or slow the migration of MCOC.

McCrady Training area

Kevin S, Maddison H, Robin M — meet w/ Mr. Cooke

Kass Pass - Pistol range
Light Rifle
KD range
Maintank range
Common Impact area w/ Fort Jackson
have ranges w/in Jackson
White area is discanced area
1 demo area - training range
MOUT - NOT live-fire since 70s (latest)
CBT - was machine gun range - not used since 80s latest
- Southeast corner of McCrady had old range complex in 50s 60s
Sactive - live fire until 60s, shooting from perimeter in from SE to NW in particular also S to N, N to S
WILDcat road - public road thru installation - was open post - closed at 9/11 & became closed post
Most heavily used
13|4, Pistol, ARGENTAN, demo, tank range
16 pt qual range
On Jackson property
(Combat 2 - Training area, movement to live fire contact, simulation (on McCrady)

on McCrady

- Kass Pass - Not used a ton
- CPac

side by side
Argentine - used for small arms
Light Demo range - sporadically used for classes
- Fort J - Basic training year round

Combat Pistol Range/ Kasserine Pass range

Combat Pistol
15 firing lanes w/ standing positions
5 rows of mounded pop-up tages
- mod vegetated
back berm with tree line behind
enclosed on 3 sides
- gravel firing line
tree line shows thinning from firing
tree line surrounds range on three sides
- used 20-30 X per year

KASS PASS
6 firing lanes toward metal targets, tank targets & covered firing positions
gravel firing line
M203 primarily
tree line surrounding 3 sides
Old spot for Marksmanship range
- inactive
shooting toward downgradient

used ~4X a year
old sand berm shows evidence from old mover

Argentan

17 firing lanes, w/ stand positions
Covered fire line w/ shredded tire
surrounded by tree line on 3 sides
access road on SE side of range
~200 meters
sparse veg over sandy areas down-range
bullet pockets & bullets in back berm
Sandy back berm, sparsely veg
vegetated area behind back berm
drainage would flow east where rift raft is present - no H_2O present but NE-E of berm
- regularly used

TANK RANGE (MAIN TANK)

sits on high topo point, sandy base line
machine gun, tanks
New Machinegun range to be built in a few years
1500 meters
movers, targets w/ berms (unveg)
small arms evidence
drainage toward SE

usually used for machine guns

light DEMO RANGE

partially vegetated w/ shortgrass
dirt path through range, through back tree line - tree line surrounds on 3 sides
~~Firing~~ Range on slope down to tree line
demo area graded
cement bunker w/ glass windows on south (top & upgradient) side of range
low-ceiling shots

prescribed burns yearly

Fort Jackson March 8, 2023
Sampling Event
Kevin Sharpe, Derek Hendricks, Lee Peterson, Maddison H, Terry
Met w/ range control at 0800
Arrive at CC2 (reference) @ 0915
2 Groups
- Maddison, Lee, Derek
- Robin, Kevin, Terry

Collect CC2 @ 1000
Leave site @ 1020

Arrive @ MC1 @ 1135
Collect MC1 @ 1150
Leave @ 1220

Arrive @ MC3 @ 1315
Collect @ MC3 @ 1400
Leave @ 1450 Take Dup 4oz 8oz

Collect EB @ 1530
JACKSON-EB-01
Arrive back to hotel @ 1600 to process sample

Explosives, Metals, TOC

7 x 8oz jars
1 x 8 oz jars

SEM/AVS
7 x 4 oz jars
1 FD 4 oz
1 MS 4 oz
1 MSD 4 oz

MS/MSD

* MC2 - 1130
CC3 - 1415
CC4 - 0940

I have read the Accident Prevention Plan and have been briefed on anticipated site hazards, required accident prevention, and emergency response for work to be performed at this site. I agree to conform to all the requirements of this Plan.

ORA Sampling Rm. 224 Scale

1240-1330 To BWI

1525-1700 Flight to Charleston, SC w/ Robin & Cor

1700-1930 Pick up rental trucks and drive w/ Geo to Towne Place Suites in Columbia, SC

1930-2045 Dock had sorted equipment, so we loaded equipment into trucks and had a brief meeting inside the hotel. In room afterwards.

03/08/23 Wednesday

0640 - To Walmart w/ Dock for supplies

0730 - To Ft Jackson Columbia Gate

0815 - At Range Control cut by Ranger J.

0900 - To CC2 & CC4. Robin Tom and I

Sampled CC2 - swampy area upstream of culvert

Dock, Lee, and Maddison on other team

1100 To Mill Creek #1. We walked from a fire break to the location - a 3-4 ft wide channel filled w/ some algae and precip. Sandy channel. Dock

Dock and others did MC #2 quick grab & done.

1300 At MC #3 - A long walk down to river

Looks big RL 15 ft channel. Sandy. Flowing well

Dock and others to JC #1 and CC #3 and 5 beside

Location Fort Jackson, SC Date 03/08/23

ORA Sampling

1500 - Back at MC#7 Packing Area and sorting and processing samples

1600-1730 At hotel sorting and processing samples in parking lot

1740 - Done for the day

03/09/23 Thursday

0730 Jim Cook 803-667-2572 Bldg 3760. MTC

Kathryn Butler 803-751-7322 Office

IRP Manager FS 803-571-1356 cell

2067 EFMSS 13, 14 Cabot Pistol M&T area

2563 Bldg Done for EFMSS Data

1230 Finish at McCrady's Jim Cook - Town of Five Ranges

0845

1230-1430 Back to Hotel Area for lunch then to packing samples - Robins & Maddison

1430-1500 To Ft Jackson environmental office on Essayons Bl. Bldg 2563. Met Mr. McKnight & met with Kathryn Butler and Barbara Williams. BW issues were counting a few inv. at Remington Range and limited timeframe to review the work-plan

1500-1730 - Packing samples, COC at hotel then to Walmart for 7.5-gal bags, ice, and a box

1730-1845 Finish packing then to Fedex and shipped coolers & Katahdin and equipment back to EA. Then home.

Location Fort Jackson, SC Date 03/10/23

Project / Client USAEC

ORA Sampling Scale

03/10/23 Friday

0730 - Depart hotel to CHS airport.

0950 - At airport, then to gate for 1120 flight to BWI.

1120-1330 to BWI then to office - EOD

9/1/2023

Brief McCrady

gate @ 8:30

in-brief @ 8:40

- pistol Range
- ★ Light demo ★ on post
- KD
- main tank range ← Dimer monitoring
- 13 & 14 ← shared impact area w/ Jackson

McCrady manages these ranges w/ shared impact area

- 15,000 TA (cleared) ← cleared area

- ★ MOUT site not like fire not like one since 70's
- ★ Machine gun range ← Convoy 2 No live fire since 80's

grenade area 50's - 60's

↳ None of range complex in between right here of McCrady ranges

SOR

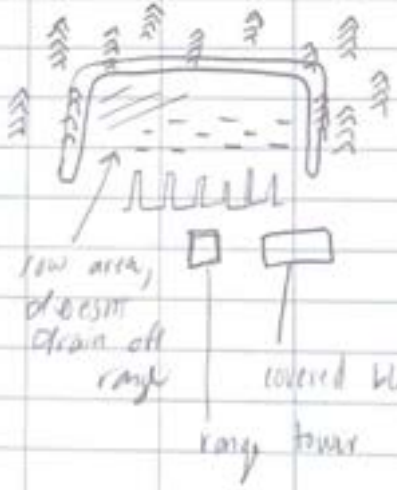
- 13, 14 & pistol most heavily used
  9 in Jackson
- 14? 16 point qual. range
- going to look @ ranges closer to McCrady proper
  - > will obtain full RFMSS data from 2007
  - Light Demo ← used in sports
  - Main tank Range
  - CP 60 → only CPQC on Jackson
    - → Vehicle Qual range used to McCrady
    - → only JT → lots of use / units
  - (556 762 Argentine?)

3/9/2023

Left @ 9:30 to 1045

CPQC 0950

- 15 firing points / 20/30 times/year
- automated targets
- bare berms (range proper)
- well veg range floors
- slopes towards W/N west
- back berm well vegetated
- some bullet pockets in back berm
- munitions present in target field
- drainage/erosion behind berms
- side berms
- forested on all sides

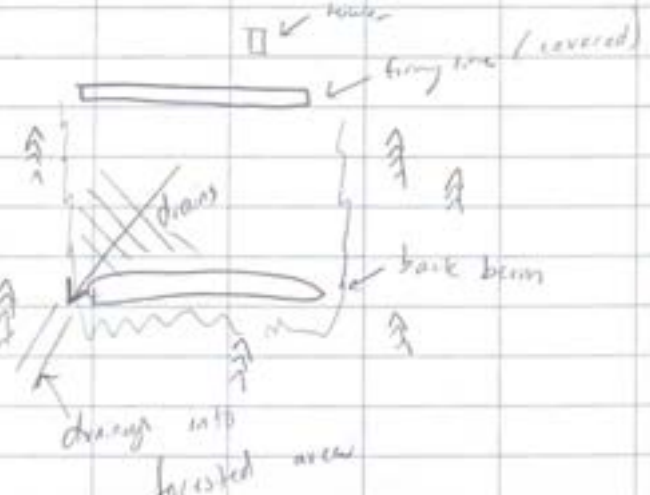


Kaserne pass 1000

- drainage channel behind firing line
- firing point on gravel berm
- M703, 556, 762
  - mostly used
  - used to be fired
- well veg range floor
- bare sandy back berm
- slopes uphill, low area halfway through
- 4x / year

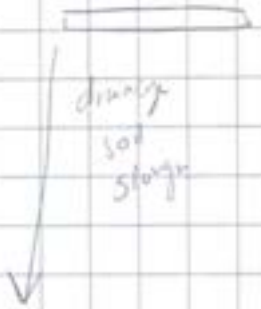
ARGENTAN 1020

- covered firing line
- unveg back berm w/ erosional line
- well veg range floor
- KD range
- trees on ground
- well vegetated drainage (trees in drainage)
- rip-rap in drain
- back berm eroding
- different target groups
- drainage from behind firing line



Main Tank Range 1050

- Training & maneuver area
- tanks fire from berm
- machine gun fire into machine gun range gets back berm mid-distance other targets etc
- 1,500 meters out shooting
- unvegetated tank trails
- vegetation most everywhere else
- primarily machine gunners
-



Light Demo 1125

- Well vegetated except where actual demo occurs
- No frag pcs
- Clean up frag
- grade at after use

SQ1188

Sample Receipt

The following samples were received on March 10, 2023 and were logged in under Katahdin Analytical Services work order number SQ1188 for a hardcopy due date of March 24, 2023.

KATAHDIN Sample No.	EA ENGINEERING Sample Identification
SQ1188-1	JACKSON-SDCC3-DC-01
SQ1188-2	JACKSON-SDCC3-DC-01
SQ1188-3	JACKSON-SDCC2-DC-01
SQ1188-4	JACKSON-SDCC2-DC-01
SQ1188-5	JACKSON-SDMC3-DC-01
SQ1188-6	JACKSON-SDMC3-DC-01
SQ1188-7	JACKSON-SDMC1-DC-01
SQ1188-8	JACKSON-SDMC1-DC-01
SQ1188-9	JACKSON-SDCC4-DC-01
SQ1188-10	JACKSON-SDCC4-DC-01
SQ1188-11	JACKSON-SDJC1-DC-01
SQ1188-12	JACKSON-SDJC1-DC-01
SQ1188-13	JACKSON-SDMC2-DC-01
SQ1188-14	JACKSON-SDMC2-DC-01
SQ1188-15	SDDUP
SQ1188-16	SDDUP

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAP standards unless otherwise noted in this narrative or in the Report of Analysis.

We certify that the test results provided in this report are accredited under the laboratory's ISO/IEC 17025:2017 and DoD-ELAP accreditation issued by the ANSI-ASQ National Accreditation Board. Refer to certificate and scope of accreditation L2223.

Analytes which are reported but not listed on our ANAB scope of accreditation will be "^" flagged and the following language will be included in the case narrative for all DoD compliant work: "^" Indicates this analyte is not included on Katahdin Analytical Services DoD-ELAP Scope of Accreditation.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Heather Manz**. This narrative is an integral part of the Report of Analysis.

Organics Analysis

The samples of SQ1188 were analyzed in accordance with Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, EPA publication SW-846, Third Edition, Final Updates I (1993), II (1995), IIA (1994), IIB (1995), III (1997), IIIA (1999), IIIB (2005), IV (2008), V (2015) and VI (2019), and/or for the specific methods listed below or on the Report of Analysis.

Sample SQ1188-5 was used for the Matrix Spike (MS) and Matrix Spike Duplicate (MSD), as requested by the client.

8330B Analysis

Sample SQ1188-7 had a low recovery for the extraction surrogate 1,2-dinitrobenzene which was outside the DoD QSM acceptance limits.

All samples were initially analyzed on the primary Phenomenex column. If a sample has a peak that is within the retention time window of a target analyte and the concentration is above the PQL, the sample is reanalyzed for confirmation on the confirmation Acclaim E2 column. An analyte is considered confirmed if the mentioned criteria are achieved with both columns. The results from the primary column are reported.

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are based on the DoD QSM acceptance limits for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is to take corrective action only if the number of spiked analytes in the LCS that are outside of the QC limits is greater than the DoD QSM allowable number of exceedances, which is one. If the associated MS/MSD has greater than the allowable number of exceedances, no corrective action is taken, as long as the LCS is acceptable.

The calibration verification standards (files HQC00151 and HQC00164) had high responses for the target analyte tetryl that resulted in %Ds that were outside of the DoD QSM acceptance limits of 20%.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of Katahdin Work Order SQ1188 were prepared and analyzed for metals in accordance with Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, EPA publication SW-846, Third Edition, Final Updates I (1993), II (1995), IIA (1994), IIB (1995), III

(1997), IIIA (1999), IIIB (2005), IV (2008), V (2015), and VI (2019). Office of Solid Waste and Emergency Response, U.S. EPA.

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP)

Solid-matrix Katahdin Sample Numbers SQ1188-(2, 4, 6, 8, 10, 12, 14, and 16) were prepared for ICP analysis on 03/21/2023 (QC Batch QC21ICS2) in accordance USEPA Draft Method 821/R-91-100 (Acid Volatile Sulfide / Simultaneously Extractable Metals). Katahdin Sample Number SQ1188-8 was prepared in duplicate and with a matrix-spiked aliquot. The detected concentration of zinc in the preparation blank, PBSQC21ICS2 was above project acceptance criteria. However, there are not undisturbed aliquots of the associated samples available for re-preparation, therefore, results were reported without corrective action.

ICP analyses of Katahdin Work Order SQ1188 sample digestates were performed using a Thermo iCAP 6500 ICP spectrometer in accordance with USEPA Method 6010C. All samples were analyzed within holding times and all analytical run QC criteria were met.

Inductively-Coupled Plasma Mass Spectrometric Analysis (ICP-MS)

Solid-matrix Katahdin Sample Numbers SQ1188-(1, 3, 5, 7, 9, and 15) were digested for ICP-MS analysis on 03/14/2023 (QC Batch QC14IMS2) in accordance with USEPA Method 3050B. Per client request, Katahdin Sample Number SQ1188-5 was prepared with duplicate matrix-spiked aliquots. Duplicate laboratory control samples were prepared in this batch. The measured lead concentration in the preparation blank, PBSQC14IMS2, is above the project acceptance limit. The measured lead concentrations of all samples were greater than ten times that of the preparation blank and were reported with a “B” flag.

Solid-matrix Katahdin Sample Numbers SQ1188-(11 and 13) were digested for ICP-MS analysis on 03/16/2023 (QC Batch QC16IMS1) in accordance with USEPA Method 3050B. The detected concentration of zinc in the preparation blank, PBSQC16IMS1 was above project acceptance criteria. The samples were re-digested on 3/31/2023 (QC Batch QC31IMS1) with similar blank contamination. Results from the original batch are reported.

ICP-MS analyses of Katahdin Work Order SQ1188 sample digestates were performed using an Agilent 7800 ICP-MS spectrometer in accordance with USEPA Method 6020A. Results for all standards and samples are reported using the mean of 3 replicate measurements. All sample digestates were diluted by a factor of 5 during analysis to reduce mass interferences from chlorine, which is present in the digestates from the hydrochloric acid used in digesting the samples. All samples were analyzed within holding times and all analytical run QC criteria were met.

Internal standard recoveries for ICP-MS analyses can be found in the raw data section of the accompanying data package. The following table indicates which analytes are associated with each internal standard element.

Internal Standard Element	Associated Analytes
Lithium	Beryllium, Boron
Scandium	Sodium, Magnesium, Aluminum, Potassium, Calcium
Germanium or Yttrium	Vanadium, Chromium, Manganese, Iron, Cobalt, Nickel, Copper, Zinc, Arsenic, Selenium, Silver, Cadmium, Strontium, Molybdenum
Terbium	Antimony, Barium, Tin, Tungsten
Bismuth	Lead, Thallium, Thorium, Uranium

Instrument tuning information can also be found in the raw data section in the reports labeled "USEPA Method Tune Report". For Method 6020A, the relative standard deviation was determined from 5 replicate measurements and the peak width was measured at 10% of the peak height.

Matrix QC Summary

The measured recoveries in the matrix-spiked aliquots of Katahdin Sample Number SQ1188-5 are outside laboratory acceptance criteria for antimony and lead.

The measured recoveries in the matrix-spiked aliquot of Katahdin Sample Number SQ1188-8 are outside laboratory acceptance criteria for lead and silver.

The duplicate precision of antimony, copper, and zinc in the matrix-spiked duplicate aliquots of Katahdin Sample Number SQ1188-5 were outside of project acceptance criteria.

Reporting of Metals Results

Per client request, analytical results for client samples on Form I and preparation blanks on Form IIIP have been reported using the laboratory's limits of detection (LOD). All results were evaluated down to the laboratory's method detection limits (MDLs). Results that fall between the MDL and the LOQ are flagged with "J" in the C-qualifier column, and the measured concentration appears in the concentration column. Results that are less than the MDL are flagged with "U" in the C-qualifier column, and the LOD is listed in the concentration column. These LOQs, MDLs and LODs have been adjusted for each sample based on the sample amounts used in preparation and analysis.

Analytical results on Forms VA, VD, VII, and IX for client samples, matrix QC samples (duplicates and matrix spikes), and laboratory control samples have been reported down to the laboratory's method detection limits (MDLs). Analytical results that are below the MDLs are flagged with "U" in the C-qualifier column, and the adjusted LOD is listed in the concentration column.

Analytical results for instrument run QC samples (ICVs, ICBs, etc.) have been reported down to the laboratory's instrument detection limits (IDLs).

IDLs, LODs, MDLs, and LOQs are listed on Form 10 of the accompanying data package.

Analytical results for client samples, matrix QC samples (duplicates and matrix spikes), and batch QC samples (preparation blanks and laboratory control samples) for simultaneously extractable metals analysis (SEM) have been reported in units of micromole per gram (umole/g) throughout the accompanying data package.

Wet Chemistry Analysis

The samples of Katahdin sample number SQ1188 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for acid volatile sulfide (AVS) were performed according to "Draft Analytical Method for Determination of Acid Volatile Sulfide in Sediment", EPA 821/R-91-100, December 1991.

Analyses for total solids were performed according to "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", EPA publication SW-846, Third Edition, Final Updates I (1993), II (1995), IIA (1994), IIB (1995), III (1997), IIIA (1999), IIIB (2005), IV (2008), V (2015) and VI (2019).

All Wet Chemistry results were evaluated to Katahdin Analytical Services' Method Detection Limits (MDL). Measured concentrations that fall between the MDL and Katahdin's Limit of Quantitation (LOQ) are flagged "J". Measured concentrations that are below the MDL are flagged "U" and reported as "U LOD", where "LOD" is the numerical value of the Limit of Detection.

All analyses were performed within analytical holding times. All quality control criteria were met with the following exception:

The matrix spike performed on SQ1188-8 has a recovery of 42% which outside of the laboratory range (75-125%). No corrective action was taken since all other quality control samples are within the limits.

The client requested a matrix spike (MS) and matrix spike duplicate (MSD) on sample SQ1188-5. Due to analyst error the MS and MSD were not prepared or analyzed. The client was contacted.

Subcontracted Data

Analyses for Total Organic Carbon (TOC) by Method EPA Lloyd Kahn were performed by a subcontract laboratory. Please refer to the section of the data package titled Subcontracted Data.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Quality Assurance Officer, or their designee, as verified by the following signature.

April, 10th, 2023

Quality Assurance Officer

Katahdin Analytical Services, Inc.

Manual Integration Codes For GC/MS, GC, HPLC and/or IC

M1	Peak splitting.
M2	Well defined peaks on the shoulders of the other peaks.
M3	There is additional area due to a coeluting interferant.
M4	There are negative spikes in the baseline.
M5	There are rising or falling baselines.
M6	The software has failed to detect a peak or misidentified a peak.
M7	Excessive peak tailing.
M8	Analysis such as GRO, DRO and TPH require a baseline hold.
M9	Peak was not completely integrated as in GC/MS.
M10	Primary ion was correctly integrated, but secondary or tertiary ion needed manual integration as in GC/MS.
M11	For GC analysis, when a sample is diluted by 1:10 or more, the surrogate is set to undetected and then the area under the surrogate is manually integrated.
M12	Manual integration saved in method due to TurboChrom floating point error.

Katahdin Analytical Services, LLC. — Sample Receipt Condition Report

Client:	EA Engineering	KAS PM:	HHM	Sampled By:	Client

KAS Work Order#:	SQ 1188	KIMS Review By:	HHM	Received By:	GT
		Labeled By:	GT		
SDG #:		Cooler: 1 of 1		Date/Time Rec.:	3/10/23 0940

Receipt Criteria	Y	N	EX*	NA	Comments and/or Resolution
1. Custody seals present / intact?	✓				
2. Chain of Custody present in cooler?	✓				
3. Chain of Custody signed by client?	✓				
4. Chain of Custody matches samples?	✓				
5. Temperature Blanks present? If not, take temperature of any sample w/ IR gun.	✓				Temp (°C): 4.8° — Thermometer ID: IR-1
Samples received at <6 °C w/o freezing?	✓				Note: Not required for metals (except Hg soil) analysis.
Ice packs or ice present?	✓				The lack of ice or ice packs (i.e. no attempt to begin cooling process) or insufficient ice may not meet certain regulatory requirements and may invalidate certain data.
If yes, was there sufficient ice to meet temperature requirements?	✓				
If temp. out, has the cooling process begun (i.e. ice or packs present) and sample collection times <6hrs., but samples are not yet cool?				✓	Note: No cooling process required for metals (except Hg soil) analysis.
6. Volatiles:					
Aqueous: No bubble larger than a pea?				✓	
Soil/Sediment:					
Received in airtight container?				✓	
Received in methanol?				✓	
Methanol covering soil?				✓	
D.I. Water - Received within 48 hour HT?				✓	
7. Trip Blank present in cooler?				✓	
8. Proper sample containers and volume?	✓				
9. Samples within hold time upon receipt?	✓				
10. Aqueous samples properly preserved?					
Metals, COD, NH3, TKN, O/G, phenol, TPO4, N+N, TOC, DRO, TPH – pH <2				✓	
Sulfide - >9				✓	
Cyanide – pH >12				✓	
11. Bottleware Prepped on:					

* Log-In Notes to Exceptions: document any problems with samples or discrepancies or pH adjustments.

SAMPLE DATA SUMMARY PACKAGE

KATAHDIN ANALYTICAL SERVICES - ORGANIC DATA QUALIFIERS

U Indicates the compound was analyzed for but not detected above the specified level. This level may be the Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client.

Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL, "U" LOQ or "U" LOD, where the rate of false negatives is <1%.

* Compound recovery or percent RPD (relative percent difference) was outside of quality control limits.

D Indicates the result was obtained from analysis of a diluted sample. Surrogate recoveries may not be calculable.

E Estimated value. This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis.

J Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), but above the Method Detection Limit (MDL).

And/or

J Used for Dual Column analytes when there is a greater than 40% difference for detected concentrations between the two GC/HPLC columns.

B Indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample.

I Indicates that the flagged compound did not meet DoD criteria in the corresponding Initial Calibration (ICAL).

D Indicates that the flagged compound did not meet DoD criteria in the corresponding Initial Calibration Verification (ICV).

C Indicates that the flagged compound did not meet DoD criteria in the corresponding opening Calibration Verification (CV).

V Indicates that the flagged compound did not meet DoD criteria in the corresponding closing Calibration Verification (CV).

L/LL Indicates that the flagged compound did not meet DoD criteria in the corresponding Laboratory Control Sample (LCS) and/or Laboratory Control Sample Duplicate (LCSD) prepared and/or analyzed concurrently with the sample.

M/MM Indicates that the flagged compound did not meet DoD criteria in the Matrix Spike (MS) and/or Matrix Spike Duplicate MSD) prepared and/or analyzed concurrently with the native sample.

H Indicates the flagged compound was detected on the primary column but was not detected on the confirmation column therefore the compound is not reported as a positive detection. (SW846 8330A/B only)

METALS SAMPLE FLAGGING

FLAG	SPECIFIED MEANING
E	The reported value is estimated because of the presence of interference (as indicated by serial dilution).
N	The pre-digestion spiked sample recovery is not within control limits.
*	The duplicate sample analysis relative percent difference (RPD) is not within control limits.
B	Indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample.
A	The post-digestion spiked sample recovery is not within control limits.
•	Analytical run QC sample (e.g. ICV, CCV, ICB, CCB, ICSA, ICSAB) not within control limits.
U	The analyte was not detected above the specified level. This level may be the Limit of Quantitation (LOQ) (previously called Practical Quantitation Level (PQL)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client. Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL/LOQ or "U" LOD, where the rate of false negatives is <1%.
J	The analyte was detected in the sample at a concentration less than the laboratory Limit of Quantitation (LOQ) (previously called Practical Quantitation Limit (PQL)), but above the Method Detection Limit (MDL).
Q	One or more quality control criteria failed (e.g., LCS recovery, surrogate spike recovery or CCV).

KATAHDIN ANALYTICAL SERVICES – INORGANIC DATA QUALIFIERS

The sampled date indicated on the attached Report(s) of Analysis (ROA) is the date for which a grab sample was collected or the date for which a composite sample was completed. Beginning and start times for composite samples can be found on the Chain-of-Custody.

U Indicates the compound was analyzed for but not detected above the specified level. This level may be the Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client.

Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL "U" LOQ or "U" LOD, where the rate of false negatives is <1%.

E Estimated value. This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis.

J Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), but above the Method Detection Limit (MDL).

I-7 The laboratory's Practical Quantitation Level (PQL) or LOQ could not be achieved for this parameter due to sample composition, matrix effects, sample volume, or quantity used for analysis.

A-4 Please refer to cover letter or narrative for further information.

H_ Please note that the regulatory holding time for _____ is "analyze immediately". Ideally, this analysis must be performed in the field at the time of sample collection. _____ for this sample was not performed at the time of sample collection. The analysis was performed as soon as possible after receipt by the laboratory.

H1 - pH H2 - DO H3 - sulfite H4 - residual chlorine

T1 The client did not provide the full volume of at least one liter for analysis of TSS. Therefore, the PQL of 2.5 mg/L could not be achieved.

T2 The client provided the required volume of at least one liter for analysis of TSS, but the laboratory could not filter the full one liter volume due to the sample matrix. Therefore, the PQL of 2.5 mg/L could not be achieved.

M1 The matrix spike and/or matrix spike duplicate recovery performed on this sample was outside of the laboratory acceptance criteria. Sample matrix is suspected. The laboratory criteria was met for the Laboratory Control Sample (LCS) analyzed concurrently with this sample.

M2 The matrix spike and/or matrix spike duplicate recovery was outside of the laboratory acceptance criteria. The native sample concentration is greater than four times the spike added concentration so the spike added could not be distinguished from the native sample concentration.

R1 The relative percent difference (RPD) between the duplicate analyses performed on this sample was outside of the laboratory acceptance criteria (when both values are greater than ten times the PQL).

MCL	Maximum Contaminant Level	NL	No limit
NFL	No Free Liquid Present	FLP	Free Liquid Present
NOD	No Odor Detected	TON	Threshold Odor Number

D-1 As required by Method 5210B, APHA Standard Methods for the Examination of Water and Wastewater (21st edition), the BOD value reported for this sample is 'qualified' because the check standard run concurrently with the sample analysis did not meet the criteria specified in the method (198 +/- 30.5 mg/L). These results may not be reportable for compliance purposes.

D-2 The measured final dissolved oxygen concentrations of all dilutions were less than the method-specified limit of 1 mg/L. The reported BOD result was calculated assuming a final oxygen concentration equal to 1 mg/L. The reported value should be considered a minimum value.

D-3 The dilution water used to prepare this sample did not meet the method and/or regulatory criteria of less than 0.2 or 0.4 mg/L dissolved oxygen (DO) uptake over the five day period of incubation. These results may not be reportable for compliance purposes.

Sample Data Section

KATAHDIN ANALYTICAL SERVICES - ORGANIC DATA QUALIFIERS

U Indicates the compound was analyzed for but not detected above the specified level. This level may be the Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client.

Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL, "U" LOQ or "U" LOD, where the rate of false negatives is <1%.

* Compound recovery or percent RPD (relative percent difference) was outside of quality control limits.

D Indicates the result was obtained from analysis of a diluted sample. Surrogate recoveries may not be calculable.

E Estimated value. This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis.

J Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), but above the Method Detection Limit (MDL).

And/or

J Used for Dual Column analytes when there is a greater than 40% difference for detected concentrations between the two GC/HPLC columns.

B Indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample.

I Indicates that the flagged compound did not meet DoD criteria in the corresponding Initial Calibration (ICAL).

D Indicates that the flagged compound did not meet DoD criteria in the corresponding Initial Calibration Verification (ICV).

C Indicates that the flagged compound did not meet DoD criteria in the corresponding opening Calibration Verification (CV).

V Indicates that the flagged compound did not meet DoD criteria in the corresponding closing Calibration Verification (CV).

L/LL Indicates that the flagged compound did not meet DoD criteria in the corresponding Laboratory Control Sample (LCS) and/or Laboratory Control Sample Duplicate (LCSD) prepared and/or analyzed concurrently with the sample.

M/MM Indicates that the flagged compound did not meet DoD criteria in the Matrix Spike (MS) and/or Matrix Spike Duplicate MSD) prepared and/or analyzed concurrently with the native sample.

H Indicates the flagged compound was detected on the primary column but was not detected on the confirmation column therefore the compound is not reported as a positive detection. (SW846 8330A/B only)

Katahdin Analytical Services, Inc.

Manual Integration Codes For GC/MS, GC, HPLC and/or IC

M1	Peak splitting.
M2	Well defined peaks on the shoulders of the other peaks.
M3	There is additional area due to a coeluting interferant.
M4	There are negative spikes in the baseline.
M5	There are rising or falling baselines.
M6	The software has failed to detect a peak or misidentified a peak.
M7	Excessive peak tailing.
M8	Analysis such as GRO, DRO and TPH require a baseline hold.
M9	Peak was not completely integrated as in GC/MS.
M10	Primary ion was correctly integrated, but secondary or tertiary ion needed manual integration as in GC/MS.
M11	For GC analysis, when a sample is diluted by 1:10 or more, the surrogate is set to undetected and then the area under the surrogate is manually integrated.
M12	Manual integration saved in method due to TurboChrom floating point error.

Chloropicrin
Contains the following in **Methanol**

Concentration	Compound
1000 µg/mL	Chloropicrin

S-911
MP220919008

*** END LIST ***

Danger

Storage: **Freezer**

Highly flammable liquid and vapour. Toxic if inhaled. Causes damage to the central nervous system and the visual organs.
If medical advice is needed, have product container or label at hand. Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking. Use explosion-proof electrical/ ventilating/ lighting/ equipment. Do not breathe dust/ fume/ gas/ mist/ vapours/ spray. IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water/shower. Dispose of contents/container in accordance with local/regional/national/international regulations.

METALS DATA

Sample Data Section

METALS SAMPLE FLAGGING

FLAG	SPECIFIED MEANING
E	The reported value is estimated because of the presence of interference (as indicated by serial dilution).
N	The pre-digestion spiked sample recovery is not within control limits.
*	The duplicate sample analysis relative percent difference (RPD) is not within control limits.
B	Indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample.
A	The post-digestion spiked sample recovery is not within control limits.
•	Analytical run QC sample (e.g. ICV, CCV, ICB, CCB, ICSA, ICSAB) not within control limits.
U	The analyte was not detected above the specified level. This level may be the Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client. Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL, "U" LOQ or "U" LOD, where the rate of false negatives is <1%.
J	Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), but above the Method Detection Limit (MDL).
Q	One or more quality control criteria failed (e.g., LCS recovery, surrogate spike recovery or CCV).

FILE NAME: IQC24A

Reviewed By: KS 3/29/23

The pHs of all samples that were tested by direct analysis in this analytical run were checked just prior to analysis and confirmed to be <2. The time of preservation of these samples was checked in the "Measured Turbidity and Preservation of Incoming Samples" logbook to verify that they had been preserved at least 16 hours prior to analysis. These verifications were performed by_____ (initials) on _____ (date).

STANDARDS USED:

Additional Comments and Notes:

*- New CCV (MW21440) made on 03/24/2023 and used starting at 16:39. This ccv was used as 1st ccv (±5%) for 200.7 analysis.

3x diln.: 3.0 mL of sample (pipet M30) + 6.0 mL of MW21420 (pipet M31)

2x diln.: 4.0 mL of sample (pipet M30) + 4.0 mL of MW21420 (pipet M31)

10x diln.: 0.8 mL of sample (pipet M19) + 7.2 mL of MW21420 (pipet M31)

5x diln.: 1.6 mL of sample (pipet M30) + 6.4 mL of MW21420 (pipet M31)

25x diln.: 0.4mL of (pipet M19) + 9.6 mL of MW21420 (pipet M31)

Post Spike: 4ul MS2399 (pipet M17), 80ul MS2411 (pipet M27), 40ul MS2444 (pipet M27), 40ul MS2401 (pipet M27) to 8.0mL of sample (pipet M31)

KATAHDIN ANALYTICAL SERVICES, LLC
METALS ANALYSIS RUN INFORMATION SHEET

INSTR. ID: L (Agilent 7800) **ANALYST**: KS **ANALYSIS DATE**: 03/21/23

METHOD: ICP-MS
- ☐ 200.8
- ☑ 6020
- ☑ DOD

FILE NAME: LQC21A

Reviewed By: EA 03/21/23

The pHs of all samples that were tested by direct analysis in this analytical run were checked just prior to analysis and confirmed to be <2. The time of preservation of these samples was checked in the "Measured Turbidity and Preservation of Incoming Samples" logbook to verify that they had been preserved at least 16 hours prior to analysis. These verifications were performed by ____ (initials) on ____ (date).

STANDARDS USED:

Standard Name	Standard ID	Prep Date	Expiration Date	Standard Conc.
Cal Blk/ICB/CCB	MW21411	03/02/23	03/02/24	0 ug/L
Cal Std	MW21414	03/02/23	03/25/23	Varies by Element
ICV	MW21429	03/15/23	06/14/23	Varies by Element
PQL	MW21412	03/02/23	03/25/23	Varies by Element
LRS1	MW21330	01/17/23	03/25/23	Varies by Element
LRS2	MW21331	01/17/23	04/17/23	Varies by Element
ICSA	MW21432	03/16/23	03/23/23	Varies by Element
ICSAB	MW21435	03/20/23	03/27/23	Varies by Element
CCV	MW21415	03/02/23	03/25/23	Varies by Element
Internal Standard (ISTD)	N/A	N/A	N/A	0.2 mg/L (Li,Sc,Ge/Y,Tb,Bi)

Additional Comments and Notes:

Samples with ISTD RSDs > 8% were reanalyzed immediately.

ISTD was manually added to all standards and samples (0.08 mL of MS2459 to 8 mL).

Dilutions: Some samples were diluted based on history or due to interfering element concentrations.

Dilution preparations are as follows:

5x diln.: 1.6 mL of sample (pipet M30) + 6.4 mL of MW21411 (pipet M31)

10x diln.: 0.8 mL of sample (pipet M19) + 7.2 mL of MW21411 (pipet M31)

25x diln.: 0.32 mL of sample(pipet M19) + 7.68 mL of MW21411 (pipet M31)

Post Spike: 0.08 mL of MW21329 (pipet M27) into 8 mL final volume of appropriately diluted sample (pipet M31)

KATAHDIN ANALYTICAL SERVICES, LLC
METALS ANALYSIS RUN INFORMATION SHEET

INSTR. ID: L (Agilent 7800) **ANALYST:** KS **ANALYSIS DATE:** 03/23/23

METHOD: ICP-MS
- ☐ 200.8
- ☑ 6020
- ☑ DOD

FILE NAME: LQC24A

Reviewed By: 4-03-27-23

The pHs of all samples that were tested by direct analysis in this analytical run were checked just prior to analysis and confirmed to be <2. The time of preservation of these samples was checked in the "Measured Turbidity and Preservation of Incoming Samples" logbook to verify that they had been preserved at least 16 hours prior to analysis. These verifications were performed by _____ (initials) on _____ (date).

STANDARDS USED:

Standard Name	Standard ID	Prep Date	Expiration Date	Standard Conc.
Cal Blk/ICB/CCB	MW21411	03/02/23	03/02/24	0 ug/L
Cal Std	MW21414	03/02/23	03/25/23	Varies by Element
ICV	MW21429	03/15/23	06/14/23	Varies by Element
PQL	MW21436	03/23/23	03/25/23	Varies by Element
LRS1	MW21330	01/17/23	03/25/23	Varies by Element
LRS2	MW21331	01/17/23	04/17/23	Varies by Element
ICSA	MW21441	03/24/23	03/31/23	Varies by Element
ICSAB	MW21438	03/23/23	03/25/23	Varies by Element
CCV	MW21439	03/23/23	03/25/23	Varies by Element
Internal Standard (ISTD)	N/A	N/A	N/A	0.2 mg/L (Li,Sc,Ge/Y,Tb,Bi)

Additional Comments and Notes:

Samples with ISTD RSDs > 8% were reanalyzed immediately.

ISTD was manually added to all standards and samples (0.08 mL of MS2459 to 8 mL).

Dilutions: Some samples were diluted based on history or due to interfering element concentrations.

Dilution preparations are as follows:

5x diln.: 1.6 mL of sample (pipet M30) + 6.4 mL of MW21411 (pipet M31)

10x diln.: 0.8 mL of sample (pipet M19) + 7.2 mL of MW21411 (pipet M31)

25x diln.: 0.32 mL of sample(pipet M19) + 7.68 mL of MW21411 (pipet M31)

Post Spike: 0.08 mL of MW21329 (pipet M27) into 8 mL final volume of appropriately diluted sample (pipet M31)

KATAHDIN ANALYTICAL SERVICES, LLC
METALS ANALYSIS RUN INFORMATION SHEET

INSTR. ID: L (Agilent 7800) **ANALYST**: KS **ANALYSIS DATE**: 03/28/23

METHOD: **ICP-MS**
- ☑ 200.8
- ☑ 6020
- ☑ DOD

FILE NAME: LQC28E

Reviewed By: EA 033023

The pHs of all samples that were tested by direct analysis in this analytical run were checked just prior to analysis and confirmed to be <2. The time of preservation of these samples was checked in the "Measured Turbidity and Preservation of Incoming Samples" logbook to verify that they had been preserved at least 16 hours prior to analysis. These verifications were performed by _____ (initials) on _____ (date).

STANDARDS USED:

Standard Name	Standard ID	Prep Date	Expiration Date	Standard Conc.
Cal Blk/ICB/CCB	MW21411	03/02/23	03/02/24	0 ug/L
Cal Std	MW21445	03/27/23	05/31/23	Varies by Element
ICV	MW21429	03/15/23	06/14/23	Varies by Element
PQL	MW21447	03/27/23	05/31/23	Varies by Element
LRS1	MW21454	03/28/23	05/31/23	Varies by Element
LRS2	MW21450	03/27/23	05/31/23	Varies by Element
ICSA	MW21441	03/24/23	03/31/23	Varies by Element
ICSAB	MW21448	03/27/23	04/03/23	Varies by Element
CCV	MW21455	03/28/23	05/31/23	Varies by Element
Internal Standard (ISTD)	N/A	N/A	N/A	0.2 mg/L (Li,Sc,Ge/Y,Tb,Bi)

Additional Comments and Notes:

Samples with ISTD RSDs > 8% were reanalyzed immediately.

ISTD was manually added to all standards and samples (0.08 mL of MS2459 to 8 mL).

Dilutions: Some samples were diluted based on history or due to interfering element concentrations.

Dilution preparations are as follows:

5x diln.: 1.6 mL of sample (pipet M30) + 6.4 mL of MW21411 (pipet M31)

10x diln.: 0.8 mL of sample (pipet M19) + 7.2 mL of MW21411 (pipet M31)

25x diln.: 0.32 mL of sample(pipet M19) + 7.68 mL of MW21411 (pipet M31)

Post Spike: 0.08 mL of MW21329 (pipet M27) into 8 mL final volume of appropriately diluted sample (pipet M31)

Sample Data Section

KATAHDIN ANALYTICAL SERVICES – INORGANIC DATA QUALIFIERS

The sampled date indicated on the attached Report(s) of Analysis (ROA) is the date for which a grab sample was collected or the date for which a composite sample was completed. Beginning and start times for composite samples can be found on the Chain-of-Custody.

U Indicates the compound was analyzed for but not detected above the specified level. This level may be the Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client.

Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL "U" LOQ or "U" LOD, where the rate of false negatives is <1%.

E Estimated value. This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis.

J Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), but above the Method Detection Limit (MDL).

I-7 The laboratory's Practical Quantitation Level (PQL) or LOQ could not be achieved for this parameter due to sample composition, matrix effects, sample volume, or quantity used for analysis.

A-4 Please refer to cover letter or narrative for further information.

H_ Please note that the regulatory holding time for _____ is "analyze immediately". Ideally, this analysis must be performed in the field at the time of sample collection. _____ for this sample was not performed at the time of sample collection. The analysis was performed as soon as possible after receipt by the laboratory.

H1 - pH H2 - DO H3 - sulfite H4 - residual chlorine

T1 The client did not provide the full volume of at least one liter for analysis of TSS. Therefore, the PQL of 2.5 mg/L could not be achieved.

T2 The client provided the required volume of at least one liter for analysis of TSS, but the laboratory could not filter the full one liter volume due to the sample matrix. Therefore, the PQL of 2.5 mg/L could not be achieved.

M1 The matrix spike and/or matrix spike duplicate recovery performed on this sample was outside of the laboratory acceptance criteria. Sample matrix is suspected. The laboratory criteria was met for the Laboratory Control Sample (LCS) analyzed concurrently with this sample.

M2 The matrix spike and/or matrix spike duplicate recovery was outside of the laboratory acceptance criteria. The native sample concentration is greater than four times the spike added concentration so the spike added could not be distinguished from the native sample concentration.

R1 The relative percent difference (RPD) between the duplicate analyses performed on this sample was outside of the laboratory acceptance criteria (when both values are greater than ten times the PQL).

MCL	Maximum Contaminant Level	NL	No limit
NFL	No Free Liquid Present	FLP	Free Liquid Present
NOD	No Odor Detected	TON	Threshold Odor Number

D-1 As required by Method 5210B, APHA Standard Methods for the Examination of Water and Wastewater (21st edition), the BOD value reported for this sample is 'qualified' because the check standard run concurrently with the sample analysis did not meet the criteria specified in the method (198 +/- 30.5 mg/L). These results may not be reportable for compliance purposes.

D-2 The measured final dissolved oxygen concentrations of all dilutions were less than the method-specified limit of 1 mg/L. The reported BOD result was calculated assuming a final oxygen concentration equal to 1 mg/L. The reported value should be considered a minimum value.

D-3 The dilution water used to prepare this sample did not meet the method and/or regulatory criteria of less than 0.2 or 0.4 mg/L dissolved oxygen (DO) uptake over the five day period of incubation. These results may not be reportable for compliance purposes.

Acid Volatile Sulfide Calculations

Standardization of Iodine

Iodine Normality = Normality $Na_2S_2O_3$ x mL $Na_2S_2O_3$ / mL I_2

Normality of $Na_2S_2O_3$:		0.0375
Vol (mL) I_2	Vol (mL) 0.0375 N $Na_2S_2O_3$	Calc. Normality I_2	Mean Normality I_2
15	9.97	0.02493	
15	10.05	0.02513	**0.02503**
15	10.01	0.02503	

Standardization of Saturated Na_2S Stock "S1"

$S^=$ (mg/L) = (mL I_2 x Normality I_2) - (mL $Na_2S_2O_3$ x Normality $Na_2S_2O_3$) x 16000 / mL Na_2S Standard

			N $Na_2S_2O_3$:	0.0375
Vol (mL) I_2	Vol (mL) 0.0375 N $Na_2S_2O_3$	Vol (mL) Na_2S	Calc. $S^=$ Conc. (mg/L)	Mean $S^=$ Conc. Of **S1** (mg/L)
30	10.76	0.1	55560	
30	10.67	0.1	56100	**55640**
30	10.81	0.1	55260	

Prep of Sulfide Working Standard "W1"

Stock "S1" Added (mL)	Final Vol (mL)	Calc. Conc. W1(mg/L)
0.1	100	**55.64**

QC Sample Preparation

QC Sample Name (CCV, LCS, MS, etc.)	Source Standard (S1, W2, etc.)	Source Standard Conc.	Source Standard Added (mL)
CCVA	W1	55.64	0.5
CCVB	W2	52.14	0.5
LCS	S1	55640.00	0.1
SQ1188-8 MS	S1	55640.00	0.1

Standardization of Saturated Na_2S Stock "S2"

$S^=$ (mg/L) = (mL I_2 x Normality I_2) - (mL $Na_2S_2O_3$ x Normality $Na_2S_2O_3$) x 16000 / mL Na_2S Standard

			N $Na_2S_2O_3$:	0.0375
Vol (mL) I_2	Vol (mL) 0.0375 N $Na_2S_2O_3$	Vol (mL) Na_2S	Calc. $S^=$ Conc. (mg/L)	Mean $S^=$ Conc. Of **S2** (mg/L)
30	11.48	0.1	51240	
30	11.25	0.1	52620	**52140**
30	11.26	0.1	52560	

Prep of Sulfide Working Standard "W2"

Stock "S2" Added (mL)	Final Vol (mL)	Calc. Conc. W2 (mg/L)
0.1	100	**52.14**

Calibration Standards

mL Working Std. "W2" Used	Abs. At 670 nm	Sulfide (ug) in Cal. Std.	Sulfide (umole) in Cal. Std.

myEOL

Eurofins Lancaster Laboratories Environment Testing, LLC

Job Notes

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Authorization

Generated
3/23/2023 1:18 PM

Authorized for release by
Stephen J Gordon, Senior Project Manager

Eurofins Lancaster Laboratories Environment Testing, LLC

Compliance Statement

Analytical test results meet all requirements of the associated regulatory program (e.g., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis. Data qualifiers are applied to note exceptions. Noncompliant quality control (QC) is further explained in narrative comments.
· QC results that exceed the upper limits and are associated with non-detect samples are qualified but further narration is not required since the bias is high and does not change a non-detect result. Further narration is also not required with QC blank detection when the associated sample concentration is non-detect or more than ten times the level in the blank.
· Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD is performed, unless otherwise specified in the method.
· Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.
Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Measurement uncertainty values, as applicable, are available upon request.

Test results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" and tested in the laboratory are not performed within 15 minutes of collection.

This report shall not be reproduced except in full, without the written approval of the laboratory.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. The foregoing express warranty is exclusive and is given in lieu of all other warranties, expressed or implied, except as otherwise agreed. We disclaim any other warranties, expressed or implied, including a warranty of fitness for particular purpose and warranty of merchantability. In no event shall Eurofins Lancaster Laboratories Environmental, LLC be liable for indirect, special, consequential, or incidental damages including, but not limited to, damages for loss of profit or goodwill regardless of (A) the negligence (either sole or concurrent) of Eurofins Lancaster Laboratories Environmental and (B) whether Eurofins Lancaster Laboratories Environmental has been informed of the possibility of such damages. We accept no legal responsibility for the purposes for which the client uses the test results. Except as otherwise agreed, no purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
410-119054-1

Receipt
The samples were received on 3/16/2023 9:38 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 4.0°C

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Accreditation/Certification Summary

Client: Katahdin Analytical Services
Job ID: 410-119054-1
Project/Site: SQ118

Laboratory: Eurofins Lancaster Laboratories Environment Testing, LLC

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
A2LA	Dept. of Defense ELAP	0001.01	11-30-24

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
Lloyd Kahn		Solid	Total Organic Carbon
Moisture		Solid	Percent Moisture

▪ Certificate of Analysis ▪

1. The **Certified Values** are the actual "made-to" concentrations confirmed by ERA analytical verification. The certified values are monitored and purchasers will be notified of any significant changes resulting in recertification or withdrawal of this certified reference material during the period of validity of this certificate.

2. The **Uncertainty** represents an expanded uncertainty and approximates a 95% confidence interval. The uncertainty is based on the characterization, homogeneity and stability characteristics of the product, multiplied by a coverage factor (k=2). The uncertainty applies to the product as supplied and does not take into account any required or optional dilution and/or preparations the laboratory may perform while using this product. The formula used to calculate the expanded uncertainty is:
$U_{expanded} = k * SQRT((U_{char}^2) + (U_{homogen}^2) + (U_{LTS}^2) + (U_{STS}^2) + (U_{RSS}^2))$

Where:

$U_{expanded}$ = Expanded uncertainty.
k = Coverage factor.
U_{char} = Combined standard uncertainty of the manufacturing and/or analytical verification assessment.
$U_{homogen}$ = Standard uncertainty of the homogeneity assessment.
U_{LTS} = Standard uncertainty associated with long-term stability.
U_{STS} = Standard uncertainty associated with short-term (transport) stability.
U_{RSS} = Standard uncertainty associated with repeated sampling of the product (where permitted by product use instructions).

3. The **QC Performance Acceptance Limits (QC PALs™)** are based on actual historical data collected in ERA's Proficiency Testing program. The QC PALs™ reflect any inherent biases in the methods used to establish the limits and closely approximate a 95% confidence interval of the performance that experienced laboratories should achieve using accepted environmental methods. Use the QC PALs™ to realistically evaluate your performance against your peers.

4. The **PT Performance Acceptance Limits (PT PALs™)** are calculated using the regression equations and fixed acceptance criteria specified in the NELAC proficiency testing requirements. Use the PT PALs™ when analyzing this certified reference material alongside USEPA and NELAC compliant PT study materials. Please note that many PT study acceptance limits are concentration dependent (some non-linearly) and therefore, the acceptance limits of this certified reference material and any PT study material may differ relative to their difference in concentrations.

5. The **PT Performance Data** include the mean value, percent recovery and number of data points reported by laboratories in our Proficiency Testing study compared to the Certified Values. In the event this lot was not used in a proficiency testing scheme, the data displayed was generated internally by ERA.

6. Where NIST Standard Reference Materials (SRMs) are available, each analyte has been analytically traced to the NIST SRM listed. **Analytical Traceability Recovery (%)** = [(% recovery ERA certified reference material)/(% recovery NIST SRM)]*100
The traceability data shown were compiled by analyzing this ERA certified reference material and/or it's associated stock solution(s) against the applicable NIST SRMs.

7. The **Reference Values** are equal to the mean recoveries for the parameters as determined in an interlaboratory round robin study. The **Reference Values** represent the expected performance for the analytes in this standard. ERA recommends using the **Reference Values** when assessing or evaluating your results.

8. **Metrological Traceability**. This certified reference material is metrologically traceable to NIST mass reference materials through an unbroken chain of comparisons.

9. For additional information on this product such as intended use, storage information, instructions for use, minimum sample size, and safety information, please refer to the Product Use Instructions provided.

If you have any questions or need technical assistance, please call ERA technical assistance at 1-800-372-0122 or send an email to info@eraqc.com.

A Waters Company

Certified Reference Material

▪ Certificate of Analysis ▪

Product: Nutrients in Soil
Catalog Number: 542
Lot No. D113-542
Certificate Issue Date: March 23, 2021
Expiration Date: October 13, 2024
Revision Number: Original

Product use instructions are included as part of the certification packet and are paginated separately from this Certificate of Analysis. Please reference the product use instructions for catalog #542 revision 090119.

CERTIFICATION

Parameter	Certified Value[1]	Reference Value[7]	Uncertainty[2]	QC Performance Acceptance Limits[3]	PT Performance Acceptance Limits[4]
	mg/kg	mg/kg	%	mg/kg	mg/kg
Ammonia as N	1210	1090	6.25	698 - 1470	665 - 1510
Total Kjeldahl Nitrogen	1720	1700	12.5	1100 - 2300	944 - 2460
Total Organic Carbon (TOC)	5000	4690	9.55	1690 - 7680	1610 - 7770
Total Phosphorus	1710	1570	20.5	828 - 2300	439 - 2690

NARRATIVE
KATAHDIN ANALYTICAL SERVICES
EA ENGINEERING, SCIENCE, AND TECHNOLOGY
ORA – MUTIPLE SITES FY18-22- FORT JACKSON
SQ1201

Sample Receipt

The following samples were received on March 10 and 13, 2023 and were logged in under Katahdin Analytical Services work order number SQ1201 for a hardcopy due date of March 24, 2023.

KATAHDIN Sample No.	EA ENGINEERING Sample Identification
SQ1201-1	SWDUP
SQ1201-2	JACKSON-SWMC3-DC-01
SQ1201-3	JACKSON-SWMC2-DC-01
SQ1201-4	JACKSON-SWJC1-DC-01
SQ1201-5	JACKSON-SWMC1-DC-01
SQ1201-6	JACKSON-SWCC3-DC-01
SQ1201-7	JACKSON-SWCC4-DC-01
SQ1201-8	JACKSON-SWCC2-DC-01
SQ1201-9	JACKSON-EB-01
SQ1201-10	JACKSON-CB-01
SQ1201-11	SWDUP
SQ1201-12	JACKSON-SWMC3-DC-01
SQ1201-13	JACKSON-SWMC2-DC-01
SQ1201-14	JACKSON-SWJC1-DC-01
SQ1201-15	JACKSON-SWMC1-DC-01
SQ1201-16	JACKSON-SWCC3-DC-01
SQ1201-17	JACKSON-SWCC4-DC-01
SQ1201-18	JACKSON-SWCC2-DC-01

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAP standards unless otherwise noted in this narrative or in the Report of Analysis.

We certify that the test results provided in this report are accredited under the laboratory's ISO/IEC 17025:2017 and DoD-ELAP accreditation issued by the ANSI-ASQ National Accreditation Board. Refer to certificate and scope of accreditation L2223.

Analytes which are reported but not listed on our ANAB scope of accreditation will be "^" flagged and the following language will be included in the case narrative for all DoD compliant work: "^"

Indicates this analyte is not included on Katahdin Analytical Services DoD-ELAP Scope of Accreditation.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Heather Manz**. This narrative is an integral part of the Report of Analysis.

Organics Analysis

The samples of SQ1201 were analyzed in accordance with Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, EPA publication SW-846, Third Edition, Final Updates I (1993), II (1995), IIA (1994), IIB (1995), III (1997), IIIA (1999), IIIB (2005), IV (2008), V (2015) and VI (2019), and/or for the specific methods listed below or on the Report of Analysis.

Sample SQ1201-2 was used for the Matrix Spike (MS) and Matrix Spike Duplicate (MSD), as requested by the client.

8330B Analysis

Sample SQ1201-4 had a low recovery for the extraction surrogate 1,2-dinitrobenzene which was outside the DoD QSM acceptance limits. Based on the laboratory reporting difficulties during the extraction process, the deviation is likely attributable to a matrix effect. Therefore, no further action was taken.

All samples were initially analyzed on the primary Phenomenex column. If a sample has a peak that is within the retention time window of a target analyte and the concentration is above the PQL, the sample is reanalyzed for confirmation on the confirmation Acclaim E2 column. An analyte is considered confirmed if the mentioned criteria are achieved with both columns. The results from the primary column are reported.

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are based on the DoD QSM acceptance limits for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is to take corrective action only if the number of spiked analytes in the LCS that are outside of the QC limits is greater than the DoD QSM allowable number of exceedances, which is one. If the associated MS/MSD has greater than the allowable number of exceedances, no corrective action is taken, as long as the LCS is acceptable.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of Katahdin Work Order SQ1201 were prepared and analyzed for metals in accordance with Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, EPA

publication SW-846, Third Edition, Final Updates I (1993), II (1995), IIA (1994), IIB (1995), III (1997), IIIA (1999), IIIB (2005), IV (2008), V (2015), and VI (2019). Office of Solid Waste and Emergency Response, U.S. EPA.

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP)

Aqueous-matrix Katahdin Sample Numbers SQ1201-(1-8) were digested for ICP analysis on 03/16/2023 (QC Batch QC16ICW1) in accordance with USEPA Method 3010A. Per client request, Katahdin Sample Number SQ1201-2 was prepared with duplicate matrix-spiked aliquots.

ICP analyses of Katahdin Work Order SQ1201 sample digestates were performed using a Thermo iCAP 6500 ICP spectrometer in accordance with USEPA Method 6010C. All samples were analyzed within holding times and all analytical run QC criteria were met with the following exception:

The ICSA standard analyzed on ICP run IQC20A was outside project acceptance criteria for potassium. Accepted results were either less than ½ LOQ or greater than 10x the failing value of the standard.

Inductively-Coupled Plasma Mass Spectrometric Analysis (ICP-MS)

Aqueous-matrix Katahdin Sample Numbers SQ1201-(9-18) were digested for ICP-MS analysis on 03/21/2023 (QC Batch QC21IMW2) in accordance with USEPA Method 3010A. Per client request, Katahdin Sample Number SQ1201-12 was prepared with duplicate matrix-spiked aliquots.

ICP-MS analyses of Katahdin Work Order SQ1201 sample digestates were performed using an Agilent 7800 ICP-MS spectrometer in accordance with USEPA Method 6020A. Results for all standards and samples are reported using the mean of 3 replicate measurements. All sample digestates were diluted by a factor of 5 during analysis to reduce mass interferences from chlorine, which is present in the digestates from the hydrochloric acid used in digesting the samples. All samples were analyzed within holding times and all analytical run QC criteria were met with the following exceptions:

The CCB standard analyzed at 18:30 on ICP-MS run LQC24A was outside the project acceptance criteria for calcium and magnesium. All accepted results were greater than 10 times the failing value or less than ½ LOQ, except the magnesium result for the serial dilution aliquot of Katahdin Sample Number SQ1201-12.

The CCV standard analyzed at 23:46 on ICP-MS run LQC30A was outside the project acceptance criteria for magnesium. Katahdin sample number SQ1201-10 was accepted without corrective action, as the result was less than ½ LOQ. Katahdin sample number SQ1201-9 was accepted without corrective action per client request.

Internal standard recoveries for ICP-MS analyses can be found in the raw data section of the accompanying data package. The following table indicates which analytes are associated with each internal standard element.

Internal Standard Element	Associated Analytes
Lithium	Beryllium, Boron
Scandium	Sodium, Magnesium, Aluminum, Potassium, Calcium
Germanium or Yttrium	Vanadium, Chromium, Manganese, Iron, Cobalt, Nickel, Copper, Zinc, Arsenic, Selenium, Silver, Cadmium, Strontium, Molybdenum
Terbium	Antimony, Barium, Tin, Tungsten
Bismuth	Lead, Thallium, Thorium, Uranium

Instrument tuning information can also be found in the raw data section in the reports labeled "USEPA Method Tune Report". For Method 6020A, the relative standard deviation was determined from 5 replicate measurements and the peak width was measured at 10% of the peak height.

Matrix QC Summary

All matrix QC results are within project acceptance limits.

Reporting of Metals Results

Per client request, analytical results for client samples on Form I and preparation blanks on Form IIIP have been reported using the laboratory's limits of detection (LOD). All results were evaluated down to the laboratory's method detection limits (MDLs). Results that fall between the MDL and the LOQ are flagged with "J" in the C-qualifier column, and the measured concentration appears in the concentration column. Results that are less than the MDL are flagged with "U" in the C-qualifier column, and the LOD is listed in the concentration column. These LOQs, MDLs and LODs have been adjusted for each sample based on the sample amounts used in preparation and analysis.

Analytical results on Forms VA, VD, VII, and IX for client samples, matrix QC samples (duplicates and matrix spikes), and laboratory control samples have been reported down to the laboratory's method detection limits (MDLs). Analytical results that are below the MDLs are flagged with "U" in the C-qualifier column, and the adjusted LOD is listed in the concentration column.

Analytical results for instrument run QC samples (ICVs, ICBs, etc.) have been reported down to the laboratory's instrument detection limits (IDLs).

IDLs, LODs, MDLs, and LOQs are listed on Form 10 of the accompanying data package.

Wet Chemistry Analysis

The samples of Katahdin Work Order SQ1201 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for sulfate and chloride were performed according to “Methods for the Determination of Inorganic Substances in Environmental Samples”, EPA 600/R-93/100, August 1993.

Analyses for alkalinity were performed according to "Standard Methods for the Examination of Water and Wastewater", 15th, 16th, 17th, 18th, 19th, and 20th editions, 1980, 1985, 1989, 1992, 1995, 1999. APHA-AWWA-WPCF.

All Wet Chemistry results were evaluated to Katahdin Analytical Services’ Method Detection Limits (MDL). Measured concentrations that fall between the MDL and Katahdin’s Limit of Quantitation (LOQ) are flagged “J”. Measured concentrations that are below the MDL are flagged “U” and reported as “U LOD”, where “LOD” is the numerical value of the Limit of Detection.

All quality control criteria were met. All analyses were performed within analytical holding time with the following exception:

The sub lab contacted us to let us know that they did not receive a bottle for the alkalinity analysis of SQ1201-8, so we analyzed the sample in house. By this time the sample was already out of hold. The alkalinity analysis for SQ1201-8 was performed on day 16 of the 14-day analytical holding time. The client was contacted.

Subcontracted Data

Analyses for Perchlorate by Method SW6850, DOC by method SW9060 and Alkalinity by method SM2320B were performed by subcontract laboratories. Please refer to the sections of the data package titled Subcontracted Data.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Quality Assurance Officer, or their designee, as verified by the following signature.

04/11/2023

Katahdin Analytical Services, Inc.

Manual Integration Codes For GC/MS, GC, HPLC and/or IC

M1	Peak splitting.
M2	Well defined peaks on the shoulders of the other peaks.
M3	There is additional area due to a coeluting interferant.
M4	There are negative spikes in the baseline.
M5	There are rising or falling baselines.
M6	The software has failed to detect a peak or misidentified a peak.
M7	Excessive peak tailing.
M8	Analysis such as GRO, DRO and TPH require a baseline hold.
M9	Peak was not completely integrated as in GC/MS.
M10	Primary ion was correctly integrated, but secondary or tertiary ion needed manual integration as in GC/MS.
M11	For GC analysis, when a sample is diluted by 1:10 or more, the surrogate is set to undetected and then the area under the surrogate is manually integrated.
M12	Manual integration saved in method due to TurboChrom floating point error.

SAMPLE DATA SUMMARY PACKAGE

KATAHDIN ANALYTICAL SERVICES - ORGANIC DATA QUALIFIERS

U Indicates the compound was analyzed for but not detected above the specified level. This level may be the Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client.

Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL, "U" LOQ or "U" LOD, where the rate of false negatives is <1%.

* Compound recovery or percent RPD (relative percent difference) was outside of quality control limits.

D Indicates the result was obtained from analysis of a diluted sample. Surrogate recoveries may not be calculable.

E Estimated value. This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis.

J Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), but above the Method Detection Limit (MDL).

And/or

J Used for Dual Column analytes when there is a greater than 40% difference for detected concentrations between the two GC/HPLC columns.

B Indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample.

I Indicates that the flagged compound did not meet DoD criteria in the corresponding Initial Calibration (ICAL).

D Indicates that the flagged compound did not meet DoD criteria in the corresponding Initial Calibration Verification (ICV).

C Indicates that the flagged compound did not meet DoD criteria in the corresponding opening Calibration Verification (CV).

V Indicates that the flagged compound did not meet DoD criteria in the corresponding closing Calibration Verification (CV).

L/LL Indicates that the flagged compound did not meet DoD criteria in the corresponding Laboratory Control Sample (LCS) and/or Laboratory Control Sample Duplicate (LCSD) prepared and/or analyzed concurrently with the sample.

M/MM Indicates that the flagged compound did not meet DoD criteria in the Matrix Spike (MS) and/or Matrix Spike Duplicate MSD) prepared and/or analyzed concurrently with the native sample.

H Indicates the flagged compound was detected on the primary column but was not detected on the confirmation column therefore the compound is not reported as a positive detection. (SW846 8330A/B only)

METALS SAMPLE FLAGGING

FLAG	SPECIFIED MEANING
E	The reported value is estimated because of the presence of interference (as indicated by serial dilution).
N	The pre-digestion spiked sample recovery is not within control limits.
*	The duplicate sample analysis relative percent difference (RPD) is not within control limits.
B	Indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample.
A	The post-digestion spiked sample recovery is not within control limits.
•	Analytical run QC sample (e.g. ICV, CCV, ICB, CCB, ICSA, ICSAB) not within control limits.
U	The analyte was not detected above the specified level. This level may be the Limit of Quantitation (LOQ) (previously called Practical Quantitation Level (PQL)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client. Note: All results reported as “U” MDL have a 50% rate for false negatives compared to those results reported as “U” PQL/LOQ or “U” LOD, where the rate of false negatives is <1%.
J	The analyte was detected in the sample at a concentration less than the laboratory Limit of Quantitation (LOQ) (previously called Practical Quantitation Limit (PQL)), but above the Method Detection Limit (MDL).
Q	One or more quality control criteria failed (e.g., LCS recovery, surrogate spike recovery or CCV).

KATAHDIN ANALYTICAL SERVICES – INORGANIC DATA QUALIFIERS

The sampled date indicated on the attached Report(s) of Analysis (ROA) is the date for which a grab sample was collected or the date for which a composite sample was completed. Beginning and start times for composite samples can be found on the Chain-of-Custody.

U Indicates the compound was analyzed for but not detected above the specified level. This level may be the Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client.

Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL "U" LOQ or "U" LOD, where the rate of false negatives is <1%.

E Estimated value. This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis.

J Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), but above the Method Detection Limit (MDL).

I-7 The laboratory's Practical Quantitation Level (PQL) or LOQ could not be achieved for this parameter due to sample composition, matrix effects, sample volume, or quantity used for analysis.

A-4 Please refer to cover letter or narrative for further information.

H_ Please note that the regulatory holding time for _____ is "analyze immediately". Ideally, this analysis must be performed in the field at the time of sample collection. _____ for this sample was not performed at the time of sample collection. The analysis was performed as soon as possible after receipt by the laboratory.

H1 - pH H2 - DO H3 - sulfite H4 - residual chlorine

T1 The client did not provide the full volume of at least one liter for analysis of TSS. Therefore, the PQL of 2.5 mg/L could not be achieved.

T2 The client provided the required volume of at least one liter for analysis of TSS, but the laboratory could not filter the full one liter volume due to the sample matrix. Therefore, the PQL of 2.5 mg/L could not be achieved.

M1 The matrix spike and/or matrix spike duplicate recovery performed on this sample was outside of the laboratory acceptance criteria. Sample matrix is suspected. The laboratory criteria was met for the Laboratory Control Sample (LCS) analyzed concurrently with this sample.

M2 The matrix spike and/or matrix spike duplicate recovery was outside of the laboratory acceptance criteria. The native sample concentration is greater than four times the spike added concentration so the spike added could not be distinguished from the native sample concentration.

R1 The relative percent difference (RPD) between the duplicate analyses performed on this sample was outside of the laboratory acceptance criteria (when both values are greater than ten times the PQL).

MCL	Maximum Contaminant Level	NL	No limit
NFL	No Free Liquid Present	FLP	Free Liquid Present
NOD	No Odor Detected	TON	Threshold Odor Number

D-1 As required by Method 5210B, APHA Standard Methods for the Examination of Water and Wastewater (21st edition), the BOD value reported for this sample is 'qualified' because the check standard run concurrently with the sample analysis did not meet the criteria specified in the method (198 +/- 30.5 mg/L). These results may not be reportable for compliance purposes.

D-2 The measured final dissolved oxygen concentrations of all dilutions were less than the method-specified limit of 1 mg/L. The reported BOD result was calculated assuming a final oxygen concentration equal to 1 mg/L. The reported value should be considered a minimum value.

D-3 The dilution water used to prepare this sample did not meet the method and/or regulatory criteria of less than 0.2 or 0.4 mg/L dissolved oxygen (DO) uptake over the five day period of incubation. These results may not be reportable for compliance purposes.

Sample Data Section

KATAHDIN ANALYTICAL SERVICES - ORGANIC DATA QUALIFIERS

U Indicates the compound was analyzed for but not detected above the specified level. This level may be the Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client.

Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL, "U" LOQ or "U" LOD, where the rate of false negatives is <1%.

* Compound recovery or percent RPD (relative percent difference) was outside of quality control limits.

D Indicates the result was obtained from analysis of a diluted sample. Surrogate recoveries may not be calculable.

E Estimated value. This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis.

J Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), but above the Method Detection Limit (MDL).

And/or

J Used for Dual Column analytes when there is a greater than 40% difference for detected concentrations between the two GC/HPLC columns.

B Indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample.

I Indicates that the flagged compound did not meet DoD criteria in the corresponding Initial Calibration (ICAL).

D Indicates that the flagged compound did not meet DoD criteria in the corresponding Initial Calibration Verification (ICV).

C Indicates that the flagged compound did not meet DoD criteria in the corresponding opening Calibration Verification (CV).

V Indicates that the flagged compound did not meet DoD criteria in the corresponding closing Calibration Verification (CV).

L/LL Indicates that the flagged compound did not meet DoD criteria in the corresponding Laboratory Control Sample (LCS) and/or Laboratory Control Sample Duplicate (LCSD) prepared and/or analyzed concurrently with the sample.

M/MM Indicates that the flagged compound did not meet DoD criteria in the Matrix Spike (MS) and/or Matrix Spike Duplicate MSD) prepared and/or analyzed concurrently with the native sample.

H Indicates the flagged compound was detected on the primary column but was not detected on the confirmation column therefore the compound is not reported as a positive detection. (SW846 8330A/B only)

Katahdin Analytical Services, Inc.

Manual Integration Codes For GC/MS, GC, HPLC and/or IC

M1	Peak splitting.
M2	Well defined peaks on the shoulders of the other peaks.
M3	There is additional area due to a coeluting interferant.
M4	There are negative spikes in the baseline.
M5	There are rising or falling baselines.
M6	The software has failed to detect a peak or misidentified a peak.
M7	Excessive peak tailing.
M8	Analysis such as GRO, DRO and TPH require a baseline hold.
M9	Peak was not completely integrated as in GC/MS.
M10	Primary ion was correctly integrated, but secondary or tertiary ion needed manual integration as in GC/MS.
M11	For GC analysis, when a sample is diluted by 1:10 or more, the surrogate is set to undetected and then the area under the surrogate is manually integrated.
M12	Manual integration saved in method due to TurboChrom floating point error.

*** END LIST ***

Danger

Storage: **Freezer**

Highly flammable liquid and vapour. Toxic if inhaled. Causes damage to the central nervous system and the visual organs.
If medical advice is needed, have product container or label at hand. Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking. Use explosion-proof electrical/ventilating/lighting/ equipment. Do not breathe dust/ fume/ gas/ mist/ vapours/ spray. IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water/shower. Dispose of contents/container in accordance with local/regional/national/international regulations.

METALS DATA

Sample Data Section

METALS SAMPLE FLAGGING

FLAG	SPECIFIED MEANING
E	The reported value is estimated because of the presence of interference (as indicated by serial dilution).
N	The pre-digestion spiked sample recovery is not within control limits.
*	The duplicate sample analysis relative percent difference (RPD) is not within control limits.
B	Indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample.
A	The post-digestion spiked sample recovery is not within control limits.
•	Analytical run QC sample (e.g. ICV, CCV, ICB, CCB, ICSA, ICSAB) not within control limits.
U	The analyte was not detected above the specified level. This level may be the Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), the Limit of Detection (LOD) or Method Detection Limit (MDL) as required by the client. Note: All results reported as "U" MDL have a 50% rate for false negatives compared to those results reported as "U" PQL, "U" LOQ or "U" LOD, where the rate of false negatives is <1%.
J	Estimated value. The analyte was detected in the sample at a concentration less than the laboratory Practical Quantitation Level (PQL) (also called Limit of Quantitation (LOQ)), but above the Method Detection Limit (MDL).
Q	One or more quality control criteria failed (e.g., LCS recovery, surrogate spike recovery or CCV).

FILE NAME: IQC17A

Reviewed By: Ean 032023

The pHs of all samples that were tested by direct analysis in this analytical run were checked just prior to analysis and confirmed to be <2. The time of preservation of these samples was checked in the "Measured Turbidity and Preservation of Incoming Samples" logbook to verify that they had been preserved at least 16 hours prior to analysis. These verifications were performed by ____ (initials) on ____ (date).

STANDARDS USED:

Standard Name	Standard ID	Prep Date	Expiration Date	Standard Conc.
Cal. Blk/ICB/CCB	MW21420	03/03/2023	06/03/2023	0 ug/L
Standard 1	MW21417	03/02/2023	06/02/2023	Varies by Element
ICV	MW21424	03/08/2023	03/31/2023	Varies by Element
PQL	MW21396409	3/1 02/24/2023	5/31 05/24/2023	Varies by Element

ICSA	MW21384	02/16/2023	05/16/2023	Varies by Element
ICSAB	MW21317	01/11/2023	04/11/2023	Varies by Element
CCV	MW21433	03/17/2023	06/17/2023	Varies by Element
Internal Standard	MW21375	02/09/2023	05/09/2023	5.0 mg/L Yttrium

Ean 032023

Additional Comments and Notes:

3x diln.: 3.0 mL of sample (pipet M30) + 6.0 mL of MW21420 (pipet M31)

2x diln.: 4.0 mL of sample (pipet M30) + 4.0 mL of MW21420 (pipet M31)

10x diln.: 0.8 mL of sample (pipet M19) + 7.2 mL of MW21420 (pipet M31)

5x diln.: 1.6 mL of sample (pipet M30) + 6.4 mL of MW21420 (pipet M31)

25x diln.: 0.4mL of (pipet M19) + 9.6 mL of MW21420 (pipet M31)

Post Spike: 4ul MS2399 (pipet M17), 80ul MS2411 (pipet M27), 40ul MS2444 (pipet M27), 40ul MS2401 (pipet M27) to 8.0mL of sample (pipet M31)

KATAHDIN ANALYTICAL SERVICES, LLC
METALS ANALYSIS RUN INFORMATION SHEET

INSTR. ID: I (Thermo iCAP 6500) **ANALYST**: BCF **ANALYSIS DATE**: 03/20/2023

METHOD: ICP
- ☑ 200.7
- ☑ 6010
- ☑ DOD
- ☐ _____

FILE NAME: iQC20A

Reviewed By: BCF 032123

The pHs of all samples that were tested by direct analysis in this analytical run were checked just prior to analysis and confirmed to be <2. The time of preservation of these samples was checked in the "Measured Turbidity and Preservation of Incoming Samples" logbook to verify that they had been preserved at least 16 hours prior to analysis. These verifications were performed by _____ (initials) on _____ (date).

STANDARDS USED:

Standard Name	Standard ID	Prep Date	Expiration Date	Standard Conc.

BCF 033023

Additional Comments and Notes:

- Accepted < ½ PQL for Sn
- Accepted < ½ PQL and 10x FV (8.362mg/L) for K due to ICSA failure
- Used 2nd CCV as main CCV for 200.7 data

BCF 3-21-23

3x diln.: 3.0 mL of sample (pipet M30) + 6.0 mL of MW21420 (pipet M31)

2x diln.: 4.0 mL of sample (pipet M30) + 4.0 mL of MW21420 (pipet M31)

10x diln.: 0.8 mL of sample (pipet M19) + 7.2 mL of MW21420 (pipet M31)

5x diln.: 1.6 mL of sample (pipet M30) + 6.4 mL of MW21420 (pipet M31)

25x diln.: 0.4mL of (pipet M19) + 9.6 mL of MW21420 (pipet M31)

KATAHDIN ANALYTICAL SERVICES, LLC
METALS ANALYSIS RUN INFORMATION SHEET

INSTR. ID: I (Thermo iCAP 6500) **ANALYST**: BCF **ANALYSIS DATE**: 03/21/2023

METHOD: ICP
- ☑ 200.7
- ☑ 6010
- ☑ DOD
- ☐ _____

FILE NAME: IQC21A

Reviewed By: 3/22/23

The pHs of all samples that were tested by direct analysis in this analytical run were checked just prior to analysis and confirmed to be <2. The time of preservation of these samples was checked in the "Measured Turbidity and Preservation of Incoming Samples" logbook to verify that they had been preserved at least 16 hours prior to analysis. These verifications were performed by _____ (initials) on _____ (date).

STANDARDS USED:

Standard Name	Standard ID	Prep Date	Expiration Date	Standard Conc.

KATAHDIN ANALYTICAL SERVICES, LLC
METALS ANALYSIS RUN INFORMATION SHEET

INSTR. ID: L (Agilent 7800) **ANALYST:** KS **ANALYSIS DATE:** 03/23/23

METHOD: ICP-MS
- ☐ 200.8
- ☑ 6020
- ☑ DOD

FILE NAME: LQC23C

Reviewed By: EE 032423

The pHs of all samples that were tested by direct analysis in this analytical run were checked just prior to analysis and confirmed to be <2. The time of preservation of these samples was checked in the "Measured Turbidity and Preservation of Incoming Samples" logbook to verify that they had been preserved at least 16 hours prior to analysis. These verifications were performed by ——— (initials) on ——— (date).

STANDARDS USED:

Standard Name	Standard ID	Prep Date	Expiration Date	Standard Conc.
Cal Blk/ICB/CCB	MW21411	03/02/23	03/02/24	0 ug/L
Cal Std	MW21414	03/02/23	03/25/23	Varies by Element
ICV	MW21429	03/15/23	06/14/23	Varies by Element
PQL	MW21436	03/23/23	03/25/23	Varies by Element
LRS1	MW21330	01/17/23	03/25/23	Varies by Element
LRS2	MW21331	01/17/23	04/17/23	Varies by Element
ICSA	MW21437	03/23/23	03/30/23	Varies by Element
ICSAB	MW21438	03/23/23	03/25/23	Varies by Element
CCV	MW21439	03/23/23	03/25/23	Varies by Element
Internal Standard (ISTD)	N/A	N/A	N/A	0.2 mg/L (Li,Sc,Ge/Y,Tb,Bi)

Additional Comments and Notes:

Samples with ISTD RSDs > 8% were reanalyzed immediately.

ISTD was manually added to all standards and samples (0.08 mL of MS2459 to 8 mL).

Dilutions: Some samples were diluted based on history or due to interfering element concentrations.

Dilution preparations are as follows:

5x diln.: 1.6 mL of sample (pipet M30) + 6.4 mL of MW21411 (pipet M31)

10x diln.: 0.8 mL of sample (pipet M19) + 7.2 mL of MW21411 (pipet M31)

25x diln.: 0.32 mL of sample(pipet M19) + 7.68 mL of MW21411 (pipet M31)

Post Spike: 0.08 mL of MW21329 (pipet M27) into 8 mL final volume of appropriately diluted sample (pipet M31)

KATAHDIN ANALYTICAL SERVICES, LLC
METALS ANALYSIS RUN INFORMATION SHEET

INSTR. ID: L (Agilent 7800) **ANALYST:** KS **ANALYSIS DATE:** 03/23/23

METHOD: ICP-MS
- ☐ 200.8
- ☑ 6020
- ☑ DOD

FILE NAME: LQC24A

Reviewed By: 4-03-27-23

The pHs of all samples that were tested by direct analysis in this analytical run were checked just prior to analysis and confirmed to be <2. The time of preservation of these samples was checked in the "Measured Turbidity and Preservation of Incoming Samples" logbook to verify that they had been preserved at least 16 hours prior to analysis. These verifications were performed by _____ (initials) on _____ (date).

STANDARDS USED:

Standard Name	Standard ID	Prep Date	Expiration Date	Standard Conc.
Cal Blk/ICB/CCB	MW21411	03/02/23	03/02/24	0 ug/L
Cal Std	MW21414	03/02/23	03/25/23	Varies by Element
ICV	MW21429	03/15/23	06/14/23	Varies by Element
PQL	MW21436	03/23/23	03/25/23	Varies by Element
LRS1	MW21330	01/17/23	03/25/23	Varies by Element
LRS2	MW21331	01/17/23	04/17/23	Varies by Element
ICSA	MW21441	03/24/23	03/31/23	Varies by Element
ICSAB	MW21438	03/23/23	03/25/23	Varies by Element
CCV	MW21439	03/23/23	03/25/23	Varies by Element
Internal Standard (ISTD)	N/A	N/A	N/A	0.2 mg/L (Li,Sc,Ge/Y,Tb,Bi)

Additional Comments and Notes:

Samples with ISTD RSDs > 8% were reanalyzed immediately.

ISTD was manually added to all standards and samples (0.08 mL of MS2459 to 8 mL).

Dilutions: Some samples were diluted based on history or due to interfering element concentrations.

Dilution preparations are as follows:

5x diln.: 1.6 mL of sample (pipet M30) + 6.4 mL of MW21411 (pipet M31)

10x diln.: 0.8 mL of sample (pipet M19) + 7.2 mL of MW21411 (pipet M31)

25x diln.: 0.32 mL of sample(pipet M19) + 7.68 mL of MW21411 (pipet M31)

Post Spike: 0.08 mL of MW21329 (pipet M27) into 8 mL final volume of appropriately diluted sample (pipet M31)
